the diabetic child is recognized as not only precocious in his skeleton and in his height, but above all in his mentality. These unusual intellects should be fostered at the same time we strive to eliminate the accompanying harmful attributes of the disease which sips their efficiency

The diabetic presents a laboratory for study in With our former method of caring for him he succumbed to coma, today the life of every other one ends in some phase of arterioschoosis-premature old age. Therefore, whenever we see a diabetic who has lived above the average diabetic duration of life, we should any lize that individual case in order to learn the explanation of his longevity. And since so many diabetics die of arteriosclerosis we should concentrate upon this phase of the disease as our arbeit knowing its solution will help to defer old uge for us all

to my gratification I have learned that 120 of my living diabetics have already fixed longer with their disease than they were entitled to live according to life expectancy tables when they contracted it To this number 43 others could be idded if they only survive this present year

Freatment Our knowledge of the treatment of diabetes is largely empirical. In this Academy within a decade I have listened to earnest and honest advocatés, whom we all respect, champion either an extremely low carbohydrate diet or an extremely high carbohydrate diet The two schools have expressed themselves positively and, to put it mildly, it has been rather hard for either to allow that their regimes were not the best and should supplant all others I confess I have seen certain diabetic cases do better than my average diabetic although following quite dissimilar lines of treatment from my own. This is undoubtedly due in many instances to my average being too low but we must recognize that a diabetic under careful supervision and in touch with his physi-cian gets on well. This can be explained in part because ill schools recognize and adhere to cer tun fundamental concepts (1) that a diabetical must never be overfed and for this we thin that Dr Allen most of all, (2) that the protein assiment that should approximate that of the norm the basis vidual, varying in accordance with his ar-

3 grams per kilogram body weight f voung child to three quarters of a get, which prob-alization and al-

Fat at one time formed the mained to share the of the diabetic diet and we know the same assemblishe restrictedly, led to comi Even r industrials Ti taken than many of us thought trainzed like smb sen's acute sateration and failed to utilize their carbohydrate were kept so at the smb supplied of the combination of the combination of the calories verged on the combination of the smb supplied of the combination of the smb supplied of the combination of the smb supplied of the calories and daily in detaching the smb supplied of the

tients whom I have cared for recently who are receiving less than 100 grams carbohydrate and I do not think I have seen a pritient this year whose physician had prescribed less than 50 The summer serson and New Lingland colleges bring many diabetics to the neighborhood of Boston Such diabetics if from the west usually have been upon a dict containing 80 grams carbolydrate. With Dr. Sansum's cases the car boly drate rises up to 350 grams Your Dr Geye lin, who has had so much experience with the low fat high carbohydrate diet, will I hope de scribe his own methods in the discussion of this

Perhaps you are interested in my present dietary prescriptions. Lirst of all I try never to overfeed the patient second. I try always to give at least 100 grams of carbohydrate and I hope to give 150 or 160 grams. Many patients find that they feel in better spirits and can work more vigorously with a diet of 100 to 150 grams carbohydrate than with one of 50 grams or less Very occasionally I prescribe still more but I hesitate to reach the 200 gram level because I notice that the patients of others as well as my own in successive years often, though not always require additional insulin-Purthermore I am not convinced that there is any gain for a diabetic to live on more than 150 grams carbohydrate and in turn be obliged to restrict greatly the fat in his food. With such a quantity I should think he would be safe from premature arteriosclerosis We must all strive to treat our patients the best we can and keep and publish our end results for the benefit of others

Insulin has preserved the diabetic and allowed him to live more abundantly, as Di Foster rightly requires, but like any other drug it has its dangers Regretfully I must acknowledge pubhely what others have said to me privately—that the number of deaths due to over dosage with msulm must be considerable. These occur I suspect chiefly because of confusion in the diagnosis of insulin shock from diabetic coma. Two recent man or mesad and so shocking that I util or of the people and urgency for better and die nosis and scientific excitment of three price cover the cost diab

that of medical diagnosis. But this increased cost is economically offset by the reduction of the period of disability through proper therapeusis, and by the obviation of a possible chronicity or morbidity through timely diagnosis.

The mode of present-day living, and the rapacious desire for conveniences, comforts and luxuries, have been great factors in the enhancement of medical cost. Formerly, when a woman expected to become a mother, she arranged the most suitable room in the house to meet the occasion The same simple preparations were made in the case of miscarriages, breast abscesses, simple fractures, hemorrhoids, carbuncles, tonsillectomies and many minor conditions. Today the home, no matter how appropriate, is not a convenient place for the sick, and in most cases a room is engaged in the private pavilion of one of the hospitals or in a sanitarium, as well as the service of special nurses. All these items spell payment, and although the attending physician has no financial interest in these expenditures (if anything, they may jeopardize the surety of his own payment), yet he is debited with this cost. The only criticism that may be registered here against the physician is his failure to discrittage these unnecessary and, to all appears travagant indulgences

Looking at these enormous industry, mercial and medical mergers, one we to the real worth and wisdom of the

giants.

To give even an approximate (economic benefits and commercial ad may accrue from these industrial in a syst premature. But the medical mergers, for their pretentious structures, have an nothing to the intrinsic value of medicine ansurely have not enhanced the standard of its practice. And in the words of Doctor Smith:

"The whole conception of the practice of medicine as it has evolved is bound up in the idea of the individual and personal service of the physician to his patient—a close and confidential re-

lationship.'

Medical service in these institutions is no longer a contribution of the physician who is prompted by a humane sympathy towards the afflicted and suffering; it is just merchandise handed out by a medical automat when the complaint is deposited into the slot-machine of a Medical Center.

Medical service, as it is practiced in these institutions, has no longer the personal in "the the confidential relationship between' patient, but a cold business routine be extension institute and policy holder

Medical charity, as dispensed in toria, is no longer the rendering of by a profession of cooks in detachtion of cooks in detachtion of covery bad. oft, Surgice clinic.

And although the physician is the all-important factor in every medical institution, notwithstanding the big array of paid supervision and salaried social directors, giving his services gratis or for a pittance, yet his identity is lost in the glare of advertised institutional magnatumity, and his contribution of service effaced by the blazing generosity of a benevolent directorate

If these medical "combines" are gradually congealing professional relationship and its psychic bearing on therapeutic beneficence, they are doing even greater harm to the public welfare by undermining the integrity and economic well-being of the physician by the unfair competition made possible by enormous funds at their disposal

"Organized medicine," said a writer some time ago, "is usually hostile to any new project which endeavors to promote an increase in the practice of preventive and curative medicine. Organized medicine is very commonly opposed to any activity which competes with the practice of medicine or tends to reduce the economic cost of disease."

These innuendoes and ignominious insinuations are mendacious, baneful and false and have done much in their pernicionsness to vitate the esteem of the public toward the profession. Most physicians are prompted by a sincere desire to render the best service to humanity, and look on disease public calamity in whose eradication the entitle of the public procession must participate. This is sufficiently in the put by the historical register of those

who gave their lives for the cause who gave their lives for the cause their lives for the cause who paid uplifters and professions, the cauldron of medical being filled with new

llar focus. There is much difference

of opinion in regard to this subject, but I feel rather strongly that retrobulbar neuritis is rarely a focal infection, but usually results from direct extension of the inflammatory process through the thin walls of the ethmoid.

In the foregoing discussion of certain outstanding conditions which cause sudden blindness, I have endeavored to indicate the prognosis as far as the eye and sight are concerned. But is this enough? It must have been apparent that in all but traumatic cases, affections of the eye are usually related to diseased conditions elsewhere in the body, either local or remote.

If we see a retinal hæmorrhage, from our standpoint as ophthalmologists this is serious in so far as it may affect vision, but from our broader viewpoint as men of medicine the hæmorrhage is merely an incident probably portending serious impairment of the circulatory system, which may happily be only transi-

tory or may be of grave omen.

In considering inflammatory reactions of the uveal tract, which are generally regarded as manifestations of focal infection, we are very apt to regard recovery after the cleaning up of some one focal infection as definite evidence that this focus was the sole factor in the local tissue reaction. It may have been, but "post hoc, propter hoc," is a misleading form of reasoning. The normal healthy individual can neutralize a surprising amount of toxin from teeth, tonsils, sinuses, etc., without showing tissue reaction, but a day may finally come when a little extra toxic absorption disturbs this delicate balance and uveitis develops. Prompt removal of a diseased tooth, or tonsillectomy, or exenteration of the sinuses, any one of these, may restore the balance between toxic absorption and tissue resistance. realization of this would discourage much vainglorious boasting of specific cures. case of many eye affections, if they get well in the course of treatment which is not directed at a specific etiological factor, it is because the accompanying systemic derangement or imbalance has returned to normal, probably with the aid of the rest, diet, catharsis, salicylates, mixed treatment, foreign protein injections, etc., which we have prescribed more or less empirically.

### MEDICAL AND SURGICAL ASPECTS OF ACUTE BACTERIAL INFECTIONS

PAPERS PRESENTED DURING THE THIRD GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE, ABSTRACTED BY FREDERICK P REYNOLDS, M D, MEDICAL SECRETARY, COMMITTEE ON MEDICAL EDUCATION

Second Article Ao I is in the Jurnal of December 1st 1ages 1397 1403

#### DR HENRY SAGE DUNNING

HE mouth is the most unclean cavity in the body, the jaw bones become infected oftener than any bones in the body and chronic infections of jaw bones lasting for years have a deleterious effect on nearly all the vital organs," said Dr. Henry Sage Dunning, Professor of Oral Surgery at the Columbia University Dental School, in an address on "Infections of the Mouth"

"Approximately 100 different kinds of bacteria may be found in the average mouth. The dental tissues forming the mouth cavity are injured constantly by hot and cold foods, medicines, illfitting plates, crowns and bridges, broken teeth, hard substances taken in the mouth, in the food, and the wear and tear of mastication

"The mouth is a difficult cavity to keep clean and is an ideal place for micro-organisms to grow and multiply. When bacteria are present and there is mjury of tissue there generally follows inflammation of tissues as the bacteria are given an opportunity to attack and enter the tissues causing an infection. The microorganisms of the mouth may enter the jaw hones directly through an injury of the gum and also through a cavity in a diseased tooth whose pulp of nerve dies and then becomes a pulpless tooth. When the bones of the jaws become infected the bacteria

lodge in the tiny spaces in the spongy bone and it is at times impossible to rid the bone of this infection. The bacteria in the bone have an ideal environment for their growth and reproduction as the blood scrum, moisture, heat and lack of air promote their life activities. The bacteria locked in bone, form toxins and the poison drains into the bone in the direction of the least resistance It is impossible to sterilize the hone or the tissues in the mouth, and consequently the bacteria remain in the bones for years and often for the life of the patient. It depends a great deal upon the chemistry of a person's body and one's resistance to infection whether or not the 'bugs' in one's system become active, crusing disease, or whether they do not

"The concensus of opinion is that it is a rational procedure to eliminate as many bacteria in the body as possible, just as it is now thought wise to reduce the bacterial content in milk and other food taken into the body To this end, modern medicine and dentistry are working to eliminate dangerous bacteria and thereby to prevent disease It is much easier, more economical, more comfortable and less dangerous to keep the mouth clean and the teeth, guins and bones healthy than it is to cure a given disease after it has a 'good start' in a dirty, neglected mouth '

#### DR ISIDORE FRIESNER

Infections of the middle ear play an important role in acute infections affecting other parts of the human system, declared Dr Isidore Friesner, Otologist to the Mt Sinai Hospital, who spoke on "Infections of the Middle Ear" He stated that their treatment is "solely surgical" It consists, broadly, of an attempt to destroy the continuity and obliterate the infected vessel. He stated that there was no evidence indicating that transfusions of any character contribute except indirectly to the establishment of cure

Discussing the pathological changes caused by infections of the middle ear in remote parts of the system Dr Friesner said. "It is interesting to speculate regarding the manner in which the blood stream is relieved of the infectious agent We have seen an instance of severe chill at

night with colonies of streptococci too numerous to count in the blood culture taken at this time and twelve hours later the blood culture be sterile. This phenomenon was repeated three or four times" He stated, on the other hand, that instances of multiplication of bacteria in the blood arising from inflammation of the ear had not come under his observation

The speaker discussed systemic infections arising from the middle ear and affecting the lungs and abdominal organs He added that as far as the symptoms generally are concerned, in such infections they do not differ in their essentials from those of general bacteria infections from other sources. He emphasized the importance of infections of the middle ear in causing acute systemic infections

balance has returned to normal, probably with the aid of the rest, diet, catharsis, salicylates, mixed treatment, foreign protein injections,

etc., which we have prescribed more or less empirically.

often harmful. The microorganisms found in the blood stream are usually the organisms multiply-

ing far from the site of inoculation.

The study of the treatment of anthrax serves as an illustration. Twenty-four years ago the text books of surgery advised excision of the skin lesion of anthrax, followed by the application of caustics, strong antiseptics, or the actual cautery. Small local lesions recovered after this treatment but the results were not as good as when the lesions were protected from injury, the parts kept at rest, and secondary infection avoided. Apparently in some instances the bacilli seem to have been disseminated by the operation. During the last ten years a powerful antianthrax serum has been available and has been used with and without excision. There is a growing recognition that the disease is often local and shut in by a barried of cells; that excision may break through this barrier and disseminate the bacilli and may cut out a focus perhaps furnishing anti-bacterial substances; and that, if the microorganisms are widespread, as is often the case, local excision is useless.

"It is a common observation and one confirmed by experience that mechanical interference, during the early stage of infection should be confined to the simplest measures, such as aspiration and simple incision to afford drainage and thus avoid unfavorable pressure. It is only after the bacteria have disappeared from the circulation and the local focus is well circumscribed, that incision and drainage show satisfactory results. This was well shown in the streptococcus infections that occurred in several of the army camps

during 1918.

"Aside from these pure'y surgical measures which can only be applied in special cases with localized lesions, there are certain general measures in use today, such as bacteriotherapy, serotherapy, chemotherapy and the transfusion of blood. My own experience in these fields is limited and my attitude sceptical. I have seen no such convincing evidence of the efficacy of any measures suggested as to feel justified in advocating it whole-heartedly.

"It is well known that valuable as antiseptic solutions are in preventing secondary infection, in sterilizing the skin, instruments, etc., there are reasons why their use, when bacteria have become established and are multiplying in the body,

is unsatisfactory.

"All these considerations make it improbable that any antiseptic applied with the idea that it

is a simple germicide will be effectual,

"In regard to transfusion of whole blood, there does seem to be a general agreement that it is beneficial, at least temporarily, especially in subacute and chronic cases. Repeated small transfusions seem to be more effective than a single The color improves, the feeling of well being returns, the appetite improves; it seems difficult not to believe that it is helpful in combatting disseminated infection.

#### DR. EUGENE H. POOL

Possible pitfalls encountered by physicians and surgeons in the diagnosis and treatment of appendicitis were discussed by Dr. Eugene H. Pool, attending surgeon at the New York Hospital. He counseled greater care in diagnosis and greater discrimination in resorting to operations.

"Chronic appendicitis, as generally employed, is a misnomer, it rarely if ever occurs. The appendix is not the source of a chronic focal infection, it rarely is responsible for symptoms referable to the gastro-intestinal tract. When there is evidence of a single recent acute or sub-acute attack or repeated suspicious attacks the organ should be removed. Under other conditions one should be extremely cautious as to diagnosis and in general follow conservative measures before considering appendectomy for disturbances of the gastro-intestinal tract.

"Probably the most frequent and serious mistakes occur in children in whom the lesion is often far more advanced than the symptoms and signs suggest. Moreover, in infants and children early pneumonia is often diagnosed as acute appendicitis.

"Influenza often presents at its onset exclu-

~ med sively abdominal signs and sintestinal grippe—and not infreq. `this ieads to the diagnosis of appendiciting cially in children. Anaesthesia and operat ler such conditions greatly add to the dange liscomfort, especially if pneumonia develon

"Undulant fever has in some insa been mistaken for appendicitis and operation performed."

Dr. Pool, discussing the role of the appendix generally in diseases said: "It is beyond question, I think, that the appendix has caused more suffering, sickness and death than any other single structure of the human body. Yet it is so small and apparently so insignificant that its importance was not recognized until relatively recent years.

"When the appendix is acutely infected its peculiar blood supply favors necrotic areas through Its floating and unprotected posiits thin wall. tion in the peritoneal cavity favors spread of infection through that great area. Its generous circulation leads to early and intense reaction of the system to absorbed toxic products. Its structure embodies two tissues which elsewhere are frequently subject to chronic inflammation,

itis, pneumonitis, septicemia and blood

cating elimination of tight abdominal gs, Dr. Bancroft cited the experience of is at the Fifth Avenue Hospital who for ave not used any abdominal dressings and incealed their wounds with court plaster

y have been able to show," he said, "that neidence of evisceration or infection has n greater than when tight dressings are It is our custom to apply sufficient gauze r the incision and to hold it in place with enough adhesive plaster to prevent its

No attempt is made to apply pressure, abdominal binders are used. During the ars this procedure has been followed there n only one case of wound evisceration, as due, I believe, to other causes. The are infinitely more comfortable and their bdominal distension is certainly less. Even with dressings applied at the time of operation one is often sursee an expansion of at least an inch ting the adhesive the first day after the to."

uncroft also stated that "we believe that n is lessened if food is given early." In plicated cases, he said, the patient is and toast the afternoon following the

operation.

reaker said that it must be assumed that

an operative wound is rarely free from the presence of bacteria. Many bacteria in clean wounds are air-borne. The skin isalso a source of bacteria. He stated that "postoperative trauma (or injury) may be as great a cause of infection of clean wounds as the trauma (or injury to tissues or blood vessels) that occurs during the operation." He described methods of reducing postoperative trauma by preventing retching. Different type of sutures for closing wounds were discussed.

"If one studies through the microscope," he said, "the repair of postoperative wounds one is surprised to find the amount of reaction about any foreign body." Every such foreign body, he pointed out, uses up a certain amount of the normal defense reaction of the system against bacteria.

"The adoption of a careful, non-traumatizing technique will do much toward reducing infection in clean abdominal wounds."

He added that blood clots have become relatively more important in surgery as the improvement in technique has diminished many other types of complication. The causes of clots deserve more study, he stated. Coagulation of the patient's blood is an important factor in prevention. Infection or the presence of bacteria or their by-products in the blood stream is a contributing factor in clots, or thrombosis. Study of the blood-clotting factors inherent in the individual patient was recommended. Dr. Bancroft stated that the Mayo Clinic is experimenting with postoperative use of thyroid extract to prevent clots.

## DR. WALTON MARTIN

sing\_the significance and treatment of na, Dr. Walton Martin, Attending Surt. Luke's Hospital, New York, described us phases of dissemination of the infection bacteria are found in the blood nd stressed "the necessity of bringing attitude toward the various measures nthusiastically advocated, often perhaps, triment of the patient." He said that itical attitude should be "found on a of the vagaries of septicemia, or inharacterized by the present of bacteria od."

nation of the contaminated blood gives indication of the complex phenomena e. The number of microbes discovered t a portion of the myriads in the body ly indicate the passage of hundreds of on their way to destruction.

recast of the patient's fate can only y considerating the entire clinical hismection with the blood culture.

not, necessary to be hopeless when

pathogenic germs are found in the blood current. In many patients the germs are poured into blood powerfully bactericidal. In many the germs are found in early stages of disseminated infection, which will pass on to localization and recovery."

Dr. Martin described various experiments on animals showing the course of dissemination of bacteria in the blood and discussed the body's reaction to the invading bacteria and various therapeutic methods to combat the infection.

Dr. Martin said that in most infections there is an initial lesion at the point of implantation indicating a local sensitization of the body and a heightened capacity on the part of the cells to react to the invading parasite.

However, he warned that efforts to deal with the bacteriemia condition at the point of the in-

itial lesion alone were inadequate.

"Attempts have also been made to excise the initial lesion under the impression that the microorganisms are finding their way into the circulation from this primary focus," he explained. "Such treatment is nearly always unsuccessful,

still has too high a mortality in childbirth, European countries are also dissatisfied with their conditions in this respect

Dr Kosmak's subject was "Puerperal Morta'ity and Its Reduction" He introduced the general subject of the program arranged for the
evening by the County Medical Society. The
other speakers were Dr. J. Whitridge Williams,
Obstetrician-in-Cluef, Johns Hopkins Hospital,
Baltimore, and Dr. John Osborn Polak, Profes-

sor of Obstetrics and Gynecology, Long Island

College of Medicine, Brooklyn
"A world-wide interest has been developed in
recent years in the mortality due to childbearing,"
said Dr. Kosmak "The acceptance of a certain
number of maternal deaths as unavoidable risks
which are associated with pregnancy and labor
has been universal for so many years that it was
difficult until a comparatively short time ago to
develop any interest in the subject among the

luty, or even in medical circles

"This point of view has undergone a change and the public has asked and the profession has been asked very bluntly why this should be so, and more particularly we are asked whether anything can be done to prevent this high death rate. For experience has shown that it is definitely possible that a certain proportion of deaths from childbirth can be prevented. In fact, this development in our knowledge has gone so far that we can actually separate the causes of puerperal deaths into those which are preventable and those which are unavoidable.

"In the latter group would come certain un fortunate complications of pregnancy characterized by hemorrhage and similar factors, and in that former larger group we may place toxemia and infection. It is to the infections associated with childbearing that we give special attention in this program and well may this subject be included in the general topic to which the Gradunte l'ortright is devoted. Its importance from a medical as well as a social and economic point of view is stupendous, for puerperal sepsis, that particular complication of pregnancy under discussion takes a toll of over one-third of the mothers who have sacrificed their lives to child-bearing.

'It would seem that sepsis could be prevented in obstetric practice as it is elsewhere in medicine As a matter of fact it his to a large degree, but as we are still ignorant of all the modes by which it develops, the milleunium is not at hand in so far as its complete abolition is concerned. But we must continue our efforts to attack the problem, even if this requires a revision of the me ins by which we have thus far studied it.

"It appears to me that the methods of prevention generally employed are too much limited to local conditions and not sufficiently extended to the patient and her organism as a whole We

have directed our attention largely to the maintenance of an asentic labor, realizing fully however that even where this is properly conducted there are numerous avenues of infection which cannot be completely controlled. In this we have side-tracked as it were the muntenance of the natural resisting powers of the patient and it might be well, although this seems far-reaching. to regard with careful thought the lessons of immunization which have been taught by the pediatrist, the internist and others. This is a field which has been largely neglected, for we have been so busy with our local efforts of preventing the introduction of organisms into the body that we have forgotten how great a factor the natural immunity of the woman is under such circum stances. Were it not for this immunity a much larger number of women would succumb we are gradually finding out that the pregnant woman develops a preventive organism in her pelvis and in her blood-stream, the maintenance of which we must aim to develop and to make use of in our fight against puerperal sepsis

"This, I believe, to be one of the leading factors in future efforts to reduce septic infection as the result of childbearing. In the meanwhile it is important that we persist in our use of the knowledge already at hand and that every effort he made to avoid the introduction into the gencrative tract of any pyogenic organisms which may later possibly invide the tissues themselves As a matter of practice this should be the prin cipal aim because here we are treading on more or less known ground, for it has been amply proven that a delivery conducted under natural and clearly circumstances is less apt to spell disaster from the standpoint of infection than one which is carelessly or ignorantly carried out A tendency to interfere with the natural course of labor by various operative and other procedures is undoubtedly one of the most serious accusations which the profession will have to face It will be difficult to curb this tendency, for on the one hand, there is the demand by the patient for a shortening of her labor, stimulated as it has been by widely circulated magazine articles and other propaganda, to which desire for relief the physician is only too ready to accede perhaps for reasons of his own And then on the other hand, is that increase in technical knowl edge about obstetric deliveries which is so valuable in the hands of the highly trained specialist and so dangerous if practised by his less competent collergue

'And how may the unfortunite result of these circumstances be combated? I believe very firmly that it is only by the proper education of our medical students, by gruing them a well balanced general education in medicine, rather than a smat terms of the various specialties, so that they will provide a thorough knowledge of the physiologic and

of a characteristic empyema. Every year the war a few of these cases have also been The wide-spread occurrence of these cases demic form and the spontaneous cessation epidemic, constitute phenomena among the triking in modern medical history.

e typical pneumococcus cases give rise to loubt and one can never be absolutely sure individual case whether he is not in reality; with a case of true lobar pneumonia. The number of such cases, however, in my ence is small, only about two per cent of es of pneumonia. These cases have not neluded among the cases of true lobar onia because of the typical onset, the mild and the irregular distribution of the lesion ung with evidence of wide-spread involve
[ the bronchi. The mortality among these as been low, 7.5 per cent, and the pneuconcerned have in almost all cases been forup IV.

e will not permit nor do I propose to to recount all the progress that has been uring the past twenty years in the eno understand the nature of the phenom-

infection and recovery in the best rized form of pulmonary infection, obar pneumonia of Type I and II. Difof opinion undoubtedly exists as to the mificance of all the observations made 
instances, and their practical applicaproceeded very slowly. But, as you all 
en in industry it takes time for new 
new methods to be made applicable to 
e of man on a large scale. General emof the airplane has not immediately 
the demonstration of the possibility of 
any advances in knowledge concerning 
technical procedures must wait long be-

of specific or serum therapy, progress has also not been entirely lacking. While the administration of oxygen in pneumonia is an old remedy, its theoretic foundations were seriously questioned and its efficacy greatly doubted until very recent years. It was only through the construction of chambers in which the oxygen content of the air could be carefully regulated, and in which patients suffering from pneumonia could be treated, that the amount of oxygen they received could be accurately determined and its effect observed. It has now been demonstrated that when patients suffering from cyanosis, and therefore with deficient oxygen content of their hemoglobin, are placed in an atmosphere rich in oxygen this cyanosis diminishes or disappears, the color of the skin becomes normal, and the blood, when tested, is found to have increased its oxygen content. In many cases this change is accompanied by subjective improvement and even apparently by real relief to the circulatory and respiratory apparatus. That the relief of this burden of anoxemia in a patient, otherwise seriously intoxicated, is of real benefit seems obvious on theoretical grounds alone. Whether, however, the severity of the infection, which after all, is probably what most matters, is thereby changed to any appreciable extent, only a much wider experience will show.

"It can hardly be maintained that drug therapy in this disease has shown any outstanding advances in recent years. Experimental and clinical studies, however, have more clearly revealed the effects of certain drugs in pulmonary infections, and have indicated the harmful effects of particular drugs under certain conditions, drugs which were formerly widely, and frequently indiscriminately, employed. For instance, the usefulness of morphine in most cases has been experimentally and clinically demonstrated, but on the other hand, its harmfulness in certain cases with mide-spread exudation into the lung has

Volume 30 Number 24 1479

# NEWSPAPER PSYCHIATRY—THE PSYCHOPATHOLOGIES OF EVERYDAY LIFE By LOUIS J. BRAGMAN, M.D., SYRACUSE, N. Y.

T is interesting to analyze, from a psychiatric point of view, some of the so-called startling occurrences that are daily chronicled in the headlines of our newspapers. It is possible, reasoning from analogy and making due allowances for the distortions, inaccuracies, and inadequacies as to pertinent facts apparent in the news accounts, to unravel many of these complicated happenings in the drab light of hundreds of similar cases encountered in the doctor's private practice, in clinics, and in hospitals. Every physician with psychiatric experience can easily duplicate from his own office files almost any of the types of hizarre, sensational behavior that provide grist for the newspaper mill.

Dr. George Zeller, Director of the Peoria, (Illinois) State Hospital, recently selected nine patients with whom he had close professional contact and wrote them up under the title The Bereft.\* The table of contents of this book would brighten the day of any "copy" editor, including as it does the story of Fainting Fanny, one of the most celebrated institutional characters this country ever produced, who could escape the legal consequences of her depredations by the simple expedient of feigning illness, which she developed into a fine art; the tale of The Graveyard Elm, which deals with a well-known aberrant type of mind that takes a morbid delight in desecrating graves, and other interesting cases, which in the daily press would bring shudders of amazement and horror, but which repeat themselves with monotonous frequency in all large insti-tutions for the mentally afflicted. Even the novelist with his fertile imagination does not begin to apprehend the richness of the material afforded by the neurotic or the psychotic individual whose behavior to the editor would be "news." but to the physician is routine "clinical material." Truth is indeed stranger than fiction. A glance at some newspaper types, picked at random, will bear this out:

"Boston's Entirely Unofficial Spokesman" is the caption of the rotogravure picture of a man, eccentric by his very appearance, who was the subject of a prominent news item recently. In brief, the story relates that this man, a janitor, sent out invitations to hundreds of cities to attend a meeting of the "World League of Cities." No special insight into this man's life is needed to appreciate that we are here dealing with one of the many variations of the unstable mind that presents itself to the psychiatrist in his day's work. Whether this

person has the static pupils and inactive knee jerks that suggest the grandiose ideas of a paretic, or whether he represents a type of dementia-præcox psychosis, cannot be determined except through personal examination, but enough is manifest on the surface to indicate that his mind is running in an abnormal channel.

There is the case of the freak featured under the heading "Fiddle-Maker Eighth Time Offers To Be President." Such persistency is without question "queer." The write-up says: "Alvin Washington Van Dorsten, a violin maker, today announced himself a candidate for the eighth time for the Presidency of the U. S. His announcement submits his name to both the Democratic and Republican parties." The noble ambitton here manifested is something for the casual reader to smile at quietly and pass over, but who can doubt the day-dreams, the pleasant phantasies, the blighted hopes, that pervade the mind of this unfortunate would-be-president and form the background of this "clinical picture"?

In psychiatric terms, we are dealing here with the "paranoic" mind, a "paranoic" being a person who has built up a system of delusions, who is abnormally suspicious of others, and often suffers from an unreasoning fear of being harmed by those around him. This condition, coupled with the normal defense mechanism, frequently makes the paranoic a dangerous person. There are two general types of paranoia, though at times they are not clearly distinguishable, the one associated with dementia præcox and the other a pure type. In the first, owing to the accompanying mental deterioration, the bizarre ideas are often recognized and properly interpreted before any harm is done. Frequently, this type is included in the membership of the various cults, religious, social, and otherwise, that are written up in great length in the papers one day and forgotten the next. But it is the second type, the true paranoic, whose system of ideas, unaccompanied by any mental breakdown, is of such seemingly logical quality, that he becomes a potential social menace. In this class we find the so-called public nuisances. many cases of malicious conduct, "poison-pen' letters, litigations, assaults, and homicides.

The scientific paranoic is always on the front page. Here is another specimen, typical 1 cause, with no mathematical skill or training with no intellectual assets, he is bent on setting existing systems, on revising plophies of life, and otherwise transformation.

# PRACTICAL CONCLUSIONS DRAWN FROM ONE THOUSAND FORCEPS DELIVERIES

#### By H. J. STANDER, M D, BALTIMORE, MD

Abstract of Paper real before the Medical Society of the State of New York at Rochester N J June 3 1930. For complete orticle, see Johns Hopkins Hospital Bulletin. December 1930.

**7HE** two most important problems in Obstetries in this country are the appalling maternal mortality and the high death rate in the new-born We, as obstetricians, cannot be proud of the former, nor can we clum to have materially reduced foetal mortality during the past generation, except by the prenatal treatment of syphilis and perhaps by the more frequent employment of Clesarian section in patients with contracted pelves. It is only by an honest acknowledgment and careful study of our bad results, rather than by directing attention to our occasional satisfactory successes, that we shall be able to raise the standard of obstetrical practice and thus reduce these death rates

This paper is based upon the analysis of one thousand consecutive forceps deliveries performed in the Obstetrical Department of the Johns Hopkins Hospital from October 17, 1917 to December 31, 1929—a period of slightly over twelve years. It shows that in 15,370 full term deliveries, the incidence of forceps delivery was

about 9 per cent, or 1 in 11

The following conclusions are drawn

1 Low forceps constitutes over 80 per cent of all forceps delivery, while high forceps was performed in less than 2 per cent of the cases

2 Uterine mertia or prolonged second stage of labor accounts for over half the forceps operations

3 Forceps delivery is necessary four times more frequently in primiparous than in the mul

tiparous patients

4 Contracted pelvis occurs more than twice as frequently in the colored as in the white patient. It is a considerable factor in the indication for forceps, since it not only includes contraction of the pelvic outlet due to funnel pelvis, but also plays a considerable part in the production of uterine mertia, in patients who are subjected to a test of labor.

5 The gross foetal mortality incident to for-

ceps delivery is 10 per cent

6 The foetal mortality in colored primiparae is 17.4 per cent, and constitutes the most important single factor in the production of the high gross mortality in forceps delivery

7 The focial death rate is definitely increased by failure of rotation in posterior presentations and is particularly high where the head is ar

rested in deep transverse

8 The duration of labor is a very important factor in increasing the foetal mortality incident to forceps delivery. After 48 hours the foetal death rate becomes excessively high

9 Only one fifth of patients delivered by forceps had no perineal lactrations. As tears are far more frequent in primiparae, primiparaty may be an argument in favor of routine episiotomy.

10 Our experience shows that the colored woman is about twice as poor a risk as to both morbidity and mortality, as the white prigent

11 The cephalic application of the blades is essential to the proper performance of forceps delivery. The high incidence of obliquely posterior and of deep transverse presentations makes it inadvisable to apply the blades to the sides of the pelvis, and it is to neglect of this precaution that the great dread of such presentations is due

12 The foctal heart in utero does not always afford satisfactory information as to the condition of the child, and this should be borne in mind especially when forceps are applied in women who have been in labor for more than

36 hours

13 The foetal mortality is higher in primiparae than multiparae, and this is particularly true for forceps delivery in the young primipara under 20, as well as in the elderly primipara over

35 years of age

14 From the considerations here adduced, it is apparent that the conservative use of the forceps is a means of saving the lives of many infants, but nevertheless, the foetal mortality is higher than is usually appreciated

# PRESIDENTIAL COMMENTS ON CURRENT EVENTS-No. 12

eaking at a great many medical society this year I have received in return an unding of the medical attitude and common the public attitude toward certain relationships that I would not have unfrom any other experience that I have the State there is an aroused inter-

tions. It has appealed definitely r cent of the medical profession hily physicians and who do about of all the medical work. To aily physician, who knows the ing, and sympathetic relationship that between doctor and patient, will do develop a spirit of public medical ny activity of organized medicine

cent annual conference of the Secredents, and Editors of the Constituent al Societies, there was more attention dical relations than usual. There was recognition of the fact that there is the practice of medicine than just to se.

that the profession will go along with e thought that a doctor has a dual. The major one is the private practice ie, the intimate relation of doctor and st as it always has been. This is the f scientific medicine. We have just cience as we can make use of. Scienme is on a high plane. The other part r's responsibility is essentially civic. It gation to take part in public medicald help to discharge the public social f medicine that once was greater than and to which we must come back if ng to hold the full measure of public

retaries' Conference discussed "Service idigent Through Contract with the edical Societies" and "Methods of Radio Valuable in Spreading Health a." There was considerable discusto "Health Insurance" as it exists wenty-three countries of the world. example of cooperation between the fession, public health and educational is was related. The work that New has done through its Public Relations in bringing about cooperation between ations having anything to do with welfare and the medical profession in entire conference.

rence is plain enough that the proeginning to take a different attitude ities of other organizations, trying high to meet certain unsolved health iefly arising from an awakened public ousness and due to the revelations of

medical research. These resources have not yet been made fully available to the public, and their lack of availability constitutes one of the major problems confronting the medical profession.

The medical profession has for some time blamed health organizations and the State for their public health activities, on the ground that it interfered with the private practice of medicine and that it was wrong to do anything that might interfere with the reputation of the practitioner. This attitude of mind is changing now to the need of guiding and directing health activities of other agencies, realizing more than ever before that there are changing social conditions and that the activity of other agencies is solely because the medical profession has not been able to publicly distribute the benefits of the resources that its own science has developed for the prevention and limitation of disease.

There is a growing impression in organized medicine that we are talking rather too much and too publicly about economic conditions and creating economic committees and economic bureaus as our sole effort to correct the troubles. Everything is suffering economically today.

The attention that the profession gives to the discussion of the indication of social trends in health demands is one of the most interesting indications of changing times. All that organized medicine can do is to adopt certain policies that will give to the public the health servce that it needs; to take a civic interest in the efforts of organizations to solve health service problems, and to give to the work of other organizations expert aid and guidance and render the technical medical service that it is trained to give.

The interest shown at this conference, without doubt, indicated that organized medicine realizes that it must meet certain conditions that are world-wide that have been met by most of the countries of the world by health insurance and have not yet been met in America because they have not pressed so hard for solution. Organized medicine has not seemed to have, until recently, a conception of the danger that confronts it and this conference brought out the fact that it was about time for medicine to begin to work out an American system for medical service if it is going to escape the restrictions and limitations that have been placed upon it in many other countries of the world.

The National Secretaries' Conference this year must have appealed to the good judgment of those who attended because everyone who spoke of the program said, "This is the best program and the best meeting that I have known."

If the profession of medicine has a clear conception that real public problems confront it, then it will come nearer to solving these problems than if it continues to feel that it is already fulfilling

Specific for Pernicious Anemia

# VENTRICULIN

This new Anti-anemic Substance is now obtainable from the nearest Parke, Davis & Company branch or depot through your regular source of supply.

Researches collaborated in by Dr. E. A. Sharp of our Department of Experimental Medicine and Drs. C. C. Sturgis and Raphael Isaacs of the University of Michigan have resulted in the development of a stomach extract which presents certain definite advantages over liver extract in the treatment of pernicious anemia.

- 1. More palatable.
- 2. More effective in stimulating reticulocytosis.
- 3. Better adapted to prolonged treatment.
- 4. More stable.
- 5. Cost to patient greatly reduced.

The name of this new product is Ventriculin (from the Latin ventriculus, stomach). Ventriculin is marketed with the collaboration of the Thomas Henry Simpson Memorial Institute for Medical Research of the University of Michigan. Every manufactured lot of Ventriculin is tested by the University of Michigan and approved by the Director of the Simpson Memorial Institute before it is distributed commercially.

Samples, for the present, are not available.

RADON IMPLANTS

Radium therapists will instantly recognize the advantages of this new Gold Radon Implant\*.

No longer need there be uncertainty as to the loss of radon through leakage. The new Gold Radon Implant is hermetically sealed. Certified concentration is now assured.

The serious objection to the irritating effect of sharp and ragged edged implants is now completely overcome. With perfectly hemispherical ends, highly polished, the new Cold Radon Implant can be passed through the implanting instrument without difficulty, and will not cause irritation to implanted and will not cause irritation to implanted

Every implant is uniform in dimensions, and has these physical characteristics: outside diameter 0.9 millimeter; length 4 millimeters wall thickness 0.3 millimeter instead of the usual 0.2 millimeter. All implants are made from 24 karat gold. Absorption of Beta rays 97.6% as against gold. To 0.2 millimeter gold formerly used.

We furnish the new Gold Radon Implant in two types—permanent or removable. Removable implants can be withdrawn from tissue immediately treatment is concluded.

You may enjoy these added advantages at no increase in price.

Implanting instruments will be loaned without charge.

Quick deliveries to all parts of the United States or Canada.

Wire, write or telephone your orders.

its entire function by developing and practicing scientific medicine, applied only to disease and mits from its activities the expert guidance of iffort to increase the availability of resources o prevent disease.

The impression that I brought away from the recent Secretaries' Conference was that while not all who attended had thought much along the lines of the second obligation of medicine, that of giving civic service, they were all in a receptive

mood for the consideration of whether organized medicine is functioning today in line with public needs which are so different from even a few years ago; and which every nation in the world is thinking about. Nothing is surer, I believe, than that government everywhere realizes its responsibility for the health of its people, and if they do not get it adequately, will take a hand in its provision.

WILLIAM H. Ross.

#### DR. WILLIAM BENHAM SNOW

The medical career of Dr. William Benham now, who died on November 29, 1930, aged sevnty years, is an example of great accomplishments in the face of difficulties. The son of a farmer in Greene County, he was attacked with muscular atrophy at the age of sixteen years. His affliction led him into the field of neurology, and later into physical therapy. He also was one of the early workers with the x-ray, exposure to which was probably the cause of his death.

Dr. Snow was one of the fathers in the movement to add physical therapy to other therapeutic measures. He was widely known both in Greene County, where he began his practice, along the valley of the Hudson River, and in New York City, where he passed the greater part of his active life. He was eminently successful as a practitioner, editor, author and teacher, and was loved by all his colleagues and pupils and by his patients and companions.

Patent Medicines and Nostrums: This Journal of December 19 contains an editorial by Dr. E. Eliot Harris ling attention to the distinction between propr. arry medicines, patent medicines, nostrums, and secret synthetics. He also protested against the use of the word "patent" as a synonym of nostrum, and of "patented" as its antonym, thereby introducing an element of confusion of thought. Dr. Harris sums up the editorial as follows:

"1. Proprietary remedies include ethical preparations and nostrums.

"2. All medicines protected by a patent are ethical.

"3. Nostrums include secret proprietary mixtures and secret synthetics protected by the trademark law.

"All samples of secret medicines should be deposited in the trash-basket, as every scientific physician should know the quantity of the ingredients in the mixture or mixtures which he uses, and should beware of secret synthetics."

Doctors today will do well to hold these distinctions in mind.

its entire function by developing and practicing scientific medicine, applied only to disease and omits from its activities the expert guidance of effort to increase the availability of resources to prevent disease.

## MEDICAL PROGRESS

The Clinical Significance of Tubercle Bacillemia.—E. Löwenstein says that the tubercle bacilli enter the blood stream with extraordinary frequency, without our having as yet any clinical symptom by which to diagnosticate bacillemia. He succeeded in showing that two hours after their intracutaneous injection into the terminal phalanx of the hindfoot of the guineapig even the removal of the entire foot could not protect the animal from a generalized tuberculosis. This shows that the bacillus is carried not only by the lymphatics but also by the blood stream. It is easy to obtain pure cultures from the blood by Löwenstein's method of adding 15 per cent sulphuric acid to the culture medium, which destroys all other kinds of bacteria. His improved culture medium consists of eggs, asparagin, and congo red. Frequently the bacilli are present in such numbers that every individual drop of blood yields a colony. They are found in large numbers in the blood of tuberculous patients without fever, whether the disease is localized in the lungs, kidneys, skin, joints, or elsewhere. Recently in two cases of undiagnosed dermatosis the finding of tubercle bacilli in the blood in great numbers made diagnosis possible. Löwenstein's investigations show that after the appearance of an isolated focus the bacilli circulate in the blood and cause a chronic bacillemia, which may persist after the particular focus is fully healed. In collaboration with Reitter he has recently demonstrated their presence in the blood of 21 patients (100 per cent) with typical acute "rheumatic" polyarthritis, thus confirming Reitter's view of the tuberculous etiology of acute joint rheumatism. Pure cultures have thus far been obtained in 48 cases of the latter. Under the improved method three of every four cases of clinical tuberculosis of the eye examined gave pure cultures. Thus far 159 different strains have been identified in the circulating blood, with wide morphological and cultural differences. On account of the dependability of the method it seems likely that this direct demonstration of the disease virus in the circulating blood may possess a greater signisicance for clinical medicine than the tuberculin reaction.—Münchener medizinische Wochenschrift, September 26, 1930.

Unapparent Dystrophies.—The clinical and experimental study of deficiency diseases. says Georges Mouriquand, in the Bulletin de l'-Académie de Médecine, of October 14, 1930, has demonstrated that side by side with diseases that are characterized by the classic signs (including the avitaminoses A, B, C, and D) there

exists every grade of predeficiency. It may be recalled in connection with rickets (avitaminosis B) that loss of calcium and phosphorus begins many months before any bony changes appear even in the roentgenogram. Similarly, ocular signs of vitamin A deficiency do not appear in noticeable degree until this has been experienced for forty to sixty days. A diet partly deficient in vitamin C but otherwise balanced may keep the body for a long time in a condition of predeficiency which may easily turn into a state of true deficiency if multiple lacks in diet exist. It is possible to conceive of an absolutely latent deficiency which may be described by the author's epithet "unapparent." Here dystrophy exists but gives no sign, even minimal, of its presence. When guinea-pigs were placed on a regimen deficient in vitamin C but containing sufficient calories. typical scurvy developed in 12 to 15 days. Un the same deficiency diet with calories reduced by two-thirds, however, no scurvy developed, and the animals died without showing signs of dystrophy even at autopsy. To bring the scurvy out into visible appearance, the diet must be strongly scorbutigenic, with a wide disparity between total vitamin C and total When the disparity is slight becalories. tween these factors, the scurvy remains unapparent, but nevertheless existent. In addition, such other factors as increase of basal metabolism, presence of infections and the like, may bring to light a scorbutic dystrophy previously invisible. The same is true of other deficiencies, though perhaps not so readily demonstrable. The infant fed on cow's milk is frequently suffering with an unapparent dystrophy which may remain unrecognized thanks to otherwise careful hygiene. This unapparent dystrophy is revealed only too often by the child's lessened resistance to infectious diseases or by serious digestive disturbances which may end in fatal athrepsia.

Automassage of the Vessels in Bed-Patients.—A. Böttner says in the Deutsche medizinische Wochenschrift of October 31, 1930, that by a modified use of the so-called Franke system of vessel gymnastics it is possible to preserve the elasticity of the vessels and of the body as a whole during a prolonged stay in bed. The method is applicable even for patients who are seriously ill, with or without fever, and prepares these persons in advance for the time when they will be able to leave

the bed and assume an upright position It consists essentially of the repeated artificial emptying and filling of the blood vessels by holding the arms and the legs alternately in a vertical position. Unlike ordinary massage which makes pressure from without inward, the Franke method exercises a stretching or contracting effect on the vessels from within outward. Hence the massaging effect is produced under conditions that make a strong de mand on the vessel elasticity, by means of the blood masses themselves For patients on whom the lifting of the legs into a vertical position would make too strenuous a demand, a slanting board, on the principle of a bedrest, has been provided with curves specially adapted to support the knees and ankles comfortably at any desired angle. The arms and legs are held up alternately for 7 or 8 minutes The procedure is carried out 4 or 5 times in succession, and is repeated 3 times a day. In some cases the nurse may offer a little assistance when the patient is too weak to manage the lift-The method is especially indicated for patients with diseases of the extremities, such as osteomyelitis joint affections and the like, but it is advocated for every class of patients who must suffer an enforced stay in bed. It is un surpassed as a means of preventing thromboses and resultant embolisms, especially in cases where toxinfectious factors tend to produce blood changes or affections of the vessel walls "Decerebrate Rigidity" in Man - J S Man son and Gergus R Terguson, writing in the British Medical Journal, November 8 1930, 11,

3614, report an interesting case which appears to represent the counterpart of experimentally produced decerebrate rigidity. The patient, a man aged 67 years, came under observation in 1918, ten years before his death, complaining of stiffness and pain in his left shoulder At that time he inclined to the right when He complained of stiffness in the left shoulder and pain in the left leg His condition gradually became worse, so that he became bedridden and developed dementia During the greater part of ten years he lay motionless and speechless, with his arms adducted and flexed at the elbows and wrists, and his legs rigidly extended—in the position regarded as the physiological counterpart of experimen tal decerebrate rigidity. At the post-mortem the dura mater was found to be thickened and excessively vascular in the right pre-Rolandic area, it covered and was adherent to a firm rounded tumor about two inches in diameter, which appeared to have hollowed out the brain tissue by pressure The tumor had the appearance of an endothelioma, growing from the fals cerebri Beneath the tumor there

was a softening extending into the basal gang-On the left side there was no obvious softening and the cerebral artery was not oc-Microscopical examination confirmed the endotheliomatous nature of the tumor, and showed some degeneration in the pyramidal tracts in the midbrain and pons, but not in the medulla oblongata. The early, rapidly progressive dementia and other unusual features in this case make it probable that a consider able portion of the symptomatology was due to cerebral vascular disturbances. After dis cussing the divergent views as to what constitutes clinical decerebrate rigidity, and why cases present such differences in the posture assumed, the conclusion is reached that the resulting picture depends on the degree to which the cortico spinal and strio spinal systems are affected and their relative importance in a particular subject, animal or human writers express the hope that this case report will stimulate interest in these questions, and will lead to more complete examinations which in turn will help to solve the problems of the motor pathways and the lesions which result from diseases affecting them

The Value of Alkalis in the Treatment of Chronic Nephritis -A Arnold Osman, writing in The Lancet, November 1, 1930, ccxix, 5592, summarizes the results of the treatment of certain types of nephritis with alkalis dur ing the past seven years. Amounts of alkali varying from 200 to 700 grains daily were taken by some of the patients for as long as four years In 40 cases so treated the mortality was 37 per cent, while in 40 similar cases treated by other methods the mortality was 42 per cent The chief value of the alkalis in the treatment of nephritis consists in their action in promoting diuresis and thus ridding the tissues of excess water or edema. It has been found that if equal parts of potassium citrate and sodium bicarbonate are given by mouth, in amounts sufficient to raise the plas ma bicarbonate to, and to maintain it at, a normal level under all circumstances of diet and exercise, it is often possible to induce a diuresis sufficient in degree and duration to rid the body entirely of edema. If, after the edema has subsided, the dose is readjusted to that which will, under the new conditions, maintain the plasma bicarbonate at a normal level, the edema often does not return. Under the influence of alkalis, albuminuria is almost always reduced and may disappear entirely During the treatment with alkalis no dietary restrictions need be enforced. The treatment should, except in rare instances, be used only where a preliminary estimation has shown a decrease in the plasma bicarbonate. It may

be used in chronic parenchymatous nephritis, chronic "mixed" nephritis, the late stages of acute parenchymatous nephritis and of subacute nephritis, with persistent edema and without marked hematuria. Alkalis should Alkalis should not be used, with rare exceptions, in the early stages of acute nephritis with hematuria, in acute diffuse nephritis, during acute exacerbations (with hematuria) of chronic nephritis (unless controlled by estimations of blood bicarbonate), or in the presence of marked myocardial degeneration and cardiac arrhythmia. When there is persistent vomiting or marked dyspnea, alkali therapy should not be used without a preliminary estimation of the blood bicarbonate, nor should it be attempted in cases of persistent edema until other and simpler measures have failed.

Bacterial Hypersensitivity of the Intestinal Tract.—Stanley E. Dorst and Roger S. Morris call attention to a type of disease which presents a clinical picture varying within wide limits and frequently diagnosed as chronic appendicitis, peptic ulcer, chronic cholecystitis, spastic colitis, or mucous colitis. They thought at first that some unusual organism in the enteric flora might be the responsible agent, but investigation revealed only normal flora. A series of 30 patients who had symptoms of long standing, were skin tested with various normal strains of enteric bacilli. The results were most astonishing; 26 of the 30 patients showed marked sensitivity to one or more of the "normal strains." An attempt was made to desensitize patients sensitive to active strains, by giving exceedingly small doses daily, keeping within the dose producing local or focal reaction. The usual result was a gradual disappearance of skin sensitivity, paralleled by a disappearance of clinical symptoms. The fact that one of the authors obtained rather favorable results in a group of similar cases by the use of repeated doses of castor oil, led to the study of the detoxicating action of sodium ricinoleate. It was found that sodium ricinoleate detoxifies many organisms in the enteric flora in vitro, as demonstrated by the disappearance of skin reactions upon the injection of strains which before detoxication have given marked reac-Further observations proved the value of administering sodium ricinoleate orally, together with possible autovaccination. Five rrains of sodium ricinoleate are suspended in slive oil, enclosed in a soft enteric capsule and ne is given before each meal and at bedtime; radually the dose is decreased as symptoms abside. Patients who have been given this nd no other treatment gradually lose their in sensivity to organisms to which they had

shown previous sensitization.—American Journal of the Medical Sciences, November, 1930, clxxx, No. 5.

The Diagnosis and Treatment of Some Common Minor Digestive Disorders.-T. C. Hunt, in discussing certain common digestive disturbances which tend to be neglected in the text-books, says the typical bilious attack is just an attack of migraine. There is an abdominal type of migraine which may occur as a true constitutional disorder or in association with gallbladder disease. Differentiation may be difficult, and even if the gallbladder is diseased its removal may not relieve the attacks. The underlying cause in both cases is often a metabolic liver disturbance, which may be treated successfully by the administration of 1 or 2 ounces of glucose three times a day, and one of the preparations of bile salts, with moderation in diet, and sometimes by duodenal drainage of the bile. Functional dyspepsia in young people is of two types, one in which nervousness gives rise to indigestion and the other in which indigestion gives rise to ner-The differentiation of these types depends upon whether the nervousness precedes or follows the indigestion. In young girls there is a type of nervous dyspepsia associated with marked thinness, amenorrhea, constipation, and visceroptosis. In its treatment the fundamental thing is to produce a gain in weight. In such cases the administration of 5 grains of insulin, increased to 10 grains, twice a day gives the most striking and satisfactory results. The insulin is given with a plentiful supply of barley sugar or glucose, and is continued for three weeks. insulin provokes gastric, pancreatic, and biliary secretion and lessens spasm; it is perhaps the best tonic we have. The patient must be convinced that her constipation is a relatively harmless condition and all drastic purgatives must be abandoned. In true neurasthenicdyspepsia change is the most important fac-The dyspepsia must be treated in new surroundings and with new thoughts. In old men enlarged prostate may be the cause of dyspepsia; the treatment is essentially surgical. Arteriosclerosis may also be a cause of dyspepsia in the elderly, due to actual vascular changes in the gastric and mesenteric vessels and the abdominal aorta. For this type of dyspepsia Abernethy's advice is applicable: Allow six hours between meals, eat slowly, rest after meals, dine off of one dish.—The Lancet, November 8, 1930, ccxix, 5593.

The Present Status of Peptic Ulcer.—Sara M. Jordan states that as a result of Ivy's investigations we have come to believe that

chronic peptic ulcer is produced by repeated spastic contraction in the storrich, which in turn, is associated with high secretion of hydrochloric acid, both of which may be caused by increased nervous tension. This conception immediately suggests as the appropriate form of therapy measures which favor relavation of the spastic condition and neutralization of the strong acid. In the writer's experience in over 900 cases the neutralization of acid combined with rest, as elaborated by Sippy, has been most successful. Hospital rest is prefcrable for several reasons. It permits checking up of the hydrochloric acid to avoid alkalization as well as madequite neutralization, checking up the stools for occult blood and the subsidence of symptoms controlled by fluoro scopic examinations. It provides an opportunity to educate the patient regarding the nature of peptic ulcer and the necessity of following the regimen outlined. A carefully eval unted history, together with an analysis of the chemical and roentgenological data are the three basic constituents for the diagnosis of ulter With our increasing knowledge of gallbladder and colon disorders, a history of peri odic distress occurring at certain times after meals with food and soda relief, can no longer be considered as positively diagnostic most helpful part of a history is an accurate description of a typical day with distress, including a list of the food eaten at each meal and an exact record of the time of occurrence ind character of the distress, with the exact effect of all measures, such as rest, food al kalıs or bowel movement. The criteria upon which the decision of curability is based are (1) the disappearance of the r ray defect, (2) the subsidence of symptoms, (3) the complete disappearance of occult blood from the stools It is generally agreed today that medical treatment should be tried before surgery is contemplated The commonest errors in the treatment are the use of too little food, or too little variety in the food, for the ambulatory patient, the use of too much magnesia and of larger doses of alkalis than are necessary, and failure to forbid the use of alcohol and nico The theory generally held a few years ago, that pyloric obstruction with twenty-four to forty eight hours retention of barium should be relieved by surgery has been abandoned Many of these patients are now being relieved by medical management -New England Jour nal of Medicine, November 6, 1930 xcciii, 19

The Spleen as an Organ of Internal Secretion - G P Sakharoff, writing in the Revue française d Ludocrinologie of August. 1930, points out two reasons why the spleen should be regarded as an endocrine organ. first, because it produces a special substanceleucocytolysine-which dissolves the white cells of the blood, and secondly, because of the influence exerted by the spleen upon heredity This substance entering the blood stream, has an influence upon all parts of the circulatory apparatus thus regulating in a great measure the morphologic composition of the blood, es pecially as regards leucocytes. In the leu cocytolytic function we see the regulation of at least one special substance poured directly into the blood and producing an effect throughout the entire circulatory system Findings of another character also suggest that the spleen is related to other organs of internal secretion Thus Sakharoff has found in splenectomized mice a number of corpora lutea in excess of the animals in the litter. This agrees with the findings of certain Serbian workers in respect to the early rut of splenectomized mice due to absence of the restraining action of the splcen upon the ovaries, expressed here in the early maturation of the follicles and their rupture in a number greater than normal. An increase in the number of offspring in the litter of splenectomized mice has also been noted. In the second generation such offspring present a stable leucopenia which is maintained through subsequent generations showing no tendency to return to normal The influence of splenec tomy is also observed in the transmission of the color of the fur, which tends to pass into grey In the crossing of normal white females with yellow males a certain number of grey or white specimens are obtained But in the crossing of the same males with splenectom ized females the number of grey specimens increases in proportion to the time elapsed from the moment of splenectomy, and since the color of the fur is determined by heredity the question of the influence exerted upon the chromosomes naturally arises. The crossing of splenectomized grey or yellow males with normal albino females produces in the fur of the progeny a displacement toward white We are therefore led to the conclusion that splen ectomy causes nutritive changes that act upon the extoplasm of the genital cells, producing modifications which are reflected in the hered ity by clearly characterized displacements

be used in chronic parenchymatous nephritis, chronic "mixed" nephritis, the late stages of acute parenchymatous nephritis and of subacute nephritis, with persistent edema and without marked hematuria. The Present Status of Peptic Ulcer.—Sara M. Jordan states that as a result of Ivy's investigations we have come to believe that

chronic peptic ulcer is produced by repeated spastic contraction in the stomach, which in turn, is associated with high secretion of hydrochloric acid, both of which may be caused by increased nervous tension. This conception immediately suggests as the appropriate form of therapy measures which favor relaxation of the spastic condition and neutralization of the strong acid. In the writer's experience in over 900 cases the neutralization of acid combined with rest, as elaborated by Sippy, has been most successful. Hospital rest is preferable for several reasons: It permits checking up of the hydrochloric acid to avoid alkalization as well as inadequate neutralization, checking up the stools for occult blood, and the subsidence of symptoms controlled by fluoroscopic examinations. It provides an opportunity to educate the patient regarding the nature of peptic ulcer and the necessity of following the regimen outlined. A carefully evalnated history, together with an analysis of the chemical and roentgenological data are the three basic constituents for the diagnosis of ulcer. With our increasing knowledge of gallbladder and colon disorders, a history of periodic distress occurring at certain times after meals, with food and soda relief, can no longer be considered as positively diagnostic. most helpful part of a history is an accurate description of a typical day with distress, including a list of the food eaten at each meal, and an exact record of the time of occurrence and character of the distress, with the exact effect of all measures, such as rest, food alkalis, or bowel movement. The criteria upon which the decision of curability is based are (1) the disappearance of the x-ray defect, (2) the subsidence of symptoms, (3) the complete disappearance of occult blood from the stools. It is generally agreed today that medical treatment should be tried before surgery is contemplated. The commonest errors in the treatment are the use of too little food, or too little variety in the food, for the ambulatory patient: the use of too much magnesia and of larger doses of alkalis than are necessary, and failure to forbid the use of alcohol and nicotine. The theory generally held a few years ago, that pyloric obstruction with twenty-four to forty-eight hours retention of barium should be relieved by surgery has been abandoned. Many of these patients are now being relieved by medical management.-New England Journal of Medicine, November 6, 1930, xcciii, 19.

The Spleen as an Organ of Internal Secretion.-G. P. Sakharoff, writing in the Revue française d'Endocrinologie of August, 1930, points out two reasons why the spleen should be regarded as an endocrine organ: first, because it produces a special substanceleucocytolysine-which dissolves the white cells of the blood, and secondly, because of the influence exerted by the spleen upon heredity. This substance entering the blood stream, has an influence upon all parts of the circulatory apparatus, thus regulating in a great measure the morphologic composition of the blood, especially as regards leucocytes. In the leucocytolytic function we see the regulation of at least one special substance poured directly into the blood and producing an effect throughout the entire circulatory system. Findings of another character also suggest that the spleen is related to other organs of internal secretion. Thus Sakharoff has found in splenectomized mice a number of corpora lutea in excess of the animals in the litter. This agrees with the findings of certain Serbian workers in respect to the early rut of splenectomized mice due to absence of the restraining action of the splcen upon the ovaries, expressed here in the early maturation of the follicles and their rupture in a number greater than normal. An increase in the number of offspring in the litter of splenectomized mice has also been noted. In the second generation such offspring present a stable leucopenia which is maintained through subsequent generations showing no tendency to return to normal. The influence of splenectomy is also observed in the transmission of the color of the fur, which tends to pass into grey. In the crossing of normal white females with yellow males a certain number of grey or white specimens are obtained. But in the crossing of the same males with splenectomized females the number of grey specimens increases in proportion to the time elapsed from the moment of splenectomy, and since the color of the fur is determined by heredity the question of the influence exerted upon the chromosomes naturally arises. The crossing of splenectomized grey or yellow males with normal albino females produces in the fur of the progeny a displacement toward white. We are therefore led to the conclusion that splenectomy causes nutritive changes that act upon the cytoplasm of the genital cells, producing modifications which are reflected in the heredity by clearly characterized displacements.

## LEGAL

## EXECUTOR AND TRUSTEE—AMOUNT OF COMMISSIONS

By LORENZ J. BROSNAN, ESQ.
Counsel. Medical Society of the State of New York

When an individual makes a will and names therein an executor or trustee, such executor or trustee, upon qualifying as such and accepting the trust and responsibility reposed in him by the testator, is entitled upon the winding up of the estate to compensation in the manner fixed by the provisions of our Surrogate's Court Act applicable thereto. The compensation so fixed is the same whether the executor or trustee be an individual or a corporate fiduciary.

Section 285 of the Surrogate's Court Act provides, so far as material, as follows:

"On the settlement of the account of any executor \* \* \* or testamentary trustee, \* \* \* the surrogate must allow to such executor \* \* \* or testamentary trustee for his services in such official capacity, and if there be more than one, apportion among them according to the services rendered by them respectively:

"For receiving and paying out all sums of money not exceeding two thousand dollars, at the rate of five per

centum.

"For receiving and paying out any additional sums not amounting to more than twenty thousand dollars, at he rate of two and one-half per centum.

"For receiving and paying out any additional sums not exceeding twenty-eight thousand dollars at the rate of one and one-half per centum

of one and one-half per centum.
"For all sums above fifty thousand dollars, at the rate

of two per centum.

"If the gross value of the principal of the estate or und accounted for amounts to one hundred thousand lollars or more, each executor \* \* \* or testamentary rustee is entitled to the full compensation on principal nd income allowed herein to a sole executor \* \* \* or estamentary trustee, unless there are more than three, which case the compensation to which three would e entitled must be apportioned among them according the services rendered by them respectively."

It will be noted that the law provides that here the gross value of an estate amounts to ne hundred thousand dollars or more, executors and trustees up to the number of three shall be lowed full commissions. In estates whose gross thue is less than one hundred thousand dollars, the one full commission will be allowed no matrice how many executors and trustees are named the testator, such full commission to be apportuned among them in proportion to the services by rendered.

It sometimes happens that the testator will prole that the executor or trustee shall receive a tain lump sum in lieu of the commissions to ich he would otherwise be entitled under the tute. In such event such executor or trustee is not entitled to receive the compensation provided by statute unless, within four months from the date of the issuance of letters testamentary in the case of an executor or of the filing of an oath of office in the case of a testamentary trustee, such executor or trustee files with the Surrogate a written instrument renouncing the specific compensation provided for in the will.

A very interesting question arises where the same person is named as executor and as testamentary trustee. In many instances it is common for a testator to name the same individual as executor and as trustee. Broadly stated, the executor's duty is to wind up the estate and when this is done it becomes his duty to turn over the assets of the estate to the testamentary trustee, the trust to be administered according to the terms and provisions of the will. same individual is both executor and trustee, the question has arisen as to whether double commissions should be paid; that is to say, whether commissions should be allowed to such individual in both capacities, first as executor and then as trustee. This question was squarely presented to one of our Surrogate's Courts very recently.

In the case in question, a trust company was named in a testator's will both as executor and as trustee, and when the said trust company filed its accounting in the Surrogate's Court it claimed commissions in a dual capacity, both as executor and as trustee. The importance of the problem was very well stated by the learned Surrogate as follows:

"This question is one which is raised in a very large proportion of cases of executorial accounting and is a matter of serious import to the estates of decedents. There is, of course, no question respecting the right of the person administering an estate to commissions on all income received and paid out by him. The sole problem is whether, when the same person acts throughout the entire period, from the death of the decedent to the final distribution of all sums in the estate to the ultimate persons entitled in possession by the provisions of the decedent's will, he should be allowed to divert from the objects of testator's bounty ten per cent of the first \$2,000 principal, five per cent of the next \$20,000, three per cent of the next \$28,000, and four per cent of all sums beyond, or whether, under such circumstances, one-half of these rates is all he should be paid.

"The aggregate of such additional commissions, if properly allowable, will inevitably total a stupendous figure. The total value of all property in the county amounts to many billions; that in the State represents approximately a quarter of the entire wealth of the richest nation on earth. The possessions comprising this

wealth, as a whole, change hands through death, approximately five times in every century. A difference, therefore, of only an average of two per cent in the capital exactions of fiduciaries upon the portions of estates in which immediate possession is suspended, must in a generation involve such colossal sums as almost to stagger the imagination. When it is realized that this fiduciary relationship is being more and more centered in an ever-diminishing number of large corporations, the consequent effects upon the future of the State and nation and the lives and fortunes of our citizens are worthy of the most careful study and critical analysis.

These observations are in no way to be construed as a disparagement of the valuable contributions made by corporate fiduciaries in the administration of estates or the propriety of adequate recompense to them for services performed. The sole question for determination is as to the basis for their recompense under existing statutes and judicial determinations, which, if furnishing insufficient remuteration, should be altered by direct

legislative action rather than by indirection.

"Experience in this court has indicated that the estates in which possession of portions of the principal is postponed by testamentary direction, will average a net sum, exclusive of funeral and administration expenses, of approximately \$100,000. On such estates, funeral charges, attorneys' fees and other administration expenses and double commissions, if allowable, will eat up about onetenth of the estate if litigation or unusual difficulties are not encountered. In the event of such complications, the proportion of administration costs will, of course, frequently run much higher.

The court then went on to show that an individual who instructs his attorney to draw a will naming the same person as executor and as trustee never intended that his estate should be depleted by such individual obtaining commissions in both capacities. The opinion of the court in this respect is extremely interesting:

"As a matter of strict fact, it is probable that scarcely one testator out of a hundred realizes that the savings which he has accumulated by a lifetime of labor and self-sacrifice to insure the continuation in comfort of his dependents when he can no longer personally care for them, will be so largely depleted by commissions and administration expenses as is the practice. Nor does he understand that a slight change in a word or phrase in his will may double the sum which will be subtracted as commissions from the principal fund which he desires to dedicate to the welfare of his dependents. By a legal fiction the language of the will, however technical and complicated, is perhaps necessarily attributed, in all its subtlety, to the testator, no matter what the degree of his lack of understanding of its technical connotation, or even of his positive illiteracy. It cannot be gainsaid that in the average case where a so-called trust is set up in a testamentary document and the one to whom the administration has been confided seeks commissions on the principal at the double rate, all that the testator directed when instructing his attorney in the preparation of his will was that specified persons should have the income from a certain sum or portion of his estate for life and on their deaths it should go to others Where, under such an instrument, the same administrator is to handle the fund throughout, it would un-

questionably be a matter of great surprise to the average testator to learn that his attorney, consciously or unconsciously, had it in his power to double the exaction from the fund by a slight change of phrase or a substantially immaterial manner of directing the same administrator to pay the same money to the identical individual. Under our legal system every man is, of course, presumed to know the law, but this is a very different matter from a solemn determination that in a given case a specified testator actually affirmatively intended that the individual or corporation selected to administer his affairs from start to finish should receive a double payment from the principal funds of his estate, where such individual or corporation merely shifts the fund from one pocket to another and it remains continuously in his or its pos-

"It is contrary to human nature for any person to desire to pay a larger sum for a given service when the identical act may be secured for half the amount from the same individual."

In holding that the executor and trustee was entitled to only one commission, the Surrogate said:

"It may perhaps be felt that the discussion of this question has been extended beyond a reasonable length, particularly since the views of the court on the subject have been expressed on previous occasions. It should be recalled in this connection, however, that the position of the court in this regard has never before been seriously challenged, and since the questions here involved are presented virtually ex parte by representatives of those financial institutions which will profit to the extent of an almost incalculable aggregate sum if a contrary rule should be established, it is incumbent on the court, as the trusted guardian of the interests of the fatherless and the widow, to clarify its position so far as possible in order that an appellate tribunal may have such benefit as may be derived from the experience and research of the court of first instance to which this problem is a matter of daily occurrence. The far-reaching importance of a determination of the subjects here involved is difficult of exaggeration. Every testator relies upon the surrogate in the first instance and the higher courts, if occasion requires, to see to it that his property, after his death, is made available without improper diminution, for his family or named beneficiaries. idea to become prevalent that his attorney, by ineptness or inadvertence—eliminating design—could subject his estate to unnecessary exactions and that the courts, by the application of a legal fiction, contrary to the most fundamental concepts of human experience, would uphold such unnecessary diversion, the untoward consequences could not be other than disastrous. It would not only still further undermine the confidence of the public in the legal profession and add to its sometimes cynical attitude toward the law and the courts, but might well have a far-reaching and injurious effect on the habits of thrift and foresight which are a part of the fundaments of our national prosperity."

As the Surrogate points out in his opinion, the question is of far-reaching importance, and the opinion represents a courageous attempt to conserve within reasonable limits the expenses of administering an estate.

ALLEGED NEGLIGENT TREATMENT OF HEMORRHOIDS

In this case a patient called at the office of the defendant doctor complaining of hemorrhoids and gave a history of having suffered from them for several years. He stated that they had been so painful and severe as to disable him from attending to his work for several days at a time and that he had become a nervous wreck because of this condition.

Examination revealed a very bad case of prolapsed internal hemorrhoids and fissure of the The doctor explained to the patient the treatment he proposed to give and it was consented to. The doctor then sterilized the rectum with a 2% solution of mercurochrome and proceeded to anaesthetize the anus by means of an injection of 34% solution of novocaine into the skin and subcutaneous tissue and into the external sphincter muscle both at the anterior and posterior commissure. He next injected into each of the four large hemorrhoids 1 c.c. of 4% solution of quinine and urea, which was the doctor's usual mode of treatment. The doctor further decided to treat the patient with an electric needle and placed an electric pad on the patient's abdomen attaching thereto the positive pole and applying the negative pole at the anus. Then, with the electric needle he punctured the hemorrhoids in several different places and allowed the needle to remain in the hemorrhoids for several moments. The electric treatment did not prove satisfactory, for the patient, even though under anaesthesia, became very nervous and refused to permit the doctor to complete said treatment. The doctor then inserted the hemorrhoids and sterilized the parts again with 2% solution of mercurochrome and applied a dressing pad of sterilized gauze held in place by adhesive plaster. He advised the patient to return to his home and in the event that the hemorrhoids should come out or prolapse, to push them back in himself. The patient informed the doctor that he had done this himself a number of times before.

That evening the doctor received a telephone call from the patient's wife informing him that the patient was in severe pain and requesting him to make a personal call. The doctor told her to apply hot applications and compresses and to give him two morphine tablets. The doctor had previously given the morphine tablets to this patient with instructions to take them in case of severe pain. The doctor, however, did not call perpare the patient with instructions to take them in case of severe pain.

sonally at the patient's house as he thought it would be unnecessary to do so.

The next day the doctor went to see the patient and found that the hemorrhoids had come out and that they had not been replaced, and that the hot applications had not been applied according to his instructions. The doctor tried to insert the hemorrhoids but failed to do so owing to the fact that they had swollen since the previous day, and the patient refused to permit the doctor to satisfactorily treat them, complaining of great pain. The doctor then left the patient with instructions to keep hot applications on the hemorrhoids in order to reduce the swelling., The patient was seen by the doctor for several subsequent days and on all of these occasions the doctor bathed the affected parts with a boric acid solution and with a 2% solution of mercurochrome. On one occasion the doctor tried to inject a quinine and urea solution as a local anaesthetic, in order to relieve the pain and release the muscle spasm and in this way to permit the protruding hemorrhoids to be inserted or to go back of their own accord, but the patient flatly refused to allow the doctor to inject anything. Gradually the swelling of the parts was reduced and one hemorrhoids disappeared entirely, the other three being much smaller. However, there was some sloughing of the skin resulting from the distension, congestion and compression.

At this point, the patient's wife apparently being dissatisfied with the results of the treatment told the defendant doctor that she would like to have another physician see her husband. The second doctor was called in consultation with the defendant, and after the consultation it was decided that the second doctor should continue treating the case. The defendant doctor did not see the patient again and was informed subsequently that the patient was removed to a hospital and the hemorrhoids removed by an operation

Suit was instituted against the doctor for malpractice, alleging negligent treatment of the hemorrhoids. The case was duly brought on for trial and at the conclusion of the testimony on behalf of the plaintiff, a motion was made to dismiss the complaint for the reason that the facts claimed by the plaintiff did not constitute a cause of action. This motion was granted, thus disposing of the case in favor of the doctor.

## NEWS NOTES

#### QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held in affiliation with the Queensboro Tuberculosis and Health Association at the Oakland Golf Club, Bayside, L. I., on September 23rd, 1930, with 104 members present. It was preceded by a golf tournament and a dinner, during which president E. A. Flemming, M.D. of the Medical Society and president Mr. Henry C. Wright of the Queensboro Tuberculosis and Health Association were speakers. The scientific session of the Society was given precedence, and the following program was presented:

Address: "Some Aspects of the Prevention of Tuberculosis in Children," by Dr. F. Maurice Mc Phedran, Phipps Institute, Phila-

delphia, Pa.

Discussion by Drs. Edward S. McSweeny, Henry A. Reisman, and Walter C. A. Steffen.

Dr. Frederick H. Fechtig, was elected to active membership, and Dr. James Joseph Flemming, to associate membership.

The transfer of membership of Dr. Sidney Wilensky from the Medical Society of the County of Queens to the Medical Society of the County of New York, was announced.

An abstract of the report of the Comitia

Minora follows:

A regular meeting of the Comitia Minora was held Wednesday evening, September 10th, with President Flemming, Vice-President Voltz, Secretary Smith, Treasurer Dobbins, and Drs. Courten, Lavelle, Riley, Thomas, Reuling and Mencken in attendance.

A letter from the Chamber of Commerce calling attention to a "Queensboro Exposition of Progress and Prosperity" was presented and a committee consisting of the Executive Committee and Dr. Mencken appointed with power to give it such consideration as after investigation they deemed wise.

The Secretary reported the attendance of delegates Drs. Chalmers, Flemming, Smith, Moss, Boettiger, and Lavelle, at the meeting of the House of Delegates of the State Society

in Rochester on June 2nd and 3rd.

The Secretary reported his attendance at the meeting of the Secretaries held at the invitation of the State Society in Albany on Tuesday, September 9th.

Treasurer's Report:

 Income, May 10th to Sept. 10th inclusive
 \$3,023,38

 Disbursements
 7,751,15

Balance in checking account. \$342.46 Balance in initiation fund.. 1,555.61

Total cash on hand......\$1,898.07

Bills were approved to the amount of \$52.59 Dr. Mencken for the Committee on Graduate Education reported plans for the resumption of Friday Afternoon Talks beginning with October 3rd, at which time Frederick C. Lemmerman, President of the Chamber of Commerce, Borough of Queens, and William J. Russell, Executive Vice-President, will address the Society.

Dr. Carl Boettiger, of the Committee on Public Health and Public Relations, reported that the chief activity of this committee during the summer was the organization of the Queens County Cancer Committee, Dr. M. Weinstein acting as its chairman. Arrangements have been completed with the New York City Committee whereby the Queens County Committee will participate in the annual campaign for funds which will take place during November. Funds thus obtained will be applied to the work of cancer prevention in this boro.

At its last meeting the Board of Trustees assigned a room in the building for the use of the Committee on Public Health and Public Relations and the Queens County Cancer Committee. This room will be suitably furnished and decorated without expense to the Society. There will be a permanent secretary within the next few weeks, also without expense to the Queens County Medical Society. In this room the committee proposes to carry on all the activities of the Committee on Public Health and Public Relations and its subcommittees, and maintain a Public Health exhibit and information bureau in all matters pertaining to its functions.

A report from Dr. Joseph Wrana, for the Committee on Medical Economics, was as follows:

In attempting to iron out certain differences of opinion at present existing between the Compensation Insurance Carrier and the medical profession at large, there have been a series of conferences held this summer by representatives of the State Medical Economics Committee, the committees of the County Societies of the Metropolitan district, and the Insurance Carriers, which were attended by rep-

Edward E. Brown, M.D., 4202 Layton Street, Elmhurst.

George I. Cowan, M.D., 22-04 33rd Street, Astoria.

M.D., 134-11 231st Friedlander, Harold Place, Laurelton.

Robert A. Kroehler, M.D., 231-05 138th Ave-

nue, Rosedale.

Iulius Lebovitz, M.D., 48-01 43rd Avenue,

Long Island City.

Arthur P. MacVeany, M.D., 279 Ascan Avenue, Forest Hills.

Charles S. Moiel, M.D., Jamaica Hospital.

S. Edward Navarra, M.D., 145-16 243rd Street, Rosedale.

William B. Quinn, M.D., 5002 47th Street,

Vincenzo Pennisi, M.D., 107-44 Sutphin Boulevard, Jamaica.

Richard L. Saunders, M.D., 9029 153rd Street.

Harry J. Secky, M.D., 2430 35th Street,

Jamaica. Alfred A. Trivilino, M.D., 150-02 88th Ave-

nue, Jamaica.

The President appointed Drs. F. G. Riley, H. C. Eichacker and E. J. Buxbaum a nominating committee.

The Society passed a resolution whose closing paragraph reads:

"Be it further resolved, that 'Principles of Professional Conduct' are necessary, beneficial, just and equitable, and that this Society calls upon all of its members and upon the Executive Committee of the State Society rigidly to enforce the provisions of 'Principles of Professional Conduct' and to confer with the Board of Censors of this Society or with the State Grievance Committee regarding any violations of the Medical Practice Act."

Scientific Session:

"The Diagnosis of Acute Surgical Diseases of the Abdomen," by Joseph S. Thomas, M.D. Discussion by Drs. Griswold D. Nammack, Denis E. McMahon, Howard W. Neail, Morris Bender and Lester Samuels. Closed by Dr. Thomas.

"Blood Transfusion." Some new and original work on Blood Tapping and Blood Matching, with lantern slides, and moving pictures. A new and practical way of entering the vein in blood transfusion, by John Matthew Scannell, M.D., Discussion by Drs. Emil F. Koch, E. J. Buxbaum and Jacob Werne. Closed by Dr. Scannell. Attendance, 140.

E. E. SMITH, Secretary.

#### SUFFOLK COUNTY

The 124th Annual Meeting of the Suffolk County Medical Society was held at the Henry Perkins Hotel, Riverhead, N. Y., Thursday, October 30th, 1930, with the President, Dr. Albert E. Payne, presiding and the Secretary, Dr. Edwin P. Kolb, recording. There were in attendance 50 physicians and 15 nurses and other guests, a

The report of the Public Health and Public Relations Committee was given by the Chairman, Dr. Frank Overton, who suggested the need of a committee on Economics to deal with conditions and opportunities growing out of the new Welfare Law.

On motion the formation of a committee on Economics was authorized, and Drs. W. H. Ross, David Edwards, and Frank S. Child were named its members.

Dr. William Tiffany, Chairman of the Publication Committee, reported that the Monthly News Letter was now being issued regularly with Dr. Frank S. Child as editor.

The meeting discussed the legal standing of an x-ray laboratory conducted without the supervision of a physician. A complaint regarding such a laboratory was referred to the Censors.

A resolution was passed endorsing the State fifty-million-dollar bond issue for the benefit of State institutions.

Dr. J. H. Marshall reported on the pressing need of additions to the County Tuberculosis Hospital, and urged each member to inform his supervisor of the need.

Dr. Leroy B. Davis of Westhampton Beach, was elected to membership.

The following officers were elected for the year

President, Wm. J. Tiffany, Kings Park; Vice-President, David Hallock, Southampton: Secretary, Edwin P. Kolb, Holtsville;

Treasurer, Grover A. Silliman, Sayville;

Censors: F. S. Child, Port Jefferson; James Ames, Babylon; and George H. Schenck, South-

Delegates to State Society: Drs. Tiffany and Kolb.

The President's address was delivered by Dr. A. E. Payne, who set forth the need that physicians should take a more active interest in their civic duties.

Dr. Walter L. Niles, Dean of the Medical School of Cornell University, read a paper on "Digitalis Therapy in Pneumonia." He described a long series of cases in Bellevue Hospital, onehalf treated with digitalis and the other half without it, and showed that the death rate was the lower in the half which did not receive digitalis.

E. P. Kolb, Secretary.

#### FOLKLORE OF BODILY INFLUENCE

Doctors occasionally run across beliefs which are folklore handed down by verbal tradition from early antiquity. Such an item is discussed editorially in the New York Herald Tribune of December first, which said:

"The attitude of the London Jew who refused blood transfusion because the only available donor satisfactory to the physicians happened to be a gentile, and because mixture of racial bloods impressed the intended recipient as unendurable, was swayed by one of the two oldest ideas in the world about the essence of human personality. Similar, but springing from a source as ancient, is the familiar distaste, now little but a faded metaphor, to breathing the same air as an alien race or an inferior class.

"We still talk of the 'spirit' of man, forgetting that this once meant no intangible distillation of personality but merely the obvious attribute of breathing. Folklore and literature alike are full of references to the breath of life and similar reminders of the ancient dogma. Even 's kisses have been interpreted not unplausibly as survivals of a custom once intended to mingle the breath so that personalities also might be fused.

"The dogma of the identity of heart and blood with personality came into history later than this, and Mr. Warren Dawson has traced it to the lure of ancient Egyptian physicians who seem to have been the first scientific men not forbidden by religious taboos to dissect the human body. When an Egyptian body was prepared for mummification the only internal organ left intact was the heart. Even the great vessels stretching out from it into the body were left, so fas as possible, untouched. That the Egyptians had any inkling of the circulation of the blood or of the real duties of the heart seems improbable, but they did conceive this organ to be the seat of life and consciousness and the blood to be intimately related thereto. Thence came into men's minds all the complicated lore of purity of blood, of 'bad blood' between rivals, of 'heartfelt' sincerity, and so on, which have dominated the thoughts and the literature of races of whom Egyptians never dreamed. The brain, curiously enough, Egyptian dissectors seemed never to have considered of the slightest importance, and heroes of literature when vowing devotion still press their hands on chests instead of heads."

#### COURSES IN ACADEMIC REPOSE

If you see it on the editorial page of the New York Times, it is probably true. The following item appeared on November 27:

"The least that can be expected of college students is to keep awake in the classroom. But in new courses at Barnard the best thing that a star pupil can do is to go to sleep. These classes in rest and relaxation have been planned to combat chronic fatigue and to forestall malnutrition and kindred ailments due to nervous and physical exhaustion.

"They will take the place of dancing, swim-ming and gymnasium. Instead of three periods of physical activity a week, the chronically fatigued student will sign up for corresponding hours of complete passivity. Five rest classes a day are offered, and students will receive 'full substitute credit.

"A description of class 'work' sounds very like an hour on the sun deck during a vacation cruise. Students relax in comfortable deck chairs on the 'lutely nothing is not so funny after all.

roof of Barnard Hall on sunny days. In bad weather a 'fresh-air room' inside is used, cheered by the warmth of a sun-lamp. Hot bouillon or cocoa is served to the weary ones, who are warmly bundled up in steamer rugs. Talking and reading are forbidden and sleep encouraged. The present enrollment presents fifty-seven varieties of fatigue. The dismissal bell for the class is presumably an alarm clock.

"Perhaps those who sleep the soundest or who gain the most weight will get the highest marks. One talented relaxer has already gained eight pounds. Last year college girls might have objected to such an unearned increment. This year, with fashions calling for rounded silhouettes, the classes may prove the most popular in the entire curriculum.

Possibly we should have verified the existence of the courses; but every doctor knows the difficulty of getting patients to relax, especially the feminine ones. A college course in doing abso-

## TEST FOR GIN AND TOBACCO

The column on the editorial page of the New York Herald Tribune called The Lantern is ostensibly humorous, but it is sometimes newsy and philosophical. Beverly Smith, the author, wrote on December first:

"A friend of mine recently inherited an old house up the Hudson. The cellar was included, and in the cellar were many cases of fine prewar gin. He gave a house warming party, inviting New Yorkers up from the city.

"Before the party began he showed the dusty old bottles to his guests, who exclaimed mightily with admiration and anticipation. Then he produced a shiny new bottle of gin-synthetic stuff ordered by telephone at \$15 a case. Each guest was blindfolded and permitted to taste a teaspoonful of old authentic gin and a teaspoonful of the Out of twenty modern bootlegger's product. guests fourteen preferred the new stuff and picked it as being the old. The fourteen were much chagrined, the more so when the host announced that this honest preference, made blindfold, would be rigorously respected in dispensing drinks during the evening.

"Does this testify to a decline in the modern American taste, or to the skill of the modern bootlegger, or to the fact that no gin is fit to drink anyway? Draw your own moral."

The quality of tobacco would seem to be equally elusive, for a blindfolded smoker can seldom tell whether or not his cigar or pipe is lighted. Yet, after all, the differences in the qualities of various brands of tobacco are real and detectable.

#### HUNTERS' CASUALTIES

The New York Herald Tribune of November 26 has the following item on casualties among hunters this fall:

"Eighty-seven people have been killed or injured in New York State so far this season, according to figures compiled by the conservation department. Of this number twenty-eight were killed and fifty-nine injured. In addition, one hunter who became lost in the woods was found Twenty-nine hunters were shot by the accidental discharge of their own guns, forty-six were shot by companions, eight were shot by other hunters and four were hit by stray bullets.

"Nine deer hunters were killed and eight injured. Three duck hunters were killed and six injured. Nine hunters were killed hunting birds and thirty-two were injured. Miscellaneous shooting accounts for the balance of the casu-

"The total number of hunting casualties this year was the smallest in the last four years, but the percentage of fatalities was high. Hunting accidents have not increased in proportion to the increased number of licenses issued each season. In 1925, with about one-half the number of hunters in the woods as there were this year, the season's casualties were considerably higher.'

## HEALTH VICTORIES

Sickness and pain have always excited the pity and charity of men, but in these later days health is glorified and deified, even as it was in ancient Greece. The New York Times commented on the subject of health victories editorially on July 17, as follows:

"Epictetus, himself a 'lame old man,' wrote a hymn of thanksgiving to 'God who has given us hands, the power of swallowing, imperceptible growth and the power of breathing while we sleep.' But man has lately done a great deal in cooperation with the Creator to lengthen the average period during which he may continue to enjoy those powers. This does not mean that the former maximum span of life has been lengthened, except perhaps in cases when the gentle and skilled hand of nursing protects the flame that

would otherwise have been blown out by the gusts of nature. It means only that more people live longer, or, as stated in the summary of the report of the commission of the American Medical Association and the National Education Association in yesterday's Times, the 'average expectancy of life' has been lengthened twenty years in this country in the last seventy-five years.

"There have been great victories, and no doubt the shadow of death will be pushed still further back by the researches and patient watchfulness and all but divine skill of those who have entered

this battle for human welfare, and especially for those who have been lately invited by the older generation to take for their birthright, in Robert Bridge's phrase, as vast a heritage as their bodies

have in 'the immemorial riches of mortality'."

## BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their ments, or in the interests of our readers,

- EPHEDRINE AND RELATED SUBSTANCES. By K. K. Chen and Carl F. Schmidt. Octave of 121 pages. Baltimore, Williams & Wilkins Company, 1930. Cloth, \$2.50. (Medicine Monographs Vol. 17.)
- DIET AND DISEASE. By George A. Harrop, Jr., M.D. Octavo of 404 pages with 80 tables. Philadelphia, P. Blakiston's Son & Co., Inc., 1930. Cloth, \$4.00.
- RECENT ADVANCES IN DISEASES OF CHILDREN. By Wilfred J. Pearson, D.M. and W. G. Wyllie, M.D., M.R.C.P. Second edition. Octavo of 548 pages; illustrated. Philadelphia, P. Blakiston's Son & Co. Inc., 1930. Cloth, \$3.50.
- Rose and Carless' Manual of Surgery. By Cecil P. G. Wakeley, F.R.S., Edin., and John B. Hunter, M.C. Thirteenth Edition. Octavo of 1592 pages, illustrated, with radiographic supplement. New York, William Wood & Company, 1930. Cloth, \$11.00.
- OUTLINE IN OBSTETRICS FOR NURSES. By F. W. Rice, M.D. Octavo of 228 pages, illustrated. St. Louis, The C. V. Mosby Company, 1930. Cloth, \$2.00.
- RIDERS OF THE PLAGUES The story of the conquest of disease, By James A. Tobey. Octavo of 348 pages, illustrated. New York, Charles Scribner's Sons, 1930. Cloth, \$3.50.
- Grow Thin on Good Food. By Luella E. Axtell, M.D. 12mo. of 336 pages. New York & London, Funk & Wagnalls Co., 1930. Cloth, \$2.00.
- Nervous Indicestion. By Walter C. Alvarez, M.D. Octavo of 297 pages. New York, Paul B. Hoeber, Inc., 1930. Cloth, \$3.75.
- Leonardo da Vinci, The Anatomist. By J. Playfair McMurrich. Octavo of 265 pages. Illustrated. Baltimore, Williams & Wilkins Company, 1930. Cloth. \$6.00.
- ELEMENTARY ZOOLOGY FOR MEDICAL STUDENTS. By L. A. Borradaile, Sc.D. Second Edition. 12mo. of 397
  pages, illustrated. New York & London, Oxford University Press, 1930. Cloth, \$3.50. (Oxford Medical Publications.)
- HISTOLOGY FOR MEDICAL STUDENTS. By H. Hartridge, M.A., M.D., and F. Haynes, M.A. Octavo of 369 pages, illustrated. New York & London, Oxford University Press, 1930. Cloth, \$5.00. (Oxford Medical Publications.)
- A Техт-Воок ог Ратиолосу. Edited by E. T. Bell, M.D. Octavo of 627 pages, illustrated. Philadelphia, Lea & Febiger, 1930. Cloth, \$3.00.

## BOOK REVIEWS

A SURVEY OF THE LAW CONCERNING DEAD HUMAN BODIES. By GEORGE H. WEINMANN. Octavo of 199 pages. Washington, D. C., The National Research Council of the National Academy of Sciences, 1929. Paper, \$2.00. (Bulletin of the National Research Council No. 73.)

"The survey of the law covering dead human bodies" by Mr. Geo. H. Weinmann, L.L.B., which forms one of the Bulletins of the National Research Council, provides a long needed careful and laborious survey. Great credit is due him for his complete and painstaking effort. It covers the subject in such a way that it makes a very useful and comprehensive work on this subject and it should certainly be in the hands of every hospital superintendent and pathologist. It is a novel work. We have never seen embodied in one single pamphlet such an all inclusive treatment of this subject.

It is regrettable that there is a lack of uniformity of the laws in the various states concerning the handling of dead bodies. To the physician this subject is of particular interest in the matter of obtaining autopsies to increase his medical knowledge. Frequently because of his lack of knowledge of the law he commits a tort and becomes a subject in a legal action. Criminal investigations are badly hampered and often made impossible because of the interference of the hospital pathologist or interne in performing autopsies on bodies which are subjects of criminal investigation and defeat justice by reason of their lack of knowledge of the law.

M. E. MARTEN.

A Manual of Diseases of the Nose and Throat. By Cornelius G. Coakley, A.M., M.D., F.A.C.S. Seventh Edition, revised. Octavo of 672 pages, illustrated. Philadelphia, Lea and Febiger, 1930. Cloth, \$4.50.

The seventh edition of this well-known book is forwarded to us by the publishers. It is enough to say in its favor that this is the seventh edition, larger than the early editions by showing little change in its make up with the exception that the addition of new matter is evident and many new illustrations have been added.

W. C. BRAISLIN

OBSTETRICS FOR NURSES. By JOSEPH B. DELEE, A.M., M.D. Ninth Edition. 12mo of 654 pages, illustrated. Philadelphia and London, W. B. Saunders Company, 1930. Cloth, \$3.00.

When a text-book has reached the ninth edition it is, of course, fairly well known to the public, and when the same volume has been written by such a distinguished and widely known author as Dr. DeLee, little need be said about it, except to stamp it as standard.

The new edition has been rewritten and brought completely up to date. New illustrations, photographs and drawings have been added, together with step-by-step pictures that supply students quickly and clearly with the important details of obstetrical nursing.

The volume is divided into three parts. Part I deals with the physiology and anatomy of the reproductive organs, together with a chapter on the changes which occur during pregnancy, one on the infant and one on the hygiene of pregnancy. Part II considers the management of pregnancy, labor and the puerperium and teaches the proper care of the patient during these periods. Part III deals with the nathology which may disturb the normal course of theselthree stages of reproduction.

The book is written from the nursing viewpoint, and it is a very excellent text-book. W. S. S.

OBSTETRICS FOR NURSES. By CHARLES B. REED, M.D., F.A.C.S., and CHARLOTTE L. GREGORY, R. N., B.S., M.D. Third Edition. Octavo of 399 pages, illustrated. St. Louis, The C. V. Mosby Company, 1930. Cloth, \$3.00.

This little book is very good. As usual though, too much space is alloted to abdominal palpation, vaginal examinations, and the mechanism and management of unusual presentations and positions. The nurse never needs this information; and many doctors practice obstetrics, in a casual way however, without any more idea of it than they have. What the nurse really needs is a thorough knowledge of asepsis and its exact meaning. With this, intelligence and experience, she is well qualified. On the whole a useful, readable book. C. A. G.

ULTRA-VIOLET RAYS IN THE TREATMENT AND CURE OF DISEASE. By PERCY HALL, M.R.C.S., L.R.C.P. Fourth Edition. Octavo of 248 pages, illustrated. St. Louis, The C. V. Mosby Company, 1930. Cloth, \$4.50.

In this fourth edition of his book the author has brought the work strictly up to date. The opening chapters are devoted to a discussion of the history and properties of light therapy. There follow three chapters describing in an impartial manner the apparatus available for the production of artificial light. The remainder of the book presents an exposition of the use of light both natural and artificial. Actinotherapy in all its branches is thoroughly covered, including its application to dentistry and the medical specialties. Light therapy in the municipal clinic and in the home is discussed. These latter uses are of rapidly growing importance, and their discussion is timely. The book is well written and clearly printed and illustrated, and can be recommended to the reader as an interesting and authoritative presentation of its subject.

A System of Bacteriology in Relation to Medicine. [By Various Authors. Prepared under the direction of the Medical Research Council.] Vol. II. Octavo of 420 pages. Vol. IV. Octavo of 482 pages. Vol. V. Octavo of 506 pages. London, His Majesty's Stationery Office, 1929. Cloth, £8-8-0 a set; £1-1-0 each.

In a previous review the scope of this system, in which each section is written by an eminent British authority, was outlined.

Volumes II and IV are now at hand. The former is devoted to the staphylococci, streptococci, gonococcus, meningococcus, influenza and pertussis; the latter to typhosus, the salmonella group, dysentery, the colon group, the cholera vibrio and the pasteurella group.

The authors use both the old classification and the new one of the American Society of Bacteriologists. Each organism is discussed systematically giving its history, cultural characteristics, biochemistry, serology, pathology in animals and man, mode of transmission, immunity, diagnosis, prevention and treatment. The reviewer does not know of any other work in English which gives such a complete discussion of the subject.

Volume Five of this System discusses the following bacteria and diseases: Glanders, diphtheria, tuberculosis, Johne's disease, leprosy, the brucella group, anthrax and tularemia.

There is a full discussion of tuberculosis from many angles, which makes this chapter most interesting. Because of the increasing interest in undulant fever, the long chapter on the brucella infections in man and animals is most timely. This is a complete summary of our present knowledge of undulant fever and should be read by every physician. The chapter on tularemia is E. B SMITH also worth reading.

INFANT NUTRITION: A Text-book of Infant Feeding for Students and Practitioners of Medicine. By WILLIAMS McKIM MARRIOTT, B.S., M.D. Octavo of 375 pages, illustrated. St. Louis, The C. V. Mosby Company, 1930. Cloth, \$5.50.

A valuable addition to the book shelves of the man who concerns himself with the management of babies. An unusual fount of information on the management

of dietary problems written simply and interestingly Chapters-3, 4 and 5 on Metabolism deserve special mention for their clearness and conciseness. This could only have been written by one who knows the subject thoroughly.

Many other parts are worthy of note, mainly the chapter on Celiac Disease (22) and especially the one on

vomiting (23).

The reviewer takes pleasure in recommending the book to those who wish to "brush up" on Baby Feeding and to those who wish to begin a course of more intensive study of the subject.

The material is well chosen and ably written Its author should be congratulated. H. APFEL.

Physiology and Biochemistry in Modern Medicine. By J. J. R. Macieod, M.B., Ll.D., D.Sc., F.R.S. Sixth Edition. Octavo of 1,074 pages, illustrated. St. Louis, The C. V. Mosby Company, 1930. Cloth, \$11.00.

This is the sixth edition of a modern classic. It has been possible, through much typographical shrewdness, so to speak, to keep this standard work of the same size as the preceding edition. It is to some extent the work of a group of men ably collaborating with Macleod. Practically all new and old (that has stood the test of time) knowledge in physiology and chemistry is within the covers of this work, covering the vast fields of the physicochemic basis of physiological processes, the blood and the lymph, the neuromuscular system, the special senses, the circulation of the blood, respiration, digestion, the excretion of urine, metabolism, and the endocrine organs. A Bible of physiology; a gospel of biochemistry. A. C. J.

MEDICAL CLINICS OF NORTH AMERICA. Published every other month by the W. B. Saunders Company, Philadelphia and London. Per Clinic Year (6 issues): Cloth, \$16.00 net; paper, \$12.00 net. Vol. 13, No. 4. January, 1930. (Philadelphia Num-

ber.)

The three hundred pages of this number present a variety of topics, among them The Etiology and Pathology of Arthritis; Lipoid Nephrosis; Streptococci in Relation to Rheumatic Disease, by Small; Study of the Heart Borders, and the Hypoglycemia Hazard in the Treatment of Diabetes Mellitus. W. E. McC.

Vol. 13, No. 5. March, 1930. (Chicago Number.) This issue of the Medical Clinics is thoroughly practical and therefore should be of value to the general practitioner. There is a chapter dealing with some common clinical mistakes, and corroborated by autopsy findings. Then there is a consideration of undulant fever from the diagnostic standpoint. The topic of appendicitis in children is well summarized. The subject of heart disease is of course not overlooked. And so one may wander into quite a number of topics of common EMANUEL KRIMSKY. professional interest.

Vol. 13, No. 6, May, 1930. Index Number. (Mayo ('linic Number.)

There are 24 chapters to this number of the Medical Clinics contributed entirely by the Mayo Clinic. One writer maintains that hypertension is not a contributing factor in causing hemorrhage in gastric or duodenal The association of angina pectoris with toxic goiter is discussed. The concomitant improvements in both instances are illustrated by case experiences. Injuries to the spine are thoroughly reviewed. One of the contributors maintains that the prostate gland is comparatively rare as a focus of infection. A perusal of this issue will reveal much of practical importance to the general practitioner. EMANUEL KRIMSKY

DIABETES: Directions for Treatment by Insulin and Diet, By Benjamin F. Smith, M.D. 12mo of 223 pages. New York and London, D. Appleton and Company, 1930. Cloth, \$2.00.

Of the large number of manuals on diabetes written in non-technical language for the diabetic patient and practising physician, it is the impression of the reviewer that this little manual is one of the best. The author devotes a few pages to a description of the clinical aspects of the disease, and confines the remainder of the book to a listing of a large and varied group of menus, with a liberal variation in recipes. The book should prove a very useful addition to the list of manuals from which the physician can select for the training of his diabetic patients. WILLIAM S. COLLENS

THE INTERNATIONAL MEDICAL ANNUAL: A Year Book of Treatment and Practitioner's Index. Editors: CAREY F. COOMDS, M.D., and A. RENDLE SHORT, M.D. Forty-eighth Year, 1930. Octavo of 598 pages, illus-New York, William Wood and Company. 1930. Cloth, \$6.00.

In its 48th year the scope of this book remains the same, the matter consisting of abstracts of the leading articles from European and American medical journals. The various sections are edited by most of the best known physicians of Great Britain.

It is a high grade book and will be found most useful W. E. McCollom. for reference.

SURGICAL CLINICS OF NORTH AMERICA. Published every other month by the W. B. Saunders Company, Phila-delphia and London. Per Clinic Year (6 issues): Cloth \$16.00 net; paper, \$12.00 net.

Vol. 9, No. 5. October, 1929. (Philadelphia Number.) This issue contains a number of excellent contributions and all the fields of surgery are well represented. The and all the neus of sugar, and reviewer feels, however, that some of the rightly to periodicals devoted entirely rather than to a journal which avoved rather than to a journal which avoved the result of the resul general practitioner and general surgeon. Vol. 9, No. 6. December, 1929. (Lahey) -Index Number.)

The editors of this issue are to be ... the excellent material at their dispos-100 ing characteristics of all studies Lalley Clinic-their thoroughness and tance-are prominent in each contrib ent volume.

Thyroid surgery in all its spinal and general, and portance to the ger cuseed by

## OUR NEIGHBORS

#### DAILY PRESS IN TENNESSEE

The August issue of the Journal of the Tennessee State Medical Association comments editorially on the subjects and sources of the items in its news department and says:

"Most of the material for the news section of this Journal is obtained from a press clipping service. All the papers in Tennessee are supposed to be read by this agency and every item mentioning doctors, medicine and hospitals is sent to us. Some additional news items are supplied by county secretaries, but the greater part of what you read in the news section of the Journal is based on clippings.

"This month we have analyzed these clippings and find them subject to being classified under

several heads.

"1. Out-of-State News. A report of the death of Dr. Harvey Wiley and a picture of Dr. E. Starr Judd, President-Elect of the American Medical Association, are typical of the news classified under this head. A total of 10 clippings was received this month.

"2. Deaths. Seven doctors died during the period covered by our clippings. One of these deaths was reported in six different clippings. Other deaths in a fewer number of papers. A total of 19 clippings come under the head of deaths.

"3. Medical Societies. Ten meetings of county societies were announced and recorded by the State press. One meeting secured six notices, other a fewer number. A total of 18 clippings was received.

"4. Personal. The three thousand doctors in Tennessee received some publicity of a personal nature during the month. Such items were as follows: the plans of one doctor to buy an airplane, two other doctors' addresses before luncheon clubs, the third doctor won a suit against an insurnace company, several doctors moved their offices, the picture of a physician's bride, hospital interns. The clippings classified under this head numbered a total of 33.

"5. Public Health. Clinics, units, reports, conferences, visits of distinguished doctors, talks and

death rates were reported in 93 clippings.

"6. Miscellaneous. 'Medical Students in Military Camps,' 'Tuberculosis in Shelby County Cows,' 'The Country Doctor,' 'New Medical Buildings,' medical auxiliary notes, and such items were classified under this head and were reported in a total of 19 clippings.

### Summary

"If 'reading maketh a full man,' the people of this State were filled along medical lines last month in the following proportion:

Class	Clippings	Percentage
1. Out-of-State News	10	5.21
<ul><li>2. Deaths</li><li>3. Medical Societies</li></ul>	18	9.89 9.37
<ul><li>4. Personal Mention</li><li>5. Public Health</li></ul>	33	17.19
6. Miscellaneous	93	48.43 9 <b>.</b> 89
Total	192	99 98"

## CRIPPLED CHILDREN IN WEST VIRGINIA

Crippled children have received official attention in several states. A conference on their care in New York State was the subject of an editorial in this Journal of February 1, 1929, page 159; and agreements and a fee list were described in the same issue, page 170.

Reports from other states abstracted in this Journal are as follows:

Kentucky, February 1, 1929, page 188. Oklahoma, June 15, 1929, page 783. New Jersey, January 1, 1930, page 50. occur di 121va, June 15, 1930, page 753.

the hygiene of programment of pregnancy, impled children in West Virginia ment of pregnancy, in symmetries and of the West ment of pregnancy teaches the proper care of the West teaches the proper care of the follows:

the history of the State, according to records in the office of the Crippled Children's Council. The concerted action of parents, organizations, and interested individuals following the holding of the diagnostic clinics in the various sections of the State is responsible for the placing of scores of children under treatment. A large percentage of these children are from the rural areas of the State, the parents availing themselves of the opportunity to have an orthopedic specialist examine their handicapped children, and following the advice given.

"A systematic plan of follow-up is carried out after each clinic, with the result that a considerable number of children enter hospitals for care and treatment soon after the holding of the clinics.

scarlet fever can be prevented

## -they proved it at Clay and Berea

The effectiveness of Scarlet Fever immunization measures in the control of epidemics was recently fully investigated. Two epidemics, in Clay and Berea, Kentucky, in 1929, offered an opportunity for thoroughly testing the effectiveness of such measures. The records of the control of these epidemics were published in the Kentucky Medical Journal in November and December, 1929, and make one of the most valuable and inspiring chapters in the history of preventive medicine.

It has been proved without doubt that with proper measures of immunization no susceptible person need have Scarlet Fever. In both active measures for immunization taken. In all of these tests, Squibb Scarlet Fever Toxin was used.

Squibb Scarlet Fever Products are manufactured under license from the Scarlet Fever Committee, and samples of every lot are submitted to it for approval. They are as follows:

Scarlet Fever Toxin for the Dick Test and for more permanent immunization; Scarlet Fever Antitoxin for temporary prophylaxis and for treatment.

## A More Accurate Method of Standardization

For the physician's protection, as well as for that of the manufacturer, there is need of a more accurate method of standardizing digitalis.

Now, as formerly, Upsher Smith is pioneering an improved method of assay which reduces the usual margin of error to the very minimum. In future, Upsher Smith digitalis products will be standardized by comparison with a fixed standard (the International Standard Digitalis Powder).

It is found that the ratio of strength as given by different workers between this standard drug and another remains fairly constant, despite variations of technique.

The strength of Digitalis (Upsher Smith) is now stated, not in terms of absolute cat units, but in terms of International Units, as follows:

## CAPSULES FOLIA-DIGITALIS

(UPSHER SMITH)

1 International Unit (equivalent to about 2 grains of U.S.P. Digitalis Powder)—Packed in bottles of 24, 500 and 1,000

Tincture, tablets and one-third strength capsules will be similarly labeled.

or full information write for copy of the regard of the Smith booklet—"New Thoughts acture the hygiene of pare 170, nent of pregnancy, eaches the proper care of these three production.

(Continued from page 1519-adv. xi)

Presbyterian Church. Following the invocation and while the audience remained standing, Dr. George C. Yeager, chairman of the Committee

on Necrology, submitted its report.

"The scientific exhibit, consisting of fourteen booths, was unusually attractive, some of the exhibits being continuously crowded. The motion picture demonstrations increase in value each year. The fifty-four technical exhibits were of the usual standard and brought the very latest to those in attendance. We continue to be proud of these features, and the interest shown by the exhibitors.

"The entertainment was of high grade and greatly appreciated. The dinner-smoker was largely attended, about 800 being present. The serving of the dinner was a noteworthy achievement from the catering standpoint alone. The principal speaker was Mr. Charles M. Schwab, a resident of Cambria County, chairman of the board of the Bethlehem Steel Corporation.

"The big social event of the session was the president's reception which was held at the Sunnehanna Country Club. Dancing was keenly enjoyed until the wee sma' hours of the morning. A delightful innovation this year was the arrangement whereby those who did not care to

dance could play cards.

"The Public Meeting, one of the outstanding events, was addressed by Dr. J. Allen Jackson, Danville, on 'The Role of Mental Hygiene in the Prevention of Mental Disease.' A very pleasant musical entertainment was featured. This event was unusually well attended, showing what can be accomplished, when the local committee in

charge is efficiently functioning.

"The annual golf game was more attractive than ever. Divots winged their trajectories, and 'Fore' was the battle cry. The golf tournament always precedes the regular session, and is a valuable ally in attracting members to the meeting. There were 83 members in competition on the links of the Sunnehanna Country Club. Nine prizes were awarded the winners of the various events. A banquet was held at which 132 were present.

"The trap shoot was held on the Johnstown-Windber Gun Club range in Geistown. Dr. L. C. Irwin, of Kittanning, was high gun, with a score of 99.

"A very attractive feature of our annual session is the medical alumni reunions. This year the following participated: University of Pennsylvania, Jefferson Medical College, University of Maryland, Medico-Chirurgical College, University of Pittsburgh, and Temple University.

"The Wome Auxiliary had a spirited, colorful, and em satisfactory meeting. The numended for the very devided. The registration

## When pneumonia is on the war path

Alka-Zane is a granular, effervescent salt of calcium, magnesium, sodium and potassium carbonates, citrates and phosphates. Dose, one teaspoonful in a glass of cold water.

CIDOSIS is its ally. In infectious diseases the tendency toward acidosis is now a widely accepted fact. And treatment has a far more difficult job ahead.

The remedy is simple. Alka-Zane will replenish and support the depleted alkali reserve. Alka-Zane may be dissolved in water and, if desired, added to milk or fruit juices to form a zestful, refreshing drink.

Final decision on the true worth of Alka-Zane rests with the physician. We will gladly send a twin package, with literature, for trial.

# PHYSICIANS AND PUBLIC HEALTH IN SOUTH CAROLINA

The South Carolina Medical Association is the Board of Health of the State; and it naturally follows that the County Medical Societies also have public health functions. This subject is discussed editorally in the October Journal of the South Carolina Medical Association as follows:

"Naturally there has arisen some confusion about the action taken at the Florence meeting with reference to the part the County Medical Society is to play in the supervision of public health activities in each county in the state. It was recommended that every county medical society appoint at once a public health committee, this committee being charged with cooperative and supervisory powers with reference to all public health matters in the county.

"We believe the House of Delegates did not intend to cripple in the slightest degree legitimate public health work but to bring about a closer cooperation on the part of the medical profession with public health agencies. In no other way will the South Carolina Medical Association ever completely fulfill its destiny as proclaimed in the organic public health law of the state to the effect that, the South Carolina Medical Association is the State Board of Health. The intent of this law is to the effect that every member of the State Association is duty bound to take an interest in preventive medicine in his community and in his private practice.

"The Anderson County Society attempts to

# DEWCYDEW-TONE and PORT

SOME time ago we attempted to introduce Dewey's Dew-Tone and Port to you. Have you tried it? We feel so certain of its effectiveness that we know a trial will mean its continued use. We want to assure you again of its medicinal value and absolute purity.

Dew-Tone and Port is particularly helpful to patients suffering from chlorisis or anemia. Especially, those forms of anemia associated with convalescence or senility, where iron deficiency is a recognized paramount etiological factor.

The iron is furnished by wine secured from properly matured grapes grown in soil which is known to produce grapes of maximum iron content. The body is capable of absorbing this natural iron in large quantities because it approximates similar chemical structure in the human organism.

To augment these natural aids we have added peptones and both calcium and sodium glycerophosphates. These salts supply deficient calcium and phosphorous, thus stimulating a return to normal metabolic processes and assuring adequate nutrition to the nervous system.

With this scientific combination of ingredients we have an active tonic, pleasant and palatable, which stimulates the digestive system, increases gastric secretion and supplies body deficiencies until the organism has returned to normal functioning.

Dew-tone and Port is only sold direct to you or your patients

# for ARTERIOSCLEROSIS -ANGINA PECTORIS

N cardiovascular disease, such as angina pectoris and arteriosclerosis, a spasmodic condition of the arteries is frequently responsible for acute distress and discomfort as well as high blood pressure.

In these cases the administration of Theominal has been found to afford marked and often continued relief. Both of its constituents (Luminal and theobromine) cooperate in reducing vascular spasm, increasing coronary blood flow and lowering high blood pressure.

#### ANGINA PECTORIS

"Theominal has an excellent antispasmodic and sedative action in angina pectoris and conditions of restlessness of arteriosclerotic origin. In severe cases its use often makes it possible to dispense with opiates. It is nontoxic and well tolerated during prolonged administration. Its efficiency is evidenced by abatement or arrest of anginal attacks."

### **ARTERIOSCLEROSIS**

"Summarizing my observations I can state that the administration of one tablet of Theominal, three times daily, is sufficient to demonstrate its sedative and hypotensive effect within a period of eight days. As a rule, after two days, subjective improvement occurred, with rapid subsidence of restlessness in cardiac patients as well as tachycardia."

#### HYPERTENSION

"In eight of ten cases of high blood pressure Theominal produced striking improvement during the period of treatment. The effect was transitory in one case and negative in the other. In almost all instances a constant reduction of blood pressure ensued, varying between 25 and 70 mm. Hg.; once even up to 110 mm. transiently."

DOSE: One tablet two or three times daily.

Nervous Dyspepsia
Gastric Pain
Acid Urine
Acidosis
Vomiting in Pregnancy
Sea Sickness
After Anesthesia

The pleasantly effective antacid, BiSoDoL, not only controls hyperacidity quickly but in so doing it allays pain and irritation to the sensitive mucous membrane of the stomach.

BiSoDol offers a balanced formula in which the effect of the sodium and magnesium bases is enhanced by the mechanical protective effect of the bismuth content on mucous membranes.

Where systemic alkalization is indicated, as in the treatment of cyclic vomiting, the morning sickness of pregnancy, the common cold and respiratory affections in general, etc., BiSoDoL offers distinct advantages over the usual forms of alkali treatment.

We would like you to try BiSoDoL for yourself. Let us send you literature and clinical sample of this ethically presented prescription product.

#### MEDICAL AND SURGICAL ASPECTS OF ACUTE BACTERIAL INFECTIONS

PAPERS PRESENTED DURING THE THIRD GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE, ABSTRACTED BY FREDERICK P. REYNOLDS, M.D., MEDICAL SECRETARY, COMMITTEE ON MEDICAL EDUCATION

THE Third Graduate Fortnight of the New York Academy of Medicine which was held October 20th to 31st, attracted large audiences both for the evening meetings and for the coordinated afternoon clinics which were held in twelve hospitals of the city.

Physicians came from all parts of the United States to attend the sessions. Applications for clinic tickets were received from physicians in 22 States and from 4 Provinces in Canada.

The speakers on the programs of the evening meetings were men of established standing in their special lines of work and in their papers presented viewpoints of the general subject of the Fortnight from many different angles.

The papers of the Fortnight will be printed in full in the monthly Bulletin of the Academy. Abstracts of some of the papers are presented herewith.

#### DR. C. F. MARTIN

The introductory address inaugurating the Fortnight was delivered by Dr. C. F. Martin, Dean of the Medical Faculty, McGill University, Montreal, on the subject of "Medical Education and Medical Practice." After his preliminary remarks Dr. Martin discussed medical education in its many aspects and compared the systems in vogue in foreign countries with those in America. In particular he pleaded for a broad general education as the basis for a medical career. In regard to the continued education of the practitioner he said:

"But, you will ask, what about the continued education of the practitioner, which, after all, was to have been the main theme of my message. I have already explained in extenuation of this long dissertation that one cannot well dissever graduate teaching from the antecedent training. According to his special preliminary advantages of birth, training and opportunities, so will the graduate be guided in his later career.

"Modern medicine has been demanding more and more access to laboratories and hospitals, which is essential to the growth and maintenance of professional power. The great majority of physicians, however, have had too little contact with these agencies, and relatively few take full advantage of the opportunity.

"Continuation courses for practitioners represent a need in medical education worthy of very careful consideration. The clinical resources of a great city in a university setting alone offers an opportunity for the organization of graduate teaching. The success, however, depends as much on the segregation of the graduate students as it does upon the teacher.

"Mass training in post-graduate work in detail is certainly not feasible, though much may be done to large groups to maintain their interest, to instruct and to entertain, and this can be done by lectures, clinics and demonstrations.

"And what may one say for the continued education of the older practitioner—for him who absorbed in years of general practice has been allowed too little leisure for keeping abreast of medical progress—the pilgrim, who has awakened to a desire to change for a brief period, the depressing atmosphere of the Valley of Humiliation for the stimulating triumphs of the Delectable Mountain of Knowledge? The answer is not so easy. Medical science has become so vast, so dependent on the biological sciences, so highly specialized in every direction—the individual spheres of knowledge have become so interdependent, that a choice is difficult for him who

seeks to gain a refreshment where progress has

been so appallingly rapid.

"Apart from the opportunities of wards and dispensaries, he will be confronted with the choice of study in laboratory technique, in highly specialized courses in serology, radiology or any of the similar advanced subjects of post-graduate study.

"In his effort, for example, to study focal sources of infection he may learn to differentiate a normal from an abnormal dental condition, mere absorption from focal abscess of the teeth. He may even transilluminate, with some degree of skill, the sinus cavities, or detect an abnormal shadow in the actinogram. If more ambitious and lucky in his technique, he may acquire some dexterity in the newer methods of examination of the gall bladder, and even study the pyelograms of the normal and abnormal kidney, and he may familiarize himself with the diagnostic study of cerebrospinal fluids, or learn bacteriologically the various types of pneumonia.

"In such short courses, however, without the preliminary and more prolonged fundamental

training he will not only fall short in manipulative skill but fail to appreciate the relative values of what he learns to see. Without experience and judgment he cannot expect to go very far, and there is no short cut to such an achievement.

"There pours into these graduate, or refresher, courses, as they are called, a number of men, each with individual ambitions and ideals, and each with a different zeal for knowledge. Each is staggered at the choice, uncertain how best to use his time. The danger lies in wanting to learn too much, in wanting to taste too many of the intellectual savouries of the banquet. He is apt to do as so many have done before him in Vienna and avail himself of so many courses that, at the end of his short weeks of study, he suffers from intellectual indigestion. Far better would it be for such a one to curb his ambitions, confine himself to the reasonable, restrict his interests to a limited sphere and by attaching himself to one service, or one teacher, whom he respects, and allow his mind to gain inspiration, knowledge, and a degree of judicial discrimination."

#### DR. FRANK BILLINGS

Dr. Frank Billings, Professor Emeritus of Medicine of the University of Chicago, presented the first scientific paper on the subject of "Focal Infection As a Cause of General Disease." He discussed the subject from many angles. In particular he discussed the modes of transmission of bacteria and toxins from the foci of infection. Unfortunately in an abstract it is impracticable to cover this part of the paper.

"Focal infection as an etiologic factor of general diseases is now an established pathological

principle.

"During the last twenty years an enormous literature on the subject has accumulated. As this literature is available, this address will deal chiefly with the important principles of focal infection.

"A few general diseases only caused by focal infection will be cited; but sufficient in number to illustrate the principles discussed.

Site of Primary and Secondary Foci of Infection

"The most common site of a primary focus of infection is about the head, including the teeth and jaws, the faucial tonsils, the lymphoid tissue of the nasopharynx, the accessory nasal sinuses, the mucosa of the upper nasal cavities, the middle ear and mastoid cells. Less frequently primary foci are located in the skin including pyogenic infection of finger and toenails; in the bronchi as bronchi-ectatic cavities; ulcers acute or chronic in the intestinal tract and rectum including infected hemorrhoids; in the genito-urinary tract, fallopian tubes, venous sinuses of the uterus, semi-

foci of infection occur in the lymph

vessels and nodes, especially of the neck and mediastinum and mesentery. In the gallbladder and appendix vermeformis as chronic infection. In distal tissues anywhere in the body in the form of metastases.

# Character of the Infectious Micro-organisms of Foci of Infection

"The dominant infectious agents causing foci of infection are the streptococci; s. hemolyticus, s. viridans; staphylococci; s. albus, s. aureus; the tubercle bacillus; the gonococcus; the diphtheria bacillus; the colon bacillus when removed from its normal habitat and in mixed infection with other pathogenic bacteria.

The fallopian tubes are susceptible to infection with the gonococcus which may cause obliterating salpingitis or abscess and may cause peritonitis. Tuberculous salpingitis may lead to peritonitis or to tuberculous invasion elsewhere. The deep urethral tract, prostate gland and especially the seminal vesicles are frequently infected with the gonococcus, and sometimes as a mixed infection with streptococci. Gonococcus infection of the seminal vesicles may be acute or chronic and as a primary focus of infection may lead to arthritis acute or chronic, gonorrheal bacteriemia and ulcerative endocarditis.

"The skin and its appendages may be the site of foci of infection in the form of furuncles, abscesses about the finger and toenails, blisters and abrasions infected with the ever present staphylococcus on the skin and sometimes by streptococci.

Susceptibility to General and Also to Local Disease from the Focus of Infection

"The incidence of general and local disease from the focus of infection is notably small in comparison with the incidence of primary and secondary foci of infection. The marked prevalence of infection of the jaws and teeth is not associated with the frequent incidence of acute or general disease. The incidence of chronic gonerheal infection of the deep urethra, prostate gland and seminal vesicles is very great as compared with the occurrence of gonorrheal arthritis tenosynovitis, gonococcenia and ulcerative endocarditis.

The relatively rare incidence of systemic disease as compared with the marked prevalence of foci of infection may be explained by well known facts of immunity both natural and ac-The natural defenses of the body due to the bactericidal and antitoxic powers of the tissues, blood plasma and cells, especially the phagocytes protect us from infectious diseases both acute and chronic Turthermore, when the animal body is invaded with pathogenic bacteria the natural defenses are increased by their pres ence in the tissues and blood. Similar stimulation of the formation of protective antibodies may be induced in the host by the injection of nonlethal amounts of living bacteria or of dead pathogenic agents

"Bacteria may diminish in virulency and path ogenicity and exist as harmless parasites of the skin, mucous membrane and probably also in the existing foci of the tissues

"The immunity to infection from foci of infec tion to general and local disease may be partly or wholly broken down by the same causes noted in the discussion of the susceptibility to foci of infection Exhaustion and debility from physical and mental overwork, starvation, chronic noninfectious general disease and exposure to wet and cold are important factors in the increased susceptibility to acute and chronic general disease from focal infection. It is also to be noted that poor body mechanics including faulty posture defective functions of the respiratory organs diminished blood pressure with poor circulation defective general nutrition and other factors in crease the susceptibility to systemic infection from a focal infection especially in the so called chronic rheumatic disorders

Examples of Chronic General and Local Disease Due to Primary and Secondary Foci of Infection Chronic Cholecystitis

"Chronic cholecystitis, with or without gall stones, is as a rule the result of acute infection of hemitogenous origin

"Chronic infectious cholecystitis is of importance because of the discomfort it may cause and its interference with the function of digestion It is quite as important as a secondary focus of infection causing general disease. This infection may lead to biliary cholingitis evidenced by the long known entity hepatic intermittent fever, to degenerative changes in the heart muscle and kidness, to types of perincuritis and other conditions. The surgical cradication of the infection is usually followed rapidly by the disappearance of the intermittent fever the restoration of the heart muscle tone, a disappearance of the evidences of kidney degeneration and relief from the uncomfortable lameness due to perincuritis.

#### Chronic Infectious Arthritis

'Chronic arthritis is classified as an atrophic form and as a hypertrophic type. Chronic arthritis is widely disemminited, the atrophic type occurring in the young to middle age and the hypertrophic type in those beyond middle age. It is important because of its crippling results and discomforts and also because of the great economic loss which it entuins.

"After long study the American Committee for the Control of Rheumatism, its members composed of elimicians and investigators whom we all respect has issued an opinion concerning the disease commonly known as chronic rheumatism or chronic arthritis. The Committee is of the opinion that hypertrophic arthritis is not of in fectious origin, but that atrophic arthritis is an infectious type of the disease. The opinion is given that no one strain of the streptococcus or of other bacteria has been discovered as a specific etiologic factor.

"This report of the Committee has been published in an essay by Osgood of Boston In the paper Osgood gives a clear, comprehensive and satisfactory description of hypertrophic arthritis and also of atrophic arthritis or chronic rheumatism, which I recommend should be read by all members of the profession interested in the sub-

"The members of the American Committee for the Control of Rheumatism individually and as a committee believe apparently that much of the morbid anatomy and resulting disfunction which occurs in the joints, muscles and tendons of atrophic arthratis, is due to the diminished blood circulation of the involved tissues. With this opinion I agree and direct attention to statements I have made in former publications and in this paper to the probability that hematogenous infection by bacterial emboli or their toxins is a large factor in the diminution of the blood circulation especially in the smaller blood vessels

"In the treatment of the condition it is interesting to note that at the Mayo Clinic lumbar sympathetectomy has restored a liberal blood circulation to the lower extremities of patients suffering with atrophic arthritis with phenomenal restoration of function of joints and muscles and great favorable changes in the morbid anatomy of the affected parts"

N. Y. State J. M. December 1, 1930

#### DR. F. d'HERELLE

Dr. F. d'Herelle, Professor of Bacteriology at the Yale University School of Medicine spoke on "Bacteriophage as a Treatment in Acute Medical and Surgical Infections." In his introductory remarks he said that bacteriophage therapy is still in its infancy and many studies are still necessary before we will learn all the results that we may anticipate, but what has already been done in many diseases justifies the belief that this is the specific treatment par excellence and that it will attain a wider and wider application.

"Let us consider a particular case,—that of the phenomenon of recovery from infectious disease. We know, through common experience, that certain species of animals are completely refractory to certain diseases which decimate other species. No one has ever seen, for example, in the course of the most terrible epidemic, a single rabbit contract cholera or a single guinea pig contract typhoid, although men were dying by thousands. The guinea pig and the rabbit, as indeed are all other animals, are refractory to these two diseases. They enjoy a natural immunity.

"We know, likewise, by common experience, that a great many of the infectious diseases do not recur or, at least, recur but rarely. It is unusual for a man who has recovered from an attack of typhoid, for example, to contract this disease a second time. A first attack of an immunizing disease leads, therefore, within the individual, to the appearance of a new character. He enjoys an acquired immunity. This immunity, very strong at the beginning, gradually diminishes at a rate more or less rapid in accordance with the disease causing it. In certain cases it disappears completely after a greater or less length of time.

"There is, in addition, a third type of immunity. In certain of the chronic diseases such as tuberculosis or syphilis it is very evident that the patient does not enjoy an acquired immunity since the pathogenic organisms continue to develop within the lesions, but he possesses, nevertheless, a new character, for reinfection cannot occur as long as he remains the carrier of the specific germs. This immunity certainly different from acquired immunity since it ceases at the moment when the specific organism disappears from the lesion, may be termed pathogenic immunity or, better, symbiotic immunity.

"It is only natural a priori to consider the phenomenon of recovery as being within the limits of immunity, but this has yet to be experimentally proved. It is somewhat curious to note that this question of recovery in infectious diseases, a question which would seem fundamental, has always been passed over in silence. Everyone has implicity admitted that recovery was a natural consequence of the acquisition of immunity. The reason for this conclusion can readily be understood for all present day immunology is founded

upon laboratory experiments carried out with guinea pigs and with rabbits. These animals have been inoculated with cultures of different bacteria, cholera vibrios, typhoid bacilli and others for which these animals possess an absolute natural resistance. In them there has been produced artificial infections which bear no relationship with natural diseases. It is in this way that nature has been disobeyed, for such studies can only lead to an imaginary solution. Today immunology is but a pseudo experimental science.

"From the beginning of my study of bacteriophagy I have been struck by the fact that the appearance within the body of the patient of the principle which leads to bacteriophagy coincides with the time when the symptoms ameliorate. Absent during the disease, bacteriophage appears constantly in convalescents. Bacteriophagy is thus contemporaneous with recovery.

"Various questions now arise. Is this bacteriophage found only by chance in the intestinal tract of certain dysentery patients, or is it a constant phenomenon? We will return to this question later. Is the phenomenon of bacteriophagy limited to the dysentery bacillus? I have been able to establish the fact that bacteriophagy is a general phenomenon."

He enumerated various disorders in which he had found it possible to isolate races of bacteriophage leading to the dissolution of bacteria.

"The diversity of the bacteria attacked warrants the belief that the phenomenon is, indeed, general, perhaps involving all bacteria.

"For lack of time I will not discuss all of the characteristics of the bacteriophage phenomenon for it is in reality extremely complex. I will restrict myself to some of the essential ideas. The bacteriophage corpuscle is a living, ultramicroscopic being as is proved by the fact that this corpuscle dissolves bacteria through the agency of a ferment which it secretes. The secretion of a ferment implies a metabolism and this is an essential character of living beings. A bacteriophage is, therefore, of necessity a virus, a parasite of bacteria.

"In its action each bacteriophage is not specific, for a given bacteriophage may parasitize and dissolve bacteria belonging to different species, sometimes as unrelated as the streptococcus and the colon bacillus or even the plague bacillus and B. typhosus. The characters of each strain of bacteriophage are variable. There are races of bacteriophage able to attack many species of bacteria, others which attack but a single species or even but a single bacterial strain. Certain of them are so potent that they are able in vitro to destroy and to dissolve within less than two hours all of the bacteria contained in a culture, while others exercise but a scarcely perceptible, partial action.

"Adaptability is an exclusive property of living

beings and the bacteriophage possesses this character to a very high degree. There are, however, in this respect differences between different races for certain bacteriophages adapt themselves very readily, while others do so very slowly. In so far as the present discussion is concerned, the most important character of adaptability is represented by the faculty which each strain of bacteriophage possesses of adapting itself to the parasitism of new bacterial species which hereto-fore were not attacked. This experiment of fore were not attacked. adaptation can even be effected in vitro. possible, for example, to adapt a bacteriophage which originally, at the time of isolation, was active only upon B. coli to the parasitism of This property of adaptation is B. typhosus. rapidly lost in races of bacteriophage maintained under laboratory conditions.

"In order to prove if the bacteriophage is really the cause of a recovery it is only necessary to study patients affected with acute infectious diseases from the beginning of the disease up until the end of convalescence. This is what I have done for various human and animal diseases. Here is, in summary, what I have observed. The condition of the patient depends upon the behavior of the bacteriophage and recovery takes place only when the destroying potency of the bacteriophage reaches an intensity sufficient to lead to the bacteriophagy of the

pathogenic bacteria.

"I will state briefly what has been done up to the present time in this direction. From 1919 on I have made experiments upon patients affected with bacillary dysentery, causing each patient to ingest two cubic centimeters of a culture of bacteriophage having a high virulence for dysentery bacilli. In all cases, without exception, all of the morbid symptoms disappeared within a few hours, in from four to twenty according to the case, and the next day the patient was definitely convalescent. Since that time this method of treatment has been applied on a large scale, principally in the Soudan and in Brazil.

"In Brazil, as the result of control experiments conducted by da Costa Cruz, who obtained results identical with those which I had reported, the Oswalde Cruz Institute of the Brazilian Government has prepared, since 1924, cultures of a highly virulent bacteriophage for the dysentery bacilli. These have been placed into two cubic centimeter ampules and distributed to hospitals, to government health officers, and to all physicians who have requested them. This mode of treatment has quickly supplanted all others, including the use of antidysenteric serum, which has been abandoned. The results obtained in the first 10,000 cases have been published and only two failures are recorded.

"As for the Soudan, this phrase, summarizing the results, appears in a letter of the Director of the Medical Service. The results of treatment of bacillary dysentery with it have been little short of miraculous. A single failure, the case of an infant already moribund when brought into the hospital, occurred among several hundred cases treated.

"In the year 1927 while in India, as the result of the experiments of which I have spoken, I attempted the treatment of Asiatic cholera. These attempts at therapy were made in the Punjab, on the natives cared for in their homes and to whom no other medication was given. Each patient received an initial dose of two cubic centimeters of a virulent bacteriophage, and with the family a second dose of four cubic centimeters diluted in one hundred cubic centimeters of water was left with instructions to give it to the patient by spoonfuls during the three or four hours following. I should state that I merely furnished the cultures of bacteriophage; treatment was carried out by Major Malone of the Indian Medical Service, assisted by the other officers of the Service. As it was impossible to enforce any one mode of treatment, the family of the patient was free to accept or refuse it; in the latter case usually resorting to the prescription of the Hin-doo medicine man. The majority of the patients for whom authorization was granted were found in a critical state; indeed, it was only because of this that parents, despairing of saving them, accepted the new treatment. As a control series we have taken those cases in which the bacteriophage treatment was refused. In spite of these extremely unfavorable conditions the mortality in the controls was 62.9 per cent, and among those treated with bacteriophage 8.1 per cent.

"In 1926 while in Egypt I treated four cases of bubonic plague injecting the bacteriophage into the buboes; all four of the patients recovered.

"Let us state in passing that the antitoxic action manifested so quickly and effectively by the bacteriophage is absolutely clear cut, although it is difficult to explain in the present state of our knowledge. I have observed it not only in plague but in other toxic diseases which I have treated with bacteriophage, cholera and bacillary dysentery among others.

"One other type of infection should be mentioned briefly, that is, the treatment of chronic bronchitis, of angina, and of coryza by means of a mixture of different races of bacteriophage active for those organisms which may be isolated from the throat in these conditions.

"Treatment by bacteriophage has been, I believe, demonstrated to be the specific treatment ar excellence, since it leads to recovery through a mechanism identical with that of natural recovery. Because of its nature one may hope to obtain results only when the bacteriophage administered is endowed with a maximum potency against the pathogenic organism involved.

# DR..FENWICK BEEKMAN

Development of more satisfactory methods of treating cases of inflammation of the bone-marrow arising from infections in the blood is bringing encouraging results in this serious disease of childhood, and successful treatment lies in early recognition of the conditions, followed by immediate operation, said *Dr. Fenwick Beekman*, attending surgeon at Bellevue Hospital. Dr. Beekman's subject was "Acute Hematogenous Osteomyelitis."

"Though the outlook, in many cases, is poor, a larger number of favorable results are now obtained than were formerly, due to the more rational treatment which has been developed. Because of this, less lives are lost, there is a decreasing number of patients with recurring attacks and there are fewer individuals with permanent disabilities.

"The intelligent treatment of an infection of a bone is dependent upon a knowledge of the pathological changes which may occur during the disease. To obtain the best results, the treatment must be applied at the earliest possible period in the course of the disease. The surgeon is often unduly criticized for a poor result when he is not to blame, as his care of the patient did not commence until the osteomyelitis had developed intoan advanced stage. Consequently, early recognition of the condition is essential; this most frequently lies in the hands of the pediatrician or general practitioner. The local symptoms by which the diagnosis is reached can only be understood through a study of the pathological changes in the bone, as the diagnosis at this stage of the disease is dependent upon the presence of but a few signs.

"The disease varies in its intensity from a mild type of case with a well localized focus, to one in which there is a general blood infection accompanied by symptoms which overshadow in intensity those of the local bony lesion. In this latter type of case, there is a general sepsis and from the blood of these patients, the infecting micro-organism can usually be recovered by culture.

"It is well known that the disease is peculiarly confined to that period of life in which the bones of the body are undergoing their growth and that the lesion usually occurs in that part of the bone which is actively engaged in the production of growth. Though children between the sixth and thirteenth year of life are most often affected, it is not uncommon to discover the disease in younger or older individuals.

"Trauma or injury is probably the predisposing element which determines the position of the bony lesion. Some accident, producing a slight injury to the bone, precedes the onset of the disease in at least sixty per cent of the cases. The trauma is apparently of a type that causes a twisting motion to the bone.

"The outlook in cases of the disease is dependent upon several factors, the most important of which is the nature of the beginning of the disease. Death occurring in the course of an attack is usually due to the blood infection and often occurs during the first ten days of the disease. The deaths which take place later, may be due to secondary septic lesions. Many patients, with a certain type, succumb to the blood infection before the local bony lesion has fully established itself. There are other cases in which the bacteria remain in the blood for some days. This is a sign of danger; however, children with this condition recover.

"The symptoms that are present, in an individual case, of acute hematogenous osteomyelitis. may be entirely due to the local lesion or partly the result of a general blood infection. Consequently, they differ in quality and also vary in intensity.

"The symptoms of a patient in which the bone lesion is well localized, are those due to the reaction of the tissues in the region of the focus with accompanying constitutional symptoms due to the toxemia, but these latter are often mild and occasionally entirely lacking. The character of the lesion in the mild type of case may not be suspected for some time, for the focus which is localized within the bone, displays signs that are not pronounced and these may be misinterpreted.

"Acute osteomyelitis is most often mistaken for acute rheumatic fever. This is probably due, in a great many cases, to the lack of a complete physical examination, which would have revealed the bony tenderness, rather than to the misinterpretation of the symptoms. Infantile scurvy has been mistaken for the mild type of osteomyelitis and is a possibility to be considered.

"Emphasis should be laid upon the fact that the x-ray is of little positive diagnostic value during the early stage of an attack of acute hematogenous osteomyelitis.

"An individual suffering from the disease should be considered as an emergency case and immediately operated upon.

"Since adopting these more conservative methods of dealing with acute hematogenous osteomyelitis, there has been a reduction of the mortality and an improvement in the morbidity in the cases treated by the Children's Surgical Service of Bellevue Hospital. There have been fewer complications and disabling deformities, consequently, the period of hospitalization, in the individual case, has been shortened."

#### DR JOHN EDMUND MACKENTY

Dr John Edmund Mackenty, Senior Surgeon of the Manhattan Eye, Ear and Throat Hospital, New York discussed 'Infections Arising from Tonsils and Smuses"

Emphasizing the importance of acute bacterial infections he said

"Added research will, no doubt, show us that focal infection is not in itself a complete entity but only the forefront of a vast unexplored back ground in which he concealed and undeciphered the intricate problems of immunity and biologic chemistry It is in this hinterland that we must search for the true primary causes of disease In other words, the infections we now see and experience are but the seeds, the background of which we know little or nothing is the soil

"For centuries prior to Pasteur the science of medicine was a compassless ship, captained it is true by many a good, intrepid and ingenious mariner The great genius of Pasteur has given it direction Now we have many charts to fur ther our explorations into new worlds. Among these, and not the least of them, is the domain of focal infection

"It is not an exaggeration to state that focal infection is assuming an ever increasing role of importance in the medical mind and practice and that the majority of focal infections are located in the para nasal sinuses, the tonsils and the teeth

"Time was, and that in my memory as an ac tive worker in the profession, when only a few advanced thinkers and experimenters were grop ing towards the truths now established, visualizing a more simple and logical explanation of the then disconnected phenomena of focal infection diseases

"The workers in the field of diseases of the head and throat of thirty years ago were few, compared with now, and their standing in the profession at large not enviable They were in a way the pariahs of the body medical, the small brothers of the big surgeons Little did they dream then of the fertility of the unexplored domain they had inherited. That here above the shoulders of man was the roosting place of a thousand evils for him but few suspected how changed the picture! Barren no more, but holding in its rapidly enlarging confines the causes of a goodly percentage of human alls

"I have irrefutable evidence of the malign influence of diseases of the sinuses, the tonsils, the teeth and the ear upon the body even in its remotest parts

"Beginning often in early childhood the maligit and insidious trail of chronic tonsillar and sinus disease may be traced through the lives of their victims Lowered efficiency, moral and physical degeneracy, chronic invalidism, and even an untimely end are too often the results sociological standpoint the loss is incalculable

"In this almost unexplored domain of im munity a brilliant and disease conquering future awaits the young men in our profession advisedly young men since, in the shadow of advancing years, we older ones, though filled with ideas born of experience and though alluting roads to higher and more accurate knowledge may beckon to us, yet we hesitate to advance and can do no more than point the way In retrospect we see how often fruitless have been our long journeyings in the search of truth. Time enough, or courage or strength enough to blaze new trails are denied most of us and we fain would shift the burden to vounger shoulders

"This all important factor of immunity is too often disregarded in our blind confidence in sur gery to stay the ravages of chronic sinus discase In selected cases surgery does accomplish mir acles, but there remains a great number in which mechanical intervention does great harm is reflected in the fear many patients evince at the mention of sinus surgery. So many of their acquaintances have been made worse by it doubt if the profession in general realizes the widespread extent of this disease. Looking out through the narrow peep hole of specialism it would seem to me to affect one-quarter or more of the human family

"Heredity, I believe, is a factor in sinus dis In hundreds of instances I have observed sinusitis in every member of the family and oc casionally in every member of two generations In later life influenza is the most potent factor

"I have considerable proof, in my own records, to offer in support of my contention that sinusitis

and arthritis are closely associated

"The gastro intestinal tract from end to end may feel the effects of a long continued sinus and tonsil infection, both directly from the infected material swallowed and indirectly through the blood stream

"In recent years the lung specialists are recognizing the intimate connection between lung con ditions and sinus diseases with a resultant re classification of lung pathology on a causative basis "

In discussing the role of diseased tousils and treatment of them, Dr Mackenty emphasized the importance, in cases of operations, of removing every last vestige of the diseased organs to guard against recurrence of trouble. He added

"Ionsillar infection is often the cause of This relationship is so inchronic sinus disease timate that little help for chronic sinusitis is to be expected if the offending tonsils are allowed

#### DR. FENWICK BEEKMAN

Development of more satisfactory methods of treating cases of inflammation of the bone-marrow arising from infections in the blood is bringing encouraging results in this serious disease of childhood, and successful treatment lies in early recognition of the conditions, followed by immediate operation, said *Dr. Fenwick Beckman*, attending surgeon at Bellevue Hospital. Dr. Beekman's subject was "Acute Hematogenous Osteomyelitis."

"Though the outlook, in many cases, is poor, a larger number of favorable results are now obtained than were formerly, due to the more rational treatment which has been developed. Because of this, less lives are lost, there is a decreasing number of patients with recurring attacks and there are fewer individuals with permanent disabilities.

"The intelligent treatment of an infection of a bone is dependent upon a knowledge of the pathological changes which may occur during the disease. To obtain the best results, the treatment must be applied at the earliest possible period in the course of the disease. The surgeon is often unduly criticized for a poor result when he is not to blame, as his care of the patient did not commence until the osteomyelitis had developed into an advanced stage. Consequently, early recognition of the condition is essential; this most frequently lies in the hands of the pediatrician or general practitioner. The local symptoms by which the diagnosis is reached can only be understood through a study of the pathological changes in the bone, as the diagnosis at this stage of the disease is dependent upon the presence of but a few signs.

"The disease varies in its intensity from a mild type of case with a well localized focus, to one in which there is a general blood infection accompanied by symptoms which overshadow in intensity those of the local bony lesion. In this latter type of case, there is a general sepsis and from the blood of these patients, the infecting micro-organism can usually be recovered by culture.

"It is well known that the disease is peculiarly confined to that period of life in which the bones of the body are undergoing their growth and that the lesion usually occurs in that part of the bone which is actively engaged in the production of growth. Though children between the sixth and thirteenth year of life are most often affected, it is not uncommon to discover the disease in younger or older individuals.

"Trauma or injury is probably the predisposing element which determines the position of the bony lesion. Some accident, producing a slight injury to the bone, precedes the onset of the disease in

at least sixty per cent of the cases. The trauma is apparently of a type that causes a twisting motion to the bone.

"The outlook in cases of the disease is dependent upon several factors, the most important of which is the nature of the beginning of the disease. Death occurring in the course of an attack is usually due to the blood infection and often occurs during the first ten days of the disease. The deaths which take place later, may be due to secondary septic lesions. Many patients, with a certain type, succumb to the blood infection before the local bony lesion has fully established itself. There are other cases in which the bacteria remain in the blood for some days. This is a sign of danger; however, children with this condition recover.

"The symptoms that are present, in an individual case, of acute hematogenous osteomyelitis, may be entirely due to the local lesion or partly the result of a general blood infection. Consequently, they differ in quality and also vary in intensity.

"The symptoms of a patient in which the bone lesion is well localized, are those due to the reaction of the tissues in the region of the focus with accompanying constitutional symptoms due to the toxemia, but these latter are often mild and occasionally entirely lacking. The character of the lesion in the mild type of case may not be suspected for some time, for the focus which is localized within the bone, displays signs that are not pronounced and these may be misinterpreted.

"Acute osteomyelitis is most often mistaken for acute rheumatic fever. This is probably due, in a great many cases, to the lack of a complete physical examination, which would have revealed the bony tenderness, rather than to the misinterpretation of the symptoms. Infantile scurvy has been mistaken for the mild type of osteomyelitis and is a possibility to be considered.

"Emphasis should be laid upon the fact that the x-ray is of little positive diagnostic value during the early stage of an attack of acute hematogenous osteomyelitis.

"An individual suffering from the disease should be considered as an emergency case and immediately operated upon.

"Since adopting these more conservative methods of dealing with acute hematogenous osteomyelitis, there has been a reduction of the mortality and an improvement in the morbidity in the cases treated by the Children's Surgical Service of Bellevue Hospital. There have been fewer complications and disabling deformities, consequently, the period of hospitalization, in the individual case, has been shortened."

The preparation of the patient for spinal anesthesia comprehends plenty of fluids, an enema, and five grains of veronal in a glass of hot milk the night before the operation, five grains of caffeme sodium benzoate one hour before the patient is taken to the operating room and one sixth of morphine with one-three hundredth of scopo laine one half hour before the operation spinal injection is given on the operating table The skin with the prtient in a sitting posture having been sterilized and the patient placed in the proper position an ampule containing 1 cc of a five per cent solution of ephedrine and one per cent of novocame is injected over the site of the puncture, the second or third lumbar inter-The ephedrine takes care of the tendency to a fall in blood pressure. As soon as the spinocame is injected the patient is put in the horizontal position and the head of the table lowered and kept at an angle of from five to twenty degrees, according to the operation to be done. For the lower extremities and perineum a Trendelenburg position of from fifteen to twenty degrees should be used A ten to fifteen degree tilt will keep the anesthetic below the umbilicus while a flat table of a five degree Trendelenburg-will permit the anesthesia to ascend to the margin of the ribs. The Trendelenburg position should be muintained two or three hours after the operation

With two exceptions our experience with spinal anesthesia was very satisfactory. Any anesthetic which permits the surgeon to form a major oper ation without pain while the patient is conscious and able to talk or smoke or otherwise amuse himself is certainly very tempting to the surgeon and to many patients.

We had one patient who had a severe abdomi nal operation under spinal who said that he not only had no pain during the operation but that he never felt any pain during his convalescence Of the cases of spinal only three were nauseated Four patients were very nervous during the oper ation but suffered no pain. Post operative pain in the head and back was complained of in two cases and the spinal had to be supplemented with ether in two instances The blood pressure was taken before and after the operations and a fall of ten points was the greatest change noted. One patient developed pulmonary edema and the oper ation had to be abundoned. Subsequent history pointed to a previous pulmonary tuberculosis One patient died on the table. She complained of being uncomfortable and the head of the table was madvertently raised

Deaths have and will occur under any anes Sudden deaths occur without anesthetics It is related that when Simpson the discoverer of chloroform, was about to try it on a human being for the first time, the flask containing the precious fluid was dropped and broken on its way to the operating room. As there was no more to be had, the operation was of necessity performed without anesthesia. When the first in cision was made the patient died of syncope Simpson in recounting the story said "Chloroform has just had a beautiful escape" It is probable that many patients have died on the operating table when death was not due to the anesthetic and it is also probable that many patients have died after having been removed to their rooms as a result of the anesthetic

Spinal anesthesia would seem especially adapted for cases of intestinal obstruction, for the same degree of relixation cannot be obtained and maintained without very deep etherization which carries with it the well known predisposition to surgical shock, gastro-intestinal paralysis, lung complications and damage to the liver and kidneys. For the same reason it would seem to be the best anesthetic for prostatic operations for the arterial sclerosis of the aged is usually accompanied by nephritis which suffers less from spinal than from ether. It is also very useful in hone surgery. It is not suited for very nervous people or those who have any disease of the central nervous system or cases of septicema.

The seventy nine cases of rectal anesthesia ex-

tend back over a period of four and one-half months or since the fifteenth of May of this year. They are classified as follows:

35 males Sex: 44 females 8 between 1 and 10 years Ages: 13 between 10 and 20 years 15 between 20 and 30 years 18 between 30 and 40 years 15 between 40 and 50 years 4 between 50 and 60 years 2 between 60 and 70 years 3 between 70 and 80 years 1 between 80 and 90 years

## Classified as to diseases there were:

Of these seventy-nine patients, twenty-six or onethird needed no anesthetic besides the avertin, fifty-three required a supplementary anesthetic, varying in amount from two drams to five ounces of ether. The average amount of ether for the fifty-three patients requiring a supplementary anesthesia was one-half ounce.

The anesthetic used was avertin. It is a salt of brominetribromethanol, a white crystalline substance soluble in water at 104. As put up and sold by the Winthrop Chemical Company it comes in liquid form, dissolved in amylene hydrate, each c.c. containing 1 gm. of the drug, The dose is graduated according to the weight of the patient. 1/10 c.c. for every 2.2 pounds of the patient's weight. Thus if a patient weighs 22 pounds you would give 1 c.c. of the averting or if the patient weighs 220 pounds you would give 10 c.c. To the required dose of averting enough distilled water at a temperature of 104 is added to make a 2.5% solution. A convenient table which shows the number of c.c. of averting and water to be used in patients ranging in weight from twenty-two to two hundred twenty pounds is furnished with the avertin. After the water ted its purity is tested with a drop of congo red. It is then introduced into the patient's rectum by gravity, using a glass funnel with a rectal tube or male catheter, twenty minutes before the operation. The avertin should be administered while the patient is in bed in his room. The room should be darkened and quiet. It usually happens that the patient has no recollection of being placed on the stretcher or of the trip to the operating room. We had one patient operated for the radical cure of hernia who, upon being visited by relatives the next day, was asked how he felt. He replied, "All right. They have not operated on me yet and I don't know when they are going to." This patient was seventy-three years old and he took no ether.

The usual preparations, a cleansing enema and five grains of veronal, are given the night before the operation, the morphine and atrophin half an hour before the avertin is administered. As a rule the last thing the patient remembers is the enema. He does not remember being put on the stretcher, being taken to the operating room or the return trip. When the surgeon sponges off the site of the operation with alcohol or whatever antiseptic he uses, especially if it is an abdominal operation and there is any skin reflex, the patient will need a little ether. Out of the seventynine cases cited in this paper fifty-three took some ether and even if they all had had to have it, it seems to me to be much preferable to ether alone, for the reason that it takes so little.

Directly after I graduated from medical school I returned to my home in Lewiston, Maine. One morning I called on the family dentist to have a tooth filled. There was no one in the waiting room but I heard some one pounding in the workroom and I went in. The doctor was busy smoothing out a piece of sheet lead with a wooden mallet. I made known my errand and he said:

"Can't you come in next week. I am going on a fishing trip today and I was busy making some

I said, "All right," and started to go out when a big six foot French river driver came in, held up two fingers and pointed to the left side of his face which was badly swollen. He had come down the Androscoggin River with a drive of logs the day before and in the meantime had lapped up considerable liquor.

The doctor said to me, "Did you get your diploma?"

"Sure," I said.

"Then stay and give this log roller a little ether. It won't take long."

We got what we could of him in the dental The doctor examined his teeth and then sat across his legs and held his wrists. I made a cone of an old newspaper and commenced giving him ether. The doctor stayed with me until the patient stopped hollering and struggling. Then he resumed his sheet metal work.

other vapor irritated the patient's respiratory tract and there was a great outpouring of mucus turned his head to one side wrapped a paper napkin around two fingers and attempted to get the mucus out of his mouth, when suddenly his laws closed down on my fingers like a snapping I expected to hear the bones crunch any turtle minute I did the only thing I could do-I The dentist came out of his workroom, mallet in hand took one glance at the situation and acted He hit that Canuck on the top of the head with the mallet, a blow that sounded like Babe Ruth Iming out a home run The Frenchman's jaw dropped. I retired to the nearest The doctor reached for his forceps and had the two teeth extracted before I got over feeling faint

They say that the cerebration of a drowning man as he goes down for the last time is unequalled in speed but I doubt it I saw in that brief interval before the doctor administered his knock-out the headlines in the evening paper, "River driver dies in dentist's chair, choked to denth by two fingers of young doctor administering his first anesthetic." I saw my whole life

runed

When I had recovered sufficiently, I asked the dentist if he thought he could manage the patient "Oh ves," he said, "I can manage him all right I am used to these birds I he gets unruly"—and he waved his mallet airily—"I'll give him a little more anesthetic

I have always had a high opinion of that dentist and as I have thought of him in the succeeding years, his promptness and efficiency have grown on me, but it was not until this year that his uncanny prescience was brought home to me. His airy gesture with the mallet and his reference to a little more anesthetic I took for a sample of humor which seems indigenous way down east. But when I read an account of the eighth symposium of Colloid Chemists held in Ithaca, last June, I realized the surprising scientific accuracy of the dentist's words when he called his mallet an anesthetic

Dr G H Richter, national research fellow at Cornell University, in his paper read at that symposium, said

"When unconsciousness comes the cells of nerves turn thick and white, like hard boiled eggs. This congulation is the same whether unconsciousness is due to anesthetics, narcotics, heat, cold electricity, intoxication or a blow on the head.

"During consciousness these cells are almost transparent But chloroform, ether, various forms of alcohol, paraldehyde and choral hydrate cause them to turn white Jarring due to tap ping, also makes them whiten This whitening is a precipitation such as is produced in eggs when cooked, differing from eggs because it will

return to its original state when the narcotic is removed or the effects of the blow wear off Fading of the white and disintegration of the coagulation begin when the anesthetic is removed and requires fifteen to twenty-five minutes. If coagulation goes too far, it becomes irreversible and death ensues. The cells are then whiter and harder in appearance."

So you see according to the Colloid Chemists, it does not make any difference whether the anesthetic is ether, chloroform introus oxide spinocaine avertin, luminil or a blow on the head—the end results as far as sensory nerves are con-

cerned are all the same

But the effect these different anesthetics have on the respiratory tract the heart and circulation and the parenchymatous organs are all different and in selecting an anesthetic one should be guided accordingly

In choosing an anesthetic the first consideration is the safety of the patient, the second is the comfort of the patient | Taking it by and large ether still holds the first place as to safety during the administration period. It seems to be the gen eral opinion that any one can give ether all know that in a pinch the ether can and mask are often turned over to a nurse or a relative or a neighbor or even to the hired man with the injunction "Sork it to 'em" Safe enough perhaps for anesthesia lasting only a few minutes but not so safe if the anesthesia is to be continued any length of time The less ether that is given the safer is the anesthetic. This fact accounts for the great number of barbituric acid derivatives, the so-called basal anesthetics that are on the market today A partial list includes barbital allonal, panadorn, pernoctor, sommiferne dial, lummal and sodium amytal They all have their supporters

With avertin as a bisal anesthetic you can keep the patient well under with very little ether. Some patients do not need any ether at all. Some need a little at the beginning of the operation and a little when the peritoneum is being closed if the operation is an abdominal one. There is only one thing that is quite so disconcerting to the surgeon as to have the patient come out of the anesthetic during the operation and that is not to have the patient come out at the finish.

With avertin the patient is fully or partially anesthetized all the time and if he does start to come out a few drops of ether is all that will be needed. Avertin gives a smooth anesthesia and a smooth anesthesia adds to the patient's safety for it enables the operator to do his work quicker and better when relaxation is complete and continuous.

When the comfort of the patient is considered all the evidence is on the side of the bisal anesthetics. The average patient, I think dreads the anesthetic more than the operation. The average

# END RESULTS OF THYROIDECTOMY IN CASES OF HYPERTHYROIDISM AND TOXIC ADENOMA\*

# A study of 200 Cases

# By ARTHUR B. RAFFL, M.D., F.A.C.S., SYRACUSE, NEW YORK, N. Y.

LTHOUGH the first thyroidectomy for hyperthyroidism was performed by Tillaux as far back as 1880, it is only within the past twenty years that the great strides have been made in the development of thyroid surgery which have placed it on its present secure foundation. During this period the literature has emphasized the importance of preoperative treatment, and the time and type of operation, and has noted the gradual lowering of the mortality rate to less than one per cent. Less attention, however, has been paid to the results obtained by operation.

The value of thyroidectomy in cases of thyroid toxicity is admitted. This study of a group of 200 unselected cases of hyperthyroidism and toxic adenoma was made for the purpose of estimating the value of subtotal re-

moval of the gland.

The patients ranged in age from 10 to 78 years and their basal metabolic rates varied from plus 10 to plus 98. In all cases in the series the typical bilateral resection of the gland, including the isthmus and pyramidal lobe, was performed, a narrow strip of gland and the posterior capsule being left on either side of the trachea. The greater number had a combined gas, oxygen and novocaine infiltration anesthesia, about ten per cent had novocaine alone. In a certain proportion of these cases, lobectomy alone was performed in one or two stages, and in a few the lobectomy was preceded by ligations (Chart II), but the proportion of gland removed was the same in all cases.

First, a study was made of the series as a whole. The cases of hyperthyroidism were then divided into three groups on the basis of metabolic rate, and finally they were grouped according to the duration of the disease. Special attention was given to the relative frequency of symptoms and to the complications of thyroidectomy as related to the severity and duration of the disease.

In the entire group of 200 cases, 170 were cases of hyperthyroidism and 30 were cases of toxic adenoma (Chart I). As our criterion for the latter diagnosis we took Plummer's description of this clinical entity which has been called by some adenoma with hyperthyroidism, and by others merely a type of hyperthyroidism. In the hyperthyroidism group, the metabolic rates varied from plus 10 to plus

98, while in the adenoma group, the metabolic rates varied from plus 20 to plus 48. Plummer states that the metabolic rate in cases of toxic adenoma is plus 30 or less. In the majority of our cases of toxic adenoma the metabolic rate was near plus 30 but several patients who gave a history of long standing tumor before toxic symptoms appeared had a metabolic rate of plus 40 or over. The duration of the disease varied in much the same way in the two conditions. However, the earliest case of toxic adenoma was seen four months after the onset of toxic symptoms, while many of the cases of straight hyperthyroidism were seen much earlier. The delay in the former group is probably owing to the fact that toxic adenoma is more insidious in its onset and not so clearly defined in its early stages as are some of the florid types of hyperthyroidism. which are often acute.

In the hyperthyroidism group, the average number of preoperative days means the number of days spent in the hospital prior to operation. This figure, 6.5 days, is not entirely representative, because a certain number of patients with severe hyperthyroidism had part of their preoperative rest and treatment at home under the supervision of their physicians and myself: However, there is considerable variation in the number of preoperative days in the two groups (Chart I). This is probably owing to the fact that rest and especially Lugols solution have little or no effect in most cases of toxic adenoma. I agree with Allen Graham that some of these cases do respond to iodization and we nearly always use Lugol's solution in bad risk cases; as yet we have seen no harm from its use.

The average number of postoperative days in the hospital is very nearly the same in both groups (10.3 and 10.8 respectively) because the time required for the healing of thyroid wounds is nearly always the same, and usually the reaction to operation, even in severe cases, is over in three days. However, the period of rest after leaving the hospital is not always the same. In the mild cases sometimes a month is sufficient, while in the severe cases a rest period of three to six months is wise.

It is hardly fair to compare complications in two groups in which there is such a great difference in the number of cases, but Chart I shows that there is very little difference between the percentages of complications in the two groups.

<sup>\*</sup> Read at a meeting of the Onondaga County Medical Society, March-4, 1930.

CHART I In analysis of the results of thyree lectomy in hyperthyre idism and toxic adenoma

The complications in the hyperthyroidism group will be studied more completely later in this report. However, it might be well to state that such complications as recurrence, tetany, myyedema, and hyperthyroid reaction have never been seen in cases of toxic adenoma but are found after thyroidectomy for hyper thyroidism. It will be seen at once that these complications are all directly referable to the gland itself and are due to the differences in operative procedure necessary for cure

The pathology of thyroid toxicosis is very interesting because of the great variation be tween the microscopical picture and the clin-Some observers say that the ical findings administration of iodine so changes the pic ture of hyperplasia that often the condition cannot be recognized, others hold that the picture is changed but that the hyperplasia ian still be distinguished We have found that the administration of jodine alters the picture of hyperplasia but does not destroy it However, this does not explain the fact that in some of the very definite cases of thyroid toxicosis only colloid or normal glands were present and that this was true before jodine came into use in preoperative treatment series showed a positive hyperplasia in 91 per cent of the cases the remaining 9 per cent showing pathological pictures of colloid collord adenoma, and normal gland. In every case of toxic adenoma we found remove or more A 10-11 idenomata of the fetal type 1

metabolic rate was high, all of the glands showed a definite hyperplasia, the percentage of hyperplasia stendily increasing with the increase in metabolic rate. Among the moder ately severe cases, six showed other pathology. The case with the normal appearing gland had all the symptoms and signs of hyperthyroidism with definite exophthalmos.

In estimating our percentage of cures, we were obliged to choose some basis for deciding when a case was cured. We felt that the most practical criterion was to take the patient's word for it. If, after a year had elapsed, there were no complaints referable to the thyroid gland, we felt justified in calling that patient cured. Of course, many of these patients had residual symptoms owing to their prolonged illness, but the disease itself was cured and the patients felt well.

On this bisis, then, 946 per cent or 161 out of the 170 cases of hyporthyroidism were cured. Four of the patients listed as cured had recurrences and were operated upon the second time before permanent relief was obtained. In three of these cases with recurrences, the first operation had been performed elsewhere. The death, which was due to car dire failure, occurred in a long standing, severe case of goiter with a high metabolic rate, complicated by dementia and curicular fibrillation. In the adenoma group the results seemed more unitormly good. It is true that in some of the cases the blood pressure clevition did not a second control of the cases the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure clevition did not a second case the blood pressure case the second case the case th

CHART II .- An analysis of the results of thyroidectomy in hyperthyroidism, on the basis of metabolic rate,

come down to normal, but generally speaking, these patients were more completely relieved of their symptoms than were the patients with hyperthyroidism. These findings in the adenoma group are not in agreement with the findings of some of our ablest surgeons, but in our small series of cases to remove a toxic adenoma was to effect a cure.

The percentage of cured cases was practically the same in both groups, but this does not mean that in the more severe types the "cured" patients did not have more residual symptoms. However, these patients were so relieved that their residual symptoms were disregarded and they did not complain.

The patients included in the "improved" group showed very little improvement objectively, but they had a normal metabolic rate and none of them felt that there had not been a change for the better. There was no patient in this series that did not respond more or less favorably to thyroidectomy. Since that time, however, we have had one case in which there was so little improvement after lobectomy that

we have not encouraged removal of the remaining lobe.

It is a well-known fact that the treatment of hyperthyroidism depends to a great extent upon the severity of the disease. In this study we have grouped the cases into three classes according to metabolic rate (Chart II). The rates chosen to best represent the mild, moderate, and severe cases were plus 10 to plus 30. plus 30 to plus 50, and plus 50 and over respectively. The greater number of cases fell below a basal metabolic rate of plus 50. The mild and moderate cases were about equal in number. It must be remembered, however, that the metabolic rate is not a complete criterion. A long-standing case may have a rate of below plus 30, and a severe case in a period of remission may not show much elevation. However, for want of a better way to make a statistical review of cases in relation to the severity of the disease, the series was grouped as shown in Chart II. As shown in the chart, the duration of the disease has no relation to the metabolic activity. A proportionately

larger number of severe cases came to operation early because of the fact that severe hyperthyroidism demands immediate attention. The reason that some of these patients waited for years before coming in for examination was that they were able to overcome the exacerbations by periods of rest in bed, or because of their fear of an operation

There is no question that the rate of metabolism influences the choice of operative procedure (See Chart II). In each of the 67 cases in which the rate was low, a complete operation was done, while among the moderately severe cases nine required lobectomy. The majority of these partial operations were necessary because of the patient's condition at the time the first lobe was removed, while in the cases of severe hyperthyroidism the ligations and lobectomies were, for the most part, premeditated. Ligation is rarely necessary since the value of iodine and longer periods of preoperative rest in bed have received recognition. In this series a ligation was performed in only two cases, and they were among the earlier cases. In the last hundred cases no

ligations were done.

Chart III shows a grouping of the cases of hyperthyroidism in the series on the basis of duration of the disease to which it will be seen that the basal metabolic rate apparently bears no relation. It may be high or low, early or late in the course of the disease.

The time factor also seems to have little effect on the pathology. In our series the 82 cases which came to operation more than six months after the onset of symptoms showed a slightly higher percentage of hyperplasia than did the earlier cases. However, there seemed to be a fairly definite increase in operative risk in relation to the duration of the disease as shown by the type of operation. Of the cases which came early to operation subtotal thyroidectomy was performed in 93 per cent, while of the cases which came late only 72 per cent had subtotal thyroidectomy. Undoubtedly this is owing to the fact that in many of the cases which came late myorcardial damage had taken place.

The results of operation, too, seemed to be affected by the duration of the disease. Of

	92% Hyperplasia	72% One Stage	, 87% Cured

the cases of less than 18 months duration, 96 per cent were cured, while of the cases of longer duration, only 87 per cent could be so classified.

From the above observations it will be seen at the duration of the disease prior to operates is a definite factor in treatment and cure.

In Chart IV is shown a classification of the through of thyroidectomy in hyperthylicase. There is a definite increase of complications as the rate and as the duration of the list true that some of these can say that in the cases the difficulties cases the difficulties of the surgeon

The state of the s

roid tissue removed, and a good end-result

The two cases of tetany were mild and did not last beyond the hospitalization period. They responded immediately to parathormone.

The case of myxedema is receiving small doses of thyroid extract and is improving. Of course, there are, and should be, many cases of mild myxedema in the early post-operative period. They are not classified here because they recover uneventfully.

Both cases of recurrent nerve paralysis were unilateral. There was an inspiratory stridor while the patient was still on the table which cleared up after the anæsthesia was stopped. A huskiness of voice persisted for four to six weeks when the other cord compensated for the paralysis, and a natural although not strong voice returned.

The case of hemorrhage from the right superior thyroid artery, although severe, was controlled early, and except for some distortion of the scar, there were no immediate or permanent ill effects from it.

In our group of cases of hyperthyroidism we found many variations in the symptom complex. Chart V lists most of the important

CHART V -Relation of symptoms to basal metabolism in hyperthroidism

symptoms, divided into groups according to the basal metabolic rates of the patients most reliable symptoms are tremor, tachycardia, nervousness, weakness, and enlargement of the thyroid gland I his last symptom need not be present, but in our series there was an increase in the size of the gland in each case, which was demonstrated at operation Exophthalmos was present in 43 per cent of the In general, it seemed that the exophthalmos appeared late in the disease, and that nearly all of the more pronounced cases of hyperthyroidism showed some exophthalmos In a few cases, however, the chief complaint was referable to the heart-these are the socalled "thyrocardiacs" of Lahey which ran a course of many years without protrusion of the eyes

#### CONCLUSIONS

1 The longer the duration of the disease the greater the operative risk and the more likely a permanent residual damage after the activity of the thyroid gland has been cut down by thyroidectomy. The early case with a high basal metabolic rate has just as good a chance for iccovery as has the milder case

- 2 Although it is remarkable to what extent the heart will recover after operation, many patients show a weakness in this respect as demonstrated by inability to hold the breath, and exaggerated response to mild exercise
- 3 Exophthalmos of recent development nearly always clears up after thyroidectomy, but it is the last symptom to go In a few cases it remains
- 4 The subjective symptoms practically always disappear. In from four to seven days after operation the patient feels perfectly well
- 5 Hyperthyroidism is not always accompanied by hyperplasia. Moreover, the changes in the gland can not be explained as being due to iodin. The results of thyroidectomy for hyperthyroidism are as good in non-hyper plasia as in hyperplasia.
- 6 A patient with a case of hyperthyroidism of short duration returns entirely to normal after operation
- 7 All cases of hyperthyroidism are improved, and most cases are cured by thyroidectomy, and the operative risk is very slight, in this series, 0.5 per cent

# MILKBORNE OUTBREAKS IN NEW YORK STATE\*

# By PAUL B. BROOKS, M.D., DEPUTY STATE COMMISSIONER OF HEALTH, ALBANY, N. Y.

**7** O preface the presentation and discussion of the tabulations which are to follow let me say that all of the data to be presented relate to the State, exclusive of New York City. Estimated roughly, about 80% of the milk sold in the cities is pasteurized, the proportion pasteurized varying from about 99% in Buffalo and Yonkers to none (at the last report) in one small city. We have not yet attempted to collect complete data for the villages and towns. We hope to do this in the course of the State-wide survey that will soon be begun. It is well known, however, that a much smaller proportion of the milk sold outside of the cities is pasteurized. The quantity of Certified milk sold in the entire area is very small, as compared with that of other grades.

of the grand total. About 5% of the total number of cases of typhoid fever reported during this period occurred in these milkborne outbreaks.

The outbreaks of septic sore throat were few in number, but the numbers of cases in the individual outbreaks were large. Of the total number of reported cases during this period about 16% occurred in these four outbreaks. In 1929 about 65% of the total reported cases occurred in the 3 milkborne outbreaks.

As compared with the total reported cases for the thirteen year period about one-tenth of one percent of the cases of diphtheria, scarlet fever and poliomyelitis, and one percent of dysentery occurred in these outbreaks.

Although some of the outbreaks naturally in-

Table No. 1 shows, by years, the milkborne outbreaks of communicable disease and gastroenteritis which have occurred in the thirteen year period from 1917 to 1929 inclusive. It will be noted that there were 91 such outbreaks, an average of 7 yearly, with a total of 2511 cases.

The predominance of typhoid outbreaks is striking, 64, or about 70% of the total number having been outbreaks of typhoid fever (with a few outbreaks of paratyphoid included under this head). The typhoid cases represent about 42%

\*Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 3, 1930.

volved both urban and suburban or rural areas, cities were chiefly affected in 28, or 30% of the outbreaks and rural areas in 63, or 70%. The cases were distributed in practically the same proportion.

Of the 91 outbreaks, 89 were traced to raw milk, (in 2 instances to Certified) and 2 to pasteurized. Of the two outbreaks traced to pasteurized milk one of 23 cases of typhoid fever occurred in 1923 and is recorded as having been traced to an unrecognized case in the pasteurizing plant. The contamination was believed to

have occurred following pasteurization. The other, an outbreak of 29 cases of scarlet fever, occurred in the same year and is said to have been traced to missed cases on a farm. There apparently was a question, at the time, both as to apparatus and efficiency of operation in this plant and evidently the milk other was not pasteurized or the operation was inefficient. Both of the outbreaks traced to Certified milk occurred in one county. One, in 1920 included 70 cases of diphtheria, the other in 1924 60 cases of para-typhoid. Both are recorded as having been traced to carriers on the farms. Included in the

supplying the milk, but the connection was not established bacteriologically, in the others mastitis, although not observed, can not be positively excluded as a possibility

In this connection it may be said that this whole subject of the relationship between streptococcic udder infections and human infections still offers a fertile field for research. In the outbreak 'recorded' as scarlet fever there were cases with eruptions typical of scarlet fever and others in which sore throat occurred but no eruption was observed. A question has been railed as to whether so called scarlet fever and septic sore

<sup>\*</sup>Also case of mastitis in herd, in one outbreak

table also is one outbreak of 7 cases of typhoid traced to cream

In Table No 2 the same outbreaks are classified as to sources of infection. Perhaps the most interesting point brought out here is that carriers on the farms were held responsible for 49 of the 63 typhoid outbreaks, carriers in plants were responsible for two "Probable' usually means that the epidemiological evidence pointed to a carrier but confirmatory bacteriological evidence for one reason or another was not obtained

Considering all diseases, cases on the farms were responsible for 23 outbreaks and cases among plant employees for 2

Udder infections were known to be responsible for 6 outbreaks —all of the four of gastroenteritis, one recorded as scarlet fever and one septic sore throat. In one other septic sore throat outbreak there was a case of mastitis in the herd

throat attributable to infected udders are distinct entities or only different manifestations of the same infection

These tables indicate that although there has been a decided improvement, generally speaking, in the "saintary quality" of our milk supply and while pasteurization clearly protects against milk-borne infection, only limited progress has yet been made in preventing the spread of infection through raw milk. If we group the outbreaks shown in Table No. 1 by three year periods beginning with 1918 the number of outbreaks by periods is

1918 20 1921-23 1924-26 1927-29 15 29 33 11

In the carrier periods outbreaks of gastroen territs were not reportable and, since our epidemiological activities were not as well organized

then as they were later, some small communicable disease outbreaks which might have been properly charged to milk may have been missed. A marked decline in the number of milkborne typhoid outbreaks chiefly accounts for the smaller figure in the last period. Table No. 3 presents figures of some interest in this connection.

TYPHOID FEVER
Table No. 3

	1918- 1920	1921– 1923	1924- 1926	1927- 1929
Number Milkborne Outbreaks Number Cases in Such	14	23	20	`4
Outbreaks	217	378	366	29
Total Number Typhoid Cases Reported Percentage of Total	5662	5077	4685	2325
Occurring in these Milkborne Outbreaks	4%	7%	7%	1%

The decline in the last period is no doubt largely accounted for by the general decline in prevalence of typhoid fever. However, the relatively greater decline in the percentage milkborne is apparent. Better control and supervision of known typhoid carriers and cases on farms and elsewhere by health officials, increased resort to pasteurization, the use of mechanical methods of milking, bottling and capping and increased attention to personal cleanliness in handling milk on the farm and in plants, probably have all contributed. Only in rare and isolated instances, except on Certified

farms, and except when the existence of carriers is suspected, are samples of excreta taken from milk handlers for laboratory examination.

Conclusions. In New York State, exclusive of New York City, 91 milkborne outbreaks of communicable disease, including gastroenteritis, occurred in the thirteen-year period, 1917-1929 inclusive. Only two of these were chargeable to pasteurized milk. Approximately 80% of the milk sold in the cities as a whole is pasteurized.

Of the total number of cases reported during this period about 16.0% of the septic sore throat, 5.0% of the typhoid, 0.1% of diphtheria, scarlet fever and poliomyelitis and 1.0% of dysentery occurred in these milkborne outbreaks. In 1929 about 65% of the reported cases of septic sore throat occurred in three milkborne outbreaks. Two-thirds of the 91 outbreaks occurred in areas outside of cities. About 70% of the 91 were outbreaks of typhoid fever.

Contamination occurred at the farm in about 80% of the 91 outbreaks. Carriers on farms apparently were responsible for 49 of the 63 typhoid outbreaks. Udder infections were responsible for all of the 4 outbreaks of gastroenteritis, 1 scarlet fever and 1 septic sore throat and cannot be positively excluded in 3 other septic sore throat outbreaks.

Study of the data by three-year periods beginning with 1918 indicates a sharp decline in the number of milkborne outbreaks of typhoid fever, the percentage of cases in milkborne outbreaks being about 1.0% of the total reported cases, as compared with 7.0% in the previous three-year period.

### PULMONARY TUBERCULOSIS WITHOUT DIAGNOSTIC PHYSICAL SIGNS

By ROBERT E. PLUNKETT, M.D., ALBANY, N. Y.

From the Division of Tuberculosis, New York State Department of Health, Albany, N. Y.

LTHOUGH medicine, and particularly physical diagnosis, was not based upon scientific observations until the eighteenth century, the disease now known as pulmonary tuberculosis was accurately described prior to the Christian era. The initial attempt to use percussion in the diagnosis of disease was made in 1761 by Auenbrugger, and a few years later Laennec, by means of a cylinder of paper, first demonstrated that intrathoracic sounds could be transmitted to the ear of an examiner.

As a result of these observations, medical science has continued over the years to add other methods, as well as to elaborate and improve upon these two scientific elements of diagnosis. This has resulted in making possible the discovery of tuberculosis in its early stages with a consequent saving of human suffering and lives. Valuable as these discoveries have been, is it not possible

that in the teaching of physical diagnosis of tuberculosis too much emphasis has been made on percussion and changes in breath sounds as elicited by auscultation, and that we are too ready to accept them as infallible procedures in the discovery of pulmonary pathology? Text books contain voluminous material on the various gradations of the auscultatory and percussion sounds. The significance of some of these changes are at times evaluated as classical findings in tuberculosis. In contra-distinction to this academic consideration of the diagnosis of tuberculosis, physicians who have been engaged for years in the study of the disease will tell us that the only reliable physical sign as regards the diagnosis of tuberculosis is the presence of rales (following expiratory cough) in the upper part of the chest.

Since Roentgen discovered the x-ray in 1895,

which is an invaluable aid to the diagnosis of tuberculosis, our knowledge of the disease has been materially strengthened. By virture of the observations of such men as Amberson, Sampson, Dunham, Webb, Pancoast and others, we are able more definitely to differentiate between variations in the x-ray of the normal chest and significant pathology.

In the Diagnostic Standards, recommended by the National Tuberculosis Association the only physical sign which is relied on in the diagnosis of pulmonary tuberculosis is the definite evidence of rales which persist for a week or more in the upper half of the chest. Therefore, for the purpose of this study, by the absence of physical signs is meant that no rales were elicited at the examination in the upper part of the chest. Although a slight change of percussion note, or a slight variation of breath sounds may have been evident in some cases, it was not considered sufficiently significant to warrant a positive diagnosis.

It is not the purpose of this review of cases to deprecate the value of scientific precision in the art of diagnosis. There are many cases of early tuberculosis, as well as non-tuberculous lung diseases, in which the most precise examination and interpretation are vital to the welfare of the patient. However, whether it be in a dispensary, or a private office, physicians are faced with the practical problem of analyzing and evaluating the physical characteristics of a great many patients, some of whom are tuberculous. So often have I heard qualified tuberculosis experts say that any

physician who intently auscultated a chest, and analyzed what he heard, could diagnose correctly a large proportion of cases of manifest tuberculosis. On the other hand, it has been said frequently that tuberculosis may exist without demonstrable and significant physical signs. Although both of these statements are sound, the truth of the latter is not generally recognized.

Since 1917 the New York State Department of Health has conducted diagnostic chest clinics in counties in which tuberculosis specialists are not available Although nine different physicians have acted as examiners at the clinics at various times, a large percentage of the patients were exammed by one of three different physicians. These examiners had a minimum period of training and experience in sanatorium or clinic work of seven Several of the cases without physical signs have been examined and checked up by two or three examiners, having available the r-ray and other data pertaining to the patient at the time of examination, and in almost every instance their conclusions verified that of the original examiner

A study of the cases, (all of which had been seen by a physician prior to the clinic), examined from early in 1925 until July, 1929 shows that there was a total of 19,113 examinations. The total number of cases positively diagnosed was 2,054, of which 1,852 were over fifteen years of age. As a consequence of the paucity of physical signs of pulmonary tuberculosis in children, no analysis of these is attempted in this study.

Of the total 1,852 positive diagnoses, 264 (14

### PRESIDENTIAL COMMENTS ON CURRENT EVENTS-NO. 11

Organized medicine was established in New York State in February, 1807, following legislative enactment on April 4, 1806, authorizing medical societies to incorporate for the purpose of regulating the practice of medicine and protecting the community against the ever present tendency of the human mind to credulity and the unusual. In the preface of the history of organized medicine in New York State-one of the earliest efforts in this country—there is the statement made more than a hundred years ago that the history of all the learned professions proves that not one of them has ever become respectable or largely useful to mankind, that was not under the restraint of the great body of its own members. In no other way could there have been an advance in medical education or in the application of scientific medicine, than under the direction of the medical profession, itself:

At its initial meeting, the Medical Society of this state established a prize for the best description of a method of preventing and curing a fever which was evidently typhoid. The effort to prevent disease is not a new thing in organized medicine in this State. It is only in a stage of recrudescence now.

The existence of social trends, public welfare, and public medical service were all recognized at the annual meeting of the State Society in February, 1810, when there was a discussion of methods of the promotion of the "respectability" of the several county societies and the "public relations" of organized medicine and the The two great functions of organized medicine—the advancement and application of scientific medicine and public medical service obligations—were as definitely functions of organized medicine one hundred and twenty-five years ago as today. As time has gone on scientific medicine has steadily and rapidly advanced—very rapidly in the last two decades—and its powerful influence on organized medicine has overshadowed and, perhaps, concealed from view the other great professional function which may be called the obligation to render public medical service.

Medical public service has not so rapidly advanced, because the profession has been so busy in applying scientific medicine to the cure of disease. As time has gone on social changes have brought about an effort to increase the availability of knowledge in limiting illness. The profession has not kept up with the oncoming wave of public sentiment until now, when many organizations representing the public are endeavoring to help to make available that which the profession set out to do more than a hundred years ago.

From the period when gratuities were the common method of professional compensation, medicine has grown to a stage that still holds as al-

most sacred the obligation to cultivate its science and has added a willingness to create economic committees and economic bureaus to guard its material interests when not engaged in scientific discussion. Organized medicine spends a liberal part of its time in meetings assembled, in discussing ways and means to protect its income and guard against the assumed interference with private practice of other organizations, trying honestly enough to make available to the public the resources that medical research has revealed for the limitation of illness and for provision for adequate medical care that the profession, itself, has not so actively advocated as the social trends of the times indicated the need of. There is now a growing trend to consider the future of medical practice and the indications of future relationships of medicine and the public.

A look at the program of the Annual Conference of the Secretaries of Constituent State Medical Societies held in Chicago, November fourteenth and fifteenth, shows plainly a drift toward a new conception of medical relationships. indicates that the day of isolation in medicine is over and that medicine must soon undertake a self-appraisal of its own organization to see if its own public medical relationships are such as to enable it to make proposals for the solution of unsolved and unmet public medical service problems, chiefly just two—the availability of medical knowledge for limiting illness and provision for adequate medical care at a cost that can be met without involving the individual in debt from which he can hardly ever recover. It is the obligation of medicine to propose methods for these things and, also, to work out a solution of how the doctor may be paid for all his services to the indigent or near indigent, either in private practice or hospital service.

Notwithstanding the almost complete transformation of medicine within the recollection of most of us, because of laboratory aids and the use of instruments of precision in diagnosis and treatment, there may come another revolution in medical practice as it has come in the past, as the result of great social needs and social changes; and who knows that it is not beginning? We may be nearer than we know to such things as unlimited old age pensions, provision for adequate medical care by the State, and the inclusion of sickness benefit in Workmen's Compensation and health insurance as in other countries. It should make us think.

The editor of the London Lancet said not long ago, "No longer is the doctor the privileged member of the learned professions. He must take his place in the ranks of other scientific workers. No longer is the medical man the sole repository of authority in medical matters." Therefore, it is necessary for the medical profession to carefully appraise the position that it is making for itself today and to offer some plan for the solution of problems for which others also are busy in finding an answer In the next issue, I shall comment upon the Chicago Conference and the lessons in it, applicable to the coming adjustment of medicine to the changing times W II Ross

### PROSECUTION AND PERSECUTION

Illegal practitioners welcome an attack by medical societies for it least three reasons

- 1 It supplies them with the excuse for the publicity on which they thrive
- 2 It magnifies the importance of the illegal practitioners in the eves of the public, for it demonstrates that they are successful in their competition with physicians in securing the confidence of the people
- 3 It enables the quicks to pose as persecuted martyrs in the cause of alleged truth that is condemned by the Medical Trust '

The medical society that uses the methods of open attack on individual quacks goes contrary to one of the fundamental rules of psychology, which may be stated as follows

Whatever enters the mind through any other route than that of the reasoning faculties, cannot be removed by intellectual appeals to the reason

The appeal of quacks is to the emotions, whose fires are kindled by friction against the medical profession. Illegal practitioners are disconcerted when they fail to arouse the physicians to open attack. Silence may be a weapon of attack as well as of defense for a saying, old and true, runs as follows.

"To ignore an enemy leaves a deeper scar than to attack him"

New York State recognizes the fact that the prosecution of illegal practitioners and quacks is not the function of the medical profession, nor of the Board of Medical Examiners, but it is the function of the State Department of Education, and of the Attorney General Physicians forward their information and complaints to the State Department of Education, which sends out its own detectives and turns the evidence over to an Assistant Attorney General for prosecution, or to the Guevance Committee if the evidence involves a hierased physician. No publicity is given to the charges, and the offender has no opportunity to pose as a marter

These principles are well illustrated by a concrete case in Kansas Dr John H Brinkley was licensed in 1916, and ran a hospital for rejuveniting old men by the implantation of goat glands. He was exposed by the physicians, and on September 17, 1930, his license to practice medicine was revoked by the Board of Medical Examiners. The October issue of the Journal of the Kansas Medical Society, page 383, de-

scribed the case in an editorial entitled "Brinkley's Finish" Yet, immediately Brinkley ran for Governor of the State of Kansas on an independent ticket, and received 180,000 votes at the general election on November fourth

The case against Brinkley received much publicity in the daily press throughout Kansas, specimens of the articles being reproduced in the November issue of the Journal of the Kansas Medical Society. The publicity was so wide that the New York Sim of November 17 gave it cleven inches of an editorial column in an analysis which is clear and informative, and is worthy of study by every member of the Medical Society of the State of New York. Here is the Sim seditorial in full

"The Kansas City Star, which was as amazed as anybody else at the 180,000 votes received by Dr John R Brinkley, goat gland specialist, and 'people's candidate' for Governor of Kansas sent two members of its staff out through the Brinkley belt to get the answer to the question. How did Brinkley do it?" They visited central Kansas, where twenty-four of the twenty-six countes that Brinkley carried are grouped, and they learned that there were several answers to their

"Most of their informants agreed that Brinkley's use of the radio had been the most important single factor in his vote Central Kansas, where his greatest strength was massed, was the area where his station was the easiest for radio owners to get Brinkley's Milford station has been well known for several years in that section, during the campaign many and many a woman who knew the doctor only by his broadcasting was heard to say that a man with such a pleasant voice must be a good man Political workers who were astonished that 180,000 voters could be taught to write in a candidate's name on the ballot and do it without invalidating the billot, attribute some of the Brinkley vote to his artful repetition of the reininder 'Only you and God will be in that voting box

"The reporters of the Star found evidence of a considerable sympathetic vote for Brinkley because of the attacks upon him by the Kansas State Medical Association A Geary County farmer admitted that his family had cast four votes for the Milford doctor 'because Brinkley hasn't had a square deal' The 'people's candidate' appealed to the farmers as one victim of misfortune to other victims he compounded attacks on the Farm Board with his theme of his

and the result is a low blood chloride picture and reduced chloride excretion. Previous to the crisis, no matter how much salt is administered, relatively little is excreted, but in from 2 to 4 days after the crisis its excretion through the urine is resumed. Apparently, when the exudates are resolved, the first chlorides set free are used to replace the lack in other depots, before there is any surplus to excrete. The author believes it is not pneumococcus toxins that cause low blood pressure in pneumonia, but the sudden loss of salt balance, resulting in vasomotor weakness. we know that in some forms of hypertonia, withdrawal of salt lowers blood pressure, it is logical to administer increased amounts of salt when we wish to raise blood pressure. That the falling off of vessel tonus is the result of salt poverty seems very probable. On this assumption Scholz has been giving his patients 10 gm. salt per day orally when they can tolerate it; and when this is not possible, he gives intravenous infusions consisting of 100 gm. of a 25 per cent solution. The result has been an immediate increase of blood pressure, and a shorter and more favorable course of the pneumonia. In a strikingly large number of his 42 uncomplicated cases, the crisis set in within 24 hours. Those patients with chloride deficiency in the blood picture and lowered blood pressure reacted with a stronger increase of blood pressure than those in whom the picture was normal or nearly so. Experimental glucose infusions in animals did not increase the blood pressure, thus proving that it is not the fluid but the salt that produces the Apparently it is the storage of salt in the inflammatory foci that is fatal for the intruding bacteria. This storage, however, robs the organism of its normal chloride supply, and produces hypotonia. By administering salt freely to pneumonia patients we combat circulatory weakness at its source. The infusions should be given very slowly, using 5-10 minutes to inject the entire amount, otherwise tachycardia may appear. When they are given with proper care, no untoward results have ever been observed.

Vitamin Reserve of the Male and the Female Sex.—According to E. Poulsson, the greater demand made on the female than on the male sex in the work of propagation has resulted in the former being endowed with a richer deposit of subcutaneous fat. It must accordingly be assumed that the female, carrying the burdens of gestation and lactation, requires a greater vitamin reserve than the male. The growing fetus makes particularly great demands on the maternal vitamins, notably vitamin A. This vitamin reserve has been slowly accumulating during all

the earlier years of the woman's life, and explains her greater resistance in the face of a temporary The same is apparently true of vitamin D. Priestley's statistics based on a study of 75,000 children showed that twice as many boys as girls have rickets. The female has layers of subcutaneous fat that are wanting in the male. This is shown by the intolerance of women for such heavy woolen clothing as is worn in comfort by men, and by the ability of women to remain longer in cold water than men. greater endurance of women swimmers is not a matter of muscle but of resistance to cold. That the subcutaneous fatty tissue of woman represents the storehouse for the vitamins is still only a hypothesis, which must be tested by animal experiments. A preliminary test with the antimony chloride staining reaction on a cow and a steer, both yearlings and therefore at the age of reproduction, came out 15 to 1 in favor of the cow, whose soft yellow fat was in contrast with the fibrous, colorless fat of the steer. In two human cadavers available for examination the fat of a woman of 49 was to that of a man of 25 as 2 to 1. Here the age of the woman was not the most favorable, since after the age of child-bearing has been passed she no longer needs a vitamin reserve. But the result is in general agreement with Priestley's statistics.—Deutsche medizinische Wochenschrift, October 3, 1930.

Pseudosciatica.—J. A. Chavany, writing in the Progrès médical of October 4, 1930, points out the frequency with which a diagnosis of rheumatismal sciatica is erroneously made in cases in which pain in the region of the sciatic nerve is in reality due to disturbance in the cellular tissue (cellulitis), the muscles (myalgia), the bones and joints (chronic arthritis), or the circulatory system (spasmodic or organic obliterations). These wrong diagnoses, which are made daily, are the basis of numerous failures of treatment directed to the cure of purely nervous pain. In the first group careful exploration will reveal rounded or oval nodules or cords drawn into Here the pain is due to compression or invasion of superficial sensory nerve branches. and should be treated by skilled massage. The cause is frequently insufficiency of the liver or intestinal infection, to which appropriate remedies should be addressed. In the myalgia group, pain appears only on motion, and is calmed by the dorsal decubitus. It is due to the twitching of sick muscle bodies, and only the muscles are involved, especially those which contribute to the function of attitude. It yields readily to antirheumatic remedies, such as sodium salicylate. ionized salicylates, or novocaine given epidurally. There is no nerve pain, but its differentiation from sciatica is related less to the symptoms themselves than to their interpretation. In chronic arthritis of the hip, sometimes bilateral, the key

to the diagnosis is in the methodic exploration of joint mobility which should be carried out in every scratic patient. There should also be bilateral r ray examination, with the thigh extended in internal rotation, unless ankylosis prevents the early stages osteophytes will be seen it the umon of the neck and the head with frintness of the articular interline and a slight prominence of the external margin of the acetabulum profile as well as a face view should be taken In later stages deformations will be observed that cannot fail of recognition I reatment consists of iodized ionization over a long period or radio In the fourth group diagnosis is made by the Pachon oscillometer if there is afternal There may be lesions of the sympathetic innervation of the arterial coats pain occurs when the patient walks but not when There are pe pressure is made from without riods of exacerbation and remission Treatment consists of antispasmodics injections of de insulated pancreatic extracts diathermy of the lower extremities and radiotherapy of the suprarenal region. Occasionally varicosities will cause pain resembling sciatica, which yields to injections of suitable sclerosing medicaments

Observations on Visceral Pain-R D Rudolf and A G Smith, after reviewing vari ous theories on the question whether pain is felt in the viscus under suspicion or is referred to superficial structures, conclude that some kinds of visceral irritation produce only referred pain and others apparently only true visceral pain while often both exist. In many instances the referred pain is the only one that reaches the level of consciousness In 50 cases 13 of which are here reported, pain was relieved by intracutaneous injections of 2 per cent novocame, made with a thin flexible needle so as to produce raised white wheals These cases show that it is usually easy to relieve the referred part of visceral puin by local anesthesia, and also sometimes to dull to some extent what appears to be true visceral Several theories have been advanced as to how local mesthesia acts in these cases. Verger attributes the effect to counter-irritation, but in the experience of the writers saline injections did not relieve the pain nearly as well as did After discussing other explanations that have been offered the writers advance the theory that for referred pain to occur it is essen tial that the whole sensory reflex are be intact In referred pain the suffering may be lessened by an attack on either end of the viscero sensory Thus the referred pain in angina reflex arc pectoris can be diminished by anesthetizing the printul area on the surface or more specifically by relieving the tension in the heart or arota by lowering the blood pressure, the surface pain in luliary colic may be wiped out by infiltrating the skin or by relaxing the biliary passages by benzyl

benzoate, that of duodenal ulcer by anesthetizing the skin, or by the administration of alkalies, and 50 on -American Journal of the Medical Sciences, October, 1930, clxxx, 4

The Similarity Between Tumor and Normal Tissue -L A Turley says that because we find that a tumor is a mass of heterogeneously arranged atypical cells we are not justified in assuming that the tumor has arisen from an embryonic cell rest, or that the pseudoembryonic character of the cells is an essential tumor char acteristic, but that these two phenomena are just what we should expect to find in any mass of rapidly reproducing cells whatever the stimuluto reproduction was Therefore it is necessary to keep in mind the facts that among tumor cells lack of specialization and orientation, both in degree and kind, are due, partially at least, to the fact that they are rapidly reproducing and not to the fact that they are tumor cells The shape of the cells of a tumor will depend on the differences in the resistance at different angles which they have to overcome when developing, so fusiform and polyhedral cells may be found in the same From this it will be seen that the shape of the cells should not be used in classifying Tumor cells, like those of normal tissue, tend to specialize orientate, and arrange them selves like the tissue from which they arise Another point of resemblance of tumor to normal tissue is in the juxtaposition of the cells and the presence or absence of intercellular material the tumor arises from epithelial tissue we find the cells approximated and moulded to each other without any intercellular material. If it arises from connective tissue, we find more or less intercellular material in the form of fibroglia or col lagen fibers Still another similarity is the effect of the new mass of tissue on other tissues in the neighborhood Connective tissue, except the most embryonic always stimulates the development of vascular tissue. Connective tissue may stimulate the growth of epithelium, so that no matter how large a connective tissue mass becomes, if it is next to epithelium, the epithelium will cover it Here we have a clue to the origin of tumors, from what tissues they arose, if we know the mutual relationship between the various tissues, because tumor tissues behave like normal tissues as regards their effect on other tissues so far as development is concerned. Tumor cells are like normal cells in that they tend to function like the cells from which they arose Thus the cells of a chondroma are surrounded by chondromucin and in adenomis of the thyroid we often have An understandsymptoms of hyperthyroidism ing of these facts helps one to understand the character of certain tumors and explains to some extent the malignant character of tumors as to both classes and individuals - Southern Medical Journal November, 1930 xxm, 11

#### MALPRACTICE—STATUTE OF LIMITATIONS

By LORENZ J BROSNAN, ESQ. Counsel Medical Society of the State of New York

The Court of Appeals of this State was re cently called upon for the first time to pass upon the question as to the date from which the statute of limitations begins to run in an action against a physician for malpractice. The case in question was handled on behalf of the physician by your counsel and it was bitterly contested and bitterly fought through three courts, the Supreme Court, the Appellate Division and finally the Court of Appeals Your counsel is happy to state that he was able to secure in this very important case a unanimous decision from the Court of Appeals adopting the contentions urged on behalf of the

physician

The complaint in this case, after alleging that the defendant was a duly licensed physician and that he had been employed to operate upon the plaintiff, charged that in the performance of the operation the defendant negligently and carelessly permitted to remain within the plaintiff's body a pair of artery forceps, and that these forceps were left in the plaintiff's body without her knowledge and while she was under a general anesthetic The complaint then charged that the defendant carelessly, negligently and in violation of the duties of his employment failed and refused to inform the plaintiff that the artery forceps had been permitted to remain within her body and concealed that fact from the plaintiff further charged that these forceps were permitted to remain in the plaintiff's body for a period of over two years when the plaintiff, who alleged that she was continuously ill during this period, went to another physician who had r-ray photo graphs taken disclosing the presence of said forceps, and it was further charged that then for the first time the plaintiff knew of the presence of said artery forceps. The complaint further alleged that the plaintiff immediately submitted to an operation for the removal of said forceps, and that as a result of defendant's negligent and careless acts and concealment the plaintiff was damaged in the sum of \$100,000

The defendant physician denied the charges of negligence and concealment contained in the complaint, and since the defendant physician did not treat the plaintiff subsequent to June of 1925 and the action was not commenced by the plaintiff until July of 1929 your counsel moved on behalf of the defendant to dismiss the action on the ground that the alleged cause of action was barred by the statute of limitations of this State apply-

ing to malpractice cases, which provides in sub stance that actions for malpractice must be begun within two years after the cause of action has Thus, there was squarely presented to accrued the court the question as to when the cause of action in this case accrued to the plaintiff should be explained that in a motion of this character, the court hearing the motion must take as true for the purpose of the motion all of the allegations of the complaint. In opposition to our motion the plaintiff raised the following contentions

(1) That the two-year statute of limitations did not apply since this was not a cause of action for malpractice but a cause of action for fraud In this contention the plaintiff relied upon the allegations with reference to the fact that the defendant had concealed from the plaintiff that he had left within her body at the time of the

operation a pair of artery forceps

(2) That even if the cause of action be deemed one in malpractice the statute of limitations does not begin to run until the discovery of the alleged injury, and, hence, since the plaintiff did not discover the injury until the 12th day of July, 1927, the present action was timely having been commenced on the 5th day of July, 1929 In other words, the plaintiff contended that the cause of action set forth in the complaint did not accrue within the meaning of the two year statute of limitations until the claimed discovery of the presence of the artery forceps

(3) Plaintiff further contended that the two year statute of limitations as applied to malprac-

tice actions was unconstitutional

The Supreme Court denied our motion to dis-

miss the complaint, saying in part.

"The complaint in form alleges a knowledge by the defendant of the fact that the instrument was imbedded in the prtient's abdomen. This allegation, which, for purposes of the pleading, is taken as true implies a positive and continuing duty to correct the error, which the surgeon \* \* \* failed This duty may be presumed to have been to do a continuing one as likewise the injury caused by such omission, and the statute of limitations did not run during such period unless the patient during that time knew or should have known of the situation"

And the court further said

"Of course nothing that has been said in this opinion is to be taken as a disposition of the actual facts, except in so far as they must be technically deemed true for purposes of this motion."

From the order entered upon this decision, on behalf of the defendant physician we appealed to the Appellate Division. In that court we secured a reversal, with one justice dissenting, of the order of the court below. The majority opinion of the Appellate Division said in part:

"There is no escape from the conclusion that the allegations of the first cause of action of the complaint clearly show that the action is based on malpractice, although it may be otherwise designated. The action was not commenced until four years after the operation took place and after the defendant attended and rendered services to the plaintiff. The time within which to bring such an action being limited to two years, the statute of limitations is a bar. \* \* \*

"The plaintiff argues that the statute should begin to run from the time of the discovery of the malpractice. The decisions setting forth the purpose and effect of such statute are to the

contrary."

And the court further said:

"A distinction is sought to be made because it is alleged the defendant knew that he left the forceps in the body of the plaintiff, but that distinction appears to be unsound. Similar efforts to save a cause of action from the bar of the statute have failed in the appellate courts."

It was curious that the point here involved had never before been passed upon by the Court of Appeals of this State. From the judgment of the Appellate Division the plaintiff appealed to the Court of Appeals which court, after your counsel filed written briefs and also orally argued before the court, handed down a unanimous decision affirming the judgment of the Appellate Division and dismissing the cause of action as being barred by the statute of limitations.

This decision is of vital importance to the entire profession, since far more than the mere question as to whether the statute of limitations had run in this particular case was involved. For the first time in the history of this State, we have secured on behalf of the physician a ruling from the Court of Appeals that the discovery of the alleged malpractice by the patient is not the controlling feature in determining the time from which the statute begins to run. It is fair to say also that had the plaintiff been successful in the contentions here made, other claimants against physicians would have been encouraged to allege concealment on the part of the doctor and in this way nullify the two-year statute of limitations.

### CLAIMED NEGLIGENT TREATMENT OF SCROTAL HYDROCELE

In this case the plaintiff was a man, 69 years of age, who had from time to time been treated by the defendant doctor for bronchitis, asthma, and a bad cardiac condition. The doctor was a general surgeon who specialized in gynecology and abdominal surgery.

The patient consulted the doctor at his office and upon examination the doctor found him to be suffering from scrotal hydrocele.

An operation for the purpose of the removal of this fluid was advised and consented to. The doctor advised tapping the fluid rather than an open operation because in cases of elderly people an open operation of this nature is often rather serious. The patient consented and was placed upon the operating table in the doctor's office. The doctor sterilized a hypodermic or aspirating needle and inserted it about one-half inch into the scrotum above the testicle. Because of the position of the plaintiff on the table, the doctor was certain that the testicle had dropped down to the bottom of the scrotum, preventing any possibility of puncture by the needle. Five to six fluid ounces of a straw-colored fluid were drained off into a receptacle at the end of the needle. The doctor then sealed the puncture in the scrotum which

the needle had made with some collodium. The operation was apparently successful in every way.

Some time later, much to the surprise of the doctor, the patient informed him that following the treatment, he had experienced considerable pain in the scrotum and that it had become swollen, and he had been obliged to call in another doctor who ordered him to a hospital where one of his testicles was removed by an operation. The patient complained very bitterly about this loss, claiming that he was unable to have any intercourse with his wife. The doctor had previously strongly advised against his having sexual intercourse on account of his cardiac condition, and had informed him that he might very possibly die in the act.

Suit was brought against the defendant doctor to recover damages, alleging that the defendant doctor had used unclean instruments which resulted in the necessity of amputating one of the plaintiff's testicles in order to prevent bloodpoisoning, and setting forth that the plaintiff had suffered great pain and agony.

Before the action could be reached for trial the plaintiff died from other causes and the action was ordered abated. This terminated the matter in favor of the doctor without trial.

### ALLEGED NEGLIGENCE IN TREATING INJURED FINGER

In this case the patient called at the office of defendant doctor complaining of an injury to her right thumb, which she claimed was caused by running a needle into her finger while sewing. The thumb was considerably swollen and quite tender to touch.

The doctor advised wet dressings of hot boric acid. Upon her return the next day the doctor observed that there was then pus present in the finger. At the first call there was no sign of pus. He made an incision in the lateral surface by means of a sterile scalpel, applying a local anesthetic of novocaine, reduced the pus and dressed the wound. The patient returned daily for dressings until about the fifth day when another pocket of pus was detected and drained. She returned thereafter for daily treatments until-several days later, when the finger appeared to be so much improved that the doctor advised her to dress it herself, but to call at his office three days later.

At the appointed time she appeared, and the doctor found osteonylitis of the terminal phalanx had developed. This inflammation, the doctor contended, had necessarily set in before he ever treated the woman, as he had taken every possible precaution. He advised her that she required surgical treatment, with the result that her thumb was amputated at the first joint by another doctor who specialized in surgery.

Some time later the patient returned to the defendant doctor, exhibiting the amputated thumb, and demanding that he return the fee that she had paid him for his care and treatment of the case. The doctor, of course, refused to comply with this request, and actions were started by the woman and her husband against the doctor.

These cases were never noticed for trial, however, and after a period of about three years, a motion was made in behalf of the defendant to dismiss for lack of prosecution, which motion was granted. This terminated these actions in favor of the doctor.

## DEATH CLAIMED DUE TO FAILURE TO DETECT HEART CONDITION DURING PREGNANCY

The defendant in this case was a physician and surgeon who specialized in obstetrics, and conducted his own maternity hospital. He was consulted by the plaintiff, a woman about seven months pregnant, and she made arrangements that she be delivered at said hospital where she engaged a room and was to receive the personal care and attention of the defendant doctor.

At that time he examined her and found her apparently in a normal condition, and directed her to come back for further examination about

every two weeks.

Three weeks later she returned and the doctor found her condition to still be normal and she made no complaint of any form of illness. Upon each of her visits he took specimens of her urine, which he found to be normal. She did not come back again, however, and the next he heard of her case was about a week later when another doctor notified him that this patient was ill at her home and was vomiting blood and that he was treating her. The defendant told the second doctor to continue caring for her and that he did not care to interfere, as his arrangements with this woman were to deliver her at the proper time.

Two days later the second doctor notified the defendant that the woman had been removed to

a hospital and died. The second doctor, when he first attended her, found her to have a bad heart condition which, accompanying her pregnancy as it did, he recognized to be dangerous, and informed her and her family that she could not be treated at her home but should be removed to a hospital. It was only a short time after her removal to the hospital that she died and the cause of her death was set down in her death certificate as follows: "Chronic endocarditis: mitral strain—chronic nephritis—complicating pregnancy at 8th month." The defendant doctor in his treatment of the case found nothing to indicate that she was in such a critical condition.

Thereafter, two actions were instituted against the doctor, one by the deceased's husband individually and one by him as administrator of her estate. Both actions attempted to charge the defendant with the responsibility for her death by reason of his failure to detect the dangerous condition which developed and caused her death. Before the said actions could be reached for trial, however, one was discontinued by the plaintiff's attorney and the other one was dismissed by the court for failure of the plaintiff's attorney to prosecute said action, thereby terminating the matter in the doctor's favor.

### PUBLIC RELATIONS SURVEY, No. 17-WARREN COUNTY

This report is an adaptation of an address given on September 18, 1930, before the Conference of the Chairmen of the Public Relations Committees of the County Medical Societies by Dr. T. H. Cunningham, Chairman of the Public Relations Committee of the Warren County Medical Society.

Our county has only about 42,000 inhabitants, about half of whom live in the city of Glens Falls. Our Public Relations committee has been in existence for almost a year, and we have made a tentative survey of medical activities, and are astonished at some of our findings. We have found that Warren County stands well in its welfare and public health work. We have found, too, that while individual doctors have been helping in this work, the organized profession as a whole has seldom been consulted in regard to it by other health organizations.

Our committee discovered many welfare and public health agencies which were only slightly known to the members of our local medical profession. We found, too, that while the local physicians knew in a general way of the existence of these agencies, the profession generally had little knowledge of what these agencies were

doing.

Our committee found that the work being done by these health and welfare organizations was so complex and so widespread and bewildering in its scope that it was difficult for us to grasp what was actually being done.

County Public Health Committee: We found that Warren County had a Public Health Committee which was an off-shoot of our Board of Supervisors; and that this committee was doing a tremendous amount of work. In the City of Glens Falls we have a Health Center with a fulltime health officer, and we discovered that much work was being done through this center through the use of various clinics and health nurses. sides this, we discovered that our local Red Cross was doing a great deal of work, and that much work, too, was being done by school physicians, by a Children's Health Camp, by the local Tuberculosis Association, by the Elks, by the Rotary Club, by the Shriners, and by many other lay organizations.

We have accomplished some things. For example, we have made a contact with the County Public Health Committee, and our Committee is now being invited to its monthly meeting; and from this time on we expect to be consulted in regard to its activities.

Tuberculosis Committee: Our Committee has established a cordial contact with our local Tuberculosis organization, and with our local Health Camp directors. We have met with them, and they have submitted their program for the next year's work and have asked our approval of it. This we have been glad to give them, and we have made several suggestions and have assured them of the support of the Warren County Medical Society in several situations which they have said they were not able to handle alone. They were

grateful for our backing in these matters, and a cordial relationship has been established with them

Water Supply: Our Committee also accomplished an important work about a year ago, although our Committee did not appear as being directly responsible for it. The water supply of the city of Glens Falls one year ago was found to be polluted because of the turning into our regular supply, during the time of shortage, of a brook known locally as the Half Way Brook. The New York State Health Department and our local health department immediately issued a warning through the newspapers and asked that our water supply be chlorinated. At that time, the New York State Department of Health did not have the authority to force our local city executives to chlorinate our water, and upon the advice of our city engineers and water board, our city fathers flatly refused to do this.

The Warren County Medical Society immediately published long articles in the Glens Falls newspapers calling the attention of the public to this situation; and I am sure that these articles which were signed by about thirty of our local doctors, forced our city officers to install a chlorination plant. These articles were responsible for the change, and the New York State Department of Health gives our Society credit for having

accomplished this.

County Health Department: Our Committee has interested itself in a County Health Department. Some time ago one of our Glens Falls newspapers, as a political measure, suggested that Warren County establish a County Health Unit. Our Committee was willing to concede that the newspapers had thought of the idea first. We felt, however, that our county physicians should take charge of the matter, that it should be brought about through our County Medical Society, and that the idea should not become a political football.

We asked Doctor Munson, District State Health Officer, to read a paper before us in which he would discuss the matter from all angles, so that our Society might have some first hand knowledge of our local needs and situations. Doctor Munson discussed the advantages and disadvantages thoroughly; and our Society went over the matter at great length, and we felt that it was something to which we should lend our

support.

A resolution was introduced that same evening before our Society to the effect that the Warren County Medical Society wished to go on record as favoring the idea of a Health Unit for Warren County. This resolution was carried, and we took it to our local papers and had the resolution

and the paper which preceded it printed in full in both of our newspapers on the following day It excited a great deal of comment, and within a few days Doctor Parren, State Health Commissioner, came to Glens Falls and called the matter to the attention of the Glens Falls authorities, and the Warren County officials. A meeting was arranged between them to which our Committee was also invited, and a tentative program was arranged by which committees were to be appointed for the city of Glens Falls and the County, to work with our committee in drawing up a general plan for a Health Unit for Warren County. We are to get together this fall for the formulation of final plans, and the probability is that Warren County will have a County Health Unit, and that this will have come about through our Medical Society. In addition to these efforts, we have had meetings with many other of our organizations, and I am glad to say that we have established the most harmonious relations with several.

Parent-Teachers' Association: Some months ago, our committee had a communication from the State Committee on Public Relations regarding the Round-Up Week of the Parent-Teachers' Association. We immediately wrote the local Parent-Teachers' Association and stated that our committee represented the Warren County Medical Society, and that we were ready to cooperate in every way in making this Round-Up Week a success.

Our local Parent-Teachers' Association is a loose organization, and we did not receive an answer to our suggestion for many weeks. Our committee saw the summer slipping away, and we made up our minds that if the local Parent-Teachers' Association would not or could not arrange for the Round-Up, it would be necessary for our committe to do it.

Our committee thereupon wrote letters describing the good that could come from a Round-Up Week and submitted them to the president of the Parent-Teachers' Association, and asked her if she would not be willing to sign them and to permit us to have them printed in our newspapers. These newspaper-letters were worded so that the whole movement seemed to start from the Parent-Teachers' Association and all of the credit for starting the affair would be given to it. These letters were printed in our newspapers, which were very glad to cooperate. Even after this, however, it was not possible to get the Parent-Teachers' Association to carry the matter on any further, and we felt that again the matter was up to us.

We then went to our local Tuberculosis Association and persuaded the head of it to write a letter to the newspapers in which he complimented the Parent-Teachers' Association on starting the effort; and in this letter he pointed out how much

good could be done by the Round-Up Week. We then got the head of the Warren County Public Health Committee to write a similar letter complimenting the Parent-Teachers' Association, and offering the nurses who are employed by that committee to aid in the Round-Up work. We thought that we had in this manner maneuvered the Parent-Teachers' Association into such a position that they would be obliged to start the work; but even then its machinery was unable to carry the load, and we had to write more newspaper articles for them in which we stated that because of the lateness of the season it had been decided to combine the Round-up examination with a Pre-School examinaton: that both of those examinations would be made at the same time by all the physicians of Warren County; and that the physicians would be willing to make both of these examinations and fill out school blanks for the same fee that they would ordinarily charge for one examination. In our newspaper articles, we also had the Parent-Teachers' Association state that it had announcements from the physicians that, where a family found it difficult to pay for such examinations, they would make them without charge.

In addition to all of this, our committee decided that we must write letters from time to time to all of the physicians in our County, in order that they might know of this effort and cooperate with us in it.

All these efforts required much time and energy that should have been done by a paid secretary. However, we finally got the Round-Up started, and we believe that next year we can trust the Parent-Teachers' Association to carry on the work alone. We believe also that this year's effort was very successful, considering all of the difficulties that we had to meet.

Workmen's Compensation: Another thing that our committee is attempting to do for our county is the standardizing of fees for compensation-cases. In our county we have a great deal of that work, and the fees are very unsatisfactory, because the representatives of the insurance companies go about from physician to physician and suggest to them that they bid against each other for compensation work. As a result of this, the fees for compensation work in Glens Falls and vicinity are not satisfactory.

Our committee has appointed a Surgical Committee to work with us in formulating a fee schedule, and we expect within a short time to present to the Compensation Commissioner who comes to Glens Falls, a local schedule of fees. We are going to present the same schedule to the insurance representatives, and we feel sure that our physicians and surgeons will adhere to that schedule. We are not asking for extortionate fees, but we do want reasonable compensation for our work.

### PUBLIC RELATIONS SURVEY, No. 17-WARREN COUNTY

This report is an adaptation of an address given on September 18, 1930, before the Conference of the Chairmen of the Public Relations Committees of the County Medical Societies by Dr. T. H. Cunningham, Chairman of the Public Relations Committee of the Warren County Medical Society.

Our county has only about 42,000 inhabitants, about half of whom live in the city of Glens Falls. Our Public Relations committee has been in existence for almost a year, and we have made a tentative survey of medical activities, and are astonished at some of our findings. We have found that Warren County stands well in its welfare and public health work. We have found, too, that while individual doctors have been helping in this work, the organized profession as a whole has seldom been consulted in regard to it by other health organizations.

Our committee discovered many welfare and public health agencies which were only slightly known to the members of our local medical profession. We found, too, that while the local physicians knew in a general way of the existence of these agencies, the profession generally had little knowledge of what these agencies were

Our committee found that the work being done by these health and welfare organizations was so complex and so widespread and bewildering in its scope that it was difficult for us to grasp what was actually being done.

County Public Health Committee: We found that Warren County had a Public Health Committee which was an off-shoot of our Board of Supervisors; and that this committee was doing a tremendous amount of work. In the City of Glens Falls we have a Health Center with a fulltime health officer, and we discovered that much work was being done through this center through the use of various clinics and health nurses. Besides this, we discovered that our local Red Cross was doing a great deal of work, and that much work, too, was being done by school physicians. by a Children's Health Camp, by the local Tuberculosis Association, by the Elks, by the Rotary Club, by the Shriners, and by many other lay organizations.

We have accomplished some things. For example, we have made a contact with the County Public Health Committee, and our Committee is now being invited to its monthly meeting; and from this time on we expect to be consulted in regard to its activities.

Tuberculosis Committee: Our Committee has established a cordial contact with our local Tuberculosis organization, and with our local Health Camp directors. We have met with them, and they have submitted their program for the next year's work and have asked our approval of it. This we have been glad to give them, and we have made several suggestions and have assured them of the support of the Warren County Medical Society in several situations which they have said they were not able to handle alone. They were

grateful for our backing in these matters, and a cordial relationship has been established with them.

Water Supply: Our Committee also accomplished an important work about a year ago, although our Committee did not appear as being directly responsible for it. The water supply of the city of Glens Falls one year ago was found to be polluted because of the turning into our regular supply, during the time of shortage, of a brook known locally as the Half Way Brook. The New York State Health Department and our local health department immediately issued a warning through the newspapers and asked that our water supply be chlorinated. At that time, the New York State Department of Health did not have the authority to force our local city executives to chlorinate our water, and upon the advice of our city engineers and water board, our city fathers flatly refused to do this.

The Warren County Medical Society immediately published long articles in the Glens Falls newspapers calling the attention of the public to this situation; and I am sure that these articles which were signed by about thirty of our local doctors, forced our city officers to install a chlorination plant. These articles were responsible for the change, and the New York State Department of Health gives our Society credit for having

accomplished this.

County Health Department: Our Committee has interested itself in a County Health Department. Some time ago one of our Glens Falls newspapers, as a political measure, suggested that Warren County establish a County Health Unit. Our Committee was willing to concede that the newspapers had thought of the idea first. We felt, however, that our county physicians should take charge of the matter, that it should be brought about through our County Medical Society, and that the idea should not become a political football.

We asked Doctor Munson, District State Health Officer, to read a paper before us in which he would discuss the matter from all angles, so that our Society might have some first hand knowledge of our local needs and situations. Doctor Munson discussed the advantages and disadvantages thoroughly; and our Society went over the matter at great length, and we felt that it was something to which we should lend our support.

A resolution was introduced that same evening before our Society to the effect that the Warren County Medical Society wished to go on record as favoring the idea of a Health Unit for Warren County. This resolution was carried, and we took it to our local papers and had the resolution

## THE DAILY PRESS

#### THE NATIONAL CHILD CONFERENCE

The Metropolitan dailies of November 20 contain the address of President Hoover at the opening of the White House Conference on Child Health and Protection in Washington, D. C. Commenting on the conference the New York Herald Tribune of November 20 says

"'We approach all problems of childhood with affection,' and President Hoover last night, in his cloquent address at the opening of the White House conference on 'Child Health and Protection' He uttered undoubtedly the keynote to which the men and women of this extraordinary round table have responded in their fifteen months of preparation for the conference. He expressed the thought which his evoked nation wide interest in their three days' meeting it Washington

"More than 1,200 experts in every phase of

cluld welfare who have laid the groundwork for the conference are ready to report and to discuss their findings and recommendations, in which sentiment is fused with fact of their studies may be judged from the size of the compendium, for a volume of 600 pages is required to contain the preliminary committee All the results of their research when published will make a library on child welfare of at least twenty 600 page volumes Mr Hoover considers that the work has been magnificently performed He may well be gratified by the fruition of his child conference plan. It is certain to carry ultimate benefit to the children of every community in the United States, 'lighting,' in the President's words 'the fires of inspiration in the general public conscience and from conscience leading it into action '"

#### NOMENCLATURE OF ANIMAL GROUPS

The younger physicians who have recently passed their Regents tests in Ivanhoe will recall the conversation regarding the change of names of animals from the Anglo-Saxon to the French when the meat appeared on the table,—swine to pork, for example

The opening of the Pet Show in Madison Square Garden on November 18 was the occasion for itens in the New York dailies giving strange names to groups of animals. The editorial page of the New York Times of November 20, carries the following discussion of the terms

The most outdoor of outdoor readers must have learned some things they didn't know in the *Times'* spirited account yesterday of the

opening of the Pct Show in Madison Squite Garden. They knew, of course, before reading the gay composition that hounds are a 'pack,' basebill players are a 'inne' and partridges are a 'covey'. But probably few knew also, as the reporter informed them, that these are the correct terms for certain aggregations of the brute kingdom.

"'A nye of pheasants, a rag of colts, a cast of hawks, a cete of badgers, a herd of cranes, a leap of leopards, a rout of wolves, a sord of mallards, a wisp of snipe, a doylt of tame swine, a gaggle of geese, a group of ganders, a troop of monkeys, a harras of horses, a company of widgeon and a kennel of raches'"

### NOMENCLATURE OF ANIMAL GROUPS

It seems strange that the cause of a common cold—the most common of all forms of illness—should defy detection. Scientists are fairly well igreed that it is infectious, and announcements have frequently been made that its virus has been discovered. One of the latest innouncements is that contained in the November seventeenth issue of the New York Times, which derived its in formation from the Proceedings of the Society for Experimental Biology and Medicine. This report describes experiments conducted during the last year in the laboratories of the Johns Hopkins Medical School, upon a group of volunteers like Imics says.

'The report was made by Di James A Doull formerly of the Johns Hopkins medical faculty and now Professor of Pieventive Medicine in Western Reserve University, and Dr Perrin H Long, now of the Johns Hopkins faculty They mide no prophecies is to whit mity result from their experiments

'The Hopkins scientists are continuing their work on the cold problem. The John Jacob Abel Fund of \$150,000, given to the Chemical Foun dation in honor of Di. Abel, the Professor of Pharmacology at Johns Hopkins, furnishes perminent financial support for the work.'

### OYSTER EATING

This Journal of September first, page 1052, described a meeting of the Oyster Growers and Dealers Association of North America, Inc., at which the production and marketing of oysters were discussed, especially the sanitary and health phases of the problems. The earnest efforts of the growers to make their product reliable in all respects has been reassuring to the people, and at the same time profitable to the producers, as is shown by the following editorial item from the New York *Times* of November 13th:

"Now that we are well into the oyster year, it is of interest to note that the latest Federal statistics show that oysters are more in demand than ever. The Department of Commerce, which is always serious about their data and culture, states that 90 per cent of all the housewives of the country are accustomed to include them in the family menu.

"If that is true, old habits must be changing. Save in an occasional can, the oyster used not to break very often into the inland domestic circle. It was reserved for special, and usually public occasions.

"Probably modern methods are responsible for the change. Better refrigerating systems have increased the oyster radius. More precautions are taken nowadays, both by the Federal and the State authorities, to prevent pollution."

The oyster has come to have an importance in medicine in these days of feeding liver for pernicious anemia, for half of an oyster consists of liver. People generally, as well as many doctors, do not know that the dark part of an oyster, or clam, or mussel, is not the intestine, but is the liver similar to that of the warm-blooded animals.

### PREVENTION OF COLDS IN CORNELL UNIVERSITY

The New York *Herald Tribune* of November 3 contains the following description of the experiments, or rather demonstrations, of the prevention of colds among Cornell students at Ithaca:

"Encouraged by the results achieved last year in virtually eliminating the annual epidemic of colds among students, Dr. Dean F. Smiley, medical adviser at Cornell University, announced today that a further extension of this movement will be made this year with the establishment of cold-prevention classes. So far as is known, this is the first time that any university has organized as comprehensive a plan for improving student health. Last year the ultra-violet ray solarium which was in operation at Cornell was credited with a 40 per cent reduction in the number of colds among those taking the treatment.

"Investigations over a period of years indicate that approximately 25 per cent of Cornell students

are definitely cold susceptible. All students who fall in this category will be afforded an opportunity to maintain their health during the period of the year when they would be normally subject to colds.

"With the conviction that controlling colds among the cold-susceptible group will go a long way toward preventing cold epidemics among the whole student body, the medical adviser's offices for men and women are organizing 'cold-prevention classes' this fall which it is hoped will be joined by the majority of those students who habitually have colds four or more times a year. The treatment provided in these 'cold-prevention classes' will include weekly ultra-violet light baths, alkalinization, instruction regarding diet and ventilation, and in selected cases a special study of the nose and throat and the use of a catarrhal vaccine."

### TEAR GAS IN CIVIL LIFE

Doctors will have to study the effects of war gases if they are to be adopted into civil life, as is indicated by the following item from the New York *Times* of October 14:

"Engineers of the Federal Laboratories, Inc., of Pittsburgh have just completed the installation of a tear gas device in the Bank of Huntington, we ording to an announcement by Douglass Conk-

lin, president of the bank. The equipment is so installed that it can be automatically discharged at the time of a hold-up, filling the entire bank lobby in two-fifths of a second with a gas that will compel every one in the lobby to close their eyes. While the gas is harmless in its effects, it is claimed no one can remain in the institution long after it is released."

## BOOK REVIEWS

10xxii. SURGERY Breed on a Study of the Anatomy By Roffer H 1 lowler M D. Quarto of 288 pages illustrated Philadelphia I A Davis Company 1930 Cloth \$1000

This book represents the author's effort to give to the medical profession a comprehensive treatise on the surgery of the tonsil. The anatomical basis for the surgery is stressed and the discovery of a very small ren muscle is made known

This new muscle the tonsillepharyngeus has been overlooked by most men because they have not delved into the minute anatomy of the tonsil and peritonsillar structures, perhaps also because the throat presented an unbroken tharyngeal facia covering the cradle from which the tonal was removed. So that there did not appear any need for special study to a vast number of men who do excellent tonsillectomy work. The book lists several operations which uppeil to the author. It is to be regretted that numerous operations which have tound f vor with large sections of the specialists have not been included in the work

The volume is of value to the beginner in the specialty of Nose and Threat who wishes to become acquanted with the unitomy of the toroil and the peritonsillar area. There is a time collection of drawings some of which are in color this is a feature

The author and his publisher are to be congratulated up in the keneral makeup of the book its fine binding the good paper and the arrangement of the material It is light that later editions will pay scenter attention to the historical side of tensillectemy MCM

A JENT ROOK OF PSYCHIATRY BY D. K. HINTERSON M.D. and R. D. GHITTSTIF M.D. 2nd I ditton. Octavo of 526 pages. London und New York Oxford University Press 1930. Cloth \$5.50. (Oxford Medical Publications )

The authors have written a book that stinds midway I ctween the limit itions that are mentably to be found in a mere outline of psychiatry and the exhaustive discussions that would naturally be obtained in a monograph in which the individual disorders are presented mental disturbance is infinitely described and the dynamics of each adequately treated. Thus a complete con cept of the various mental deviations is obtained

\ chapter is devoted to the symptomatology and psychopythology. The material is clearly and logically arranged. The laterary style is such that one can read the contents with little effort and much pleasure

The disorders of the mind are presented so is to sharply call attention to the concept that in mental devithens we are dealing with problems of the individual is a whole rather than that with one of his symptoms It is an approach that leads to an intelligent under standing of conduct disturbances

One chapter is relegated to the relation of psychiatrs and the law. The contents are such that the book should unite readily lend itself to both of the learned profes sions to law and medicine. G I SWETLOW

Applied Physiology P3 Samson Wright MD Third Edition Octavo of 552 pages illustrated Fondon and New York Oxford University Pre s 1929 Cloth \$5.50 (Oxford Medical Publications)

Three editions in four years testify to the value of this Look. It gives an account of all the main extended physi I gv in its application to disease

I come more and more important to the medical man as i firm foundation for his studies of the diseased organ Without a thorough I nowledge of the normal and the viriations which can take place in disease rational dragnosis and therapeutics become unsatisfactory book although small gives a comprehensive study of applied physiology and is the best book of its kind The present edition has been brought up to date in all the recent advances in physiology. It should be value able able to the practitioner and student and will well reward the time spent in its perusal

J HAMILTON CRAWFORD

SURGERY AT THE NEW YORK HOSTITAL ONT HUNDRED YEARS AGO By Duckner II Pool and Frank J McGow vn 12mo of 188 pages illustrated York Paul B Hoeber Inc 1930 Cloth, \$150

This is an interesting contribution to the lustory of surgery. The data come principally from a surgeral register preserved in the Hospital Archives. One can n t help lama impressed by the said state of surgery as Lite as the beginning of the 19th century

It that time there was no stethoscope no thermometer t ray of anesthesia. Hypodernic medication was un known but venesection was employed for almost every thing—the rule seemed to be when in doubt resort to lood letting frequently and plentifully. There was plenty of alcohol in the form of whiskey

Irindy wine-even gin

bread and milk poultice 'to induce an ulcer to sup the records give the gruesome details of purate kindly a thigh amputation on a boy ten years old without

Those familiar with present day surgery will enjoy reading this volume and appreciate the marvelous ad vances of the surgical art in the past century

F B D

HE NEW LAGILITION ZOOGENESS BY AUSTIN H CLARK Octave of 297 pages illustrated Baltimore The Williams and Williams Company, 1930 Cloth THE NEW LIGHTION ZOOGENISIS \$3 00

Doctor Clark has written an colightening treatise on the relations of us humans to the various creatures living among us. That man did not always dominate the earth is his contention. He maintains that in the geo logic age just past a great array of different mainmals were our superiors. It is natural therefore to speculate as to who will succeed in in as the dominating influence in the world's affairs

That various munds require physiological is well as structural alterations in response to environment is well known to physicians, but Dr Clark has well succeeded in printing a beautiful panorama of Nature's protean miracles and he has shown how they have all been designed on an orderly and definite plan

He does not inspire self confidence in his professional readers when he remaids us that from the physical view point man is relatively one of the least efficient of hving creatures

For these who wish to think of Man as merely part ct a greater Cosmos of life and dependent upon water similable weather soil veretation and animal life for his happiness and existence this book should serve as a selended contribution to the science of evolution

PAINTER KRIMSTS

Surgery of the Lung and Pleura. By H. Morriston Dayles, M.A., M.D. Octavo of 355 pages, illustrated. London and New York, Oxford University Press, 1930. Cloth, \$8.00. (Oxford Medical Publications.)

1442

This volume is a very acceptable addition to the few works dealing exclusively with thoracic surgery. The author, through his close association with this type of surgery, has been able to present the subject in a brief, yet thorough manner, so that the book should prove a valuable addition to the library of the general surgeon.

RALPH F. HARLOE.

DEMONSTRATIONS OF PHYSICAL SIGNS IN CLINICAL SURGERY. By HAMILTON BAILLY, F.R.C.S. (Eng.). Second Edition. Octavo of 268 pages, illustrated New York, William Wood & Company, 1930. Cloth, \$6.50.

Accurate diagnosis is the essential prerequisite for successful treatment. Thorough and detailed physical examination is an essential prerequisite for accurate diagnosis,

Hamilton Bailey, in this little volume of his, has given every student and graduate physician an opportunity to perfect himself in the art of physical examination. The volume is extremely well illustrated and is crowded with valuable pointers for procuring and evaluating physical signs. A most complete index facilitates finding the desired information. It is a volume no student of surgery, graduate and undergraduate, should omit studying closely.

GEO. WEBB.

NASAL CATARRII. By W. STUART-LOW, F.R.C.S. (Eng.). 12mo of 84 pages, illustrated. London, H. K. Lewis & Company, Ltd., 1930. Cloth, 5/-.

This small pocket sized booklet of 82 pages, presents the subject of nasal infections which are commonly termed, Catarrh, in a very simple and concise manner. The various forms of sinusitis are touched upon and some of the writer's original ideas and operations are cited.

It is so simple in its language and yet so accurate scientifically, that it makes a suitable book for the physician to recommend to those of his patients who are desirous of knowing something about the nose and its troubles.

M. C. M.

THE BABY'S FIRST TWO YEARS. By RICHARD M. SMITH, A.B., M.D. New and revised Edition. 16mo of 159 pages, illustrated. Boston and New York, Houghton, Mifflin Company, 1930. Cloth, \$1.75.

Of the many books on this subject, this is one of the best. Doubtless the reviewer says so because the writer expresses his views in language which he considers clear and satisfactory. Any criticisms are too minor to make. It is cheerfully recommended for the purpose in-

tended. W.D.L

THE PSYCHIATRIC STUDY OF PROBLEM CHILDREN. BY SANGER BROWN, II, M.D., and HOWARD W. POTTER, M.D. (Published by the New York State Department of Mental Hygiene.) Octavo of 152 pages. Utica, State Hospitals Press, 1930.

This volume, rather than a text book on i subject, is an examination manual.

It consists largely of a very complete list o things to be sought in anamnesis and physical and lexaminations, with a little suggestion of the disposion to be made of a case.

be made of a case.
For its purpose, its use by members of the State Department of Mental Hygiene and similar groups it would must work work but, for a long while, the examiners it is recommended.

W. D. L.

CANCER OF THE BREAST. By WILLIAM CRAWFORD WHITE, M.D., F.A.C.S. 16mo of 221 pages. New York and London, Harper and Brothers, 1930. Flexible leather, \$3.00. (Harper's Medical Monographs.)

Early treatment is the keynote of this work, with the proper types of therapy clearly defined. Etiology, symptomatology and diagnosis are thoroughly presented, and operative treatment set forth. X-ray and radium methods are lucidly described. Pathologic technic receives due consideration. Fourteen illustrations accompany the admirable text. These Harper monographs represent a very high type of publication. A. C. J.

REFLEX ACTION: A study in the History of Physiological Psychology. By Franklin Fearing, Ph.D. Octavo of 350 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1930. Cloth, \$6.50.

An excellent work. The book is essentially a thorough survey of the history of the reflex action. The author has performed an intensive historical research, listing

554 references in the Bibliography.

This type of book is such as will prove necessary to the student of psychology, as herein he will find very detailed and lengthy quotations from the works of all pioneers in the study of this question. It is bound to have a limited circulation, but will prove very valuable to an earnest student of psychology or physiology.

HAROLD R. MERWARTH

N. Y. State J. M. December 1, 1930

TRAUMA, DISEASE, COMPENSATION: A Handbook of Their Medico-Legal Relations. By A. J. Fraser, M.D. Octavo of 524 pages. Philadelphia, F. A. Davis, Company, 1930. Cloth, \$6.50.

This work deals with medico-legal relations. It discusses compensation work very thoroughly, with particular reference to the causes of disease and disability. It should aid the practitioner greatly in distinguishing between what part of disability is caused by injury and what part by previous disease. The effect of trauma in causing subsequent disease is well presented, with the authoritative views of experts. To those who are doing compensation work this book should be highly useful.

NORMAL FACTS IN DIAGNOSIS. By M. COLEMAN HARRIS, M.D., and BENJAMIN FINESILVER, M.D. Octavo of 247 pages, illustrated. Philadelphia, F. A. Davis Company, 1930. Cloth, \$2.50.

One must know the normal very well indeed before one can discern pathologic signs. This book is concerned with normal findings. The idea is an excellent one and the authors have done their work well. Methods of examination are carefully expounded; thus transillumination of the nasal sinuses is illustrated in colors. Urinalysis, blood examinations, basal metabolism, etc., are well presented. Excellent for practitioner and student alike.

A. C. J.

Uterine Tumors. By Charles C. Norris, M.D. 16mo of 251 pages, illustrated. New York and London, Harper and Brothers, 1930. Flexible leather, \$3.00. (Harper's Medical Monographs.)

This monograph will be fully as valuable to the general practitioner, and to those who desire a quick review of the subject, as it will be to the gynecologist. In a comparatively short space, the author has managed to give a short description of the etiology and pathology of the various forms of uterine tumors, and to emphasize their diagnostic features and the several tests necessary for diagnosis. He has clearly set forth many valuable aids in differential diagnosis.

Operative technique has largely been omitted, but the most satisfactory forms of operation with or without radium and x-ray are clearly indicated, together with their indications and contraindications. W. S. S.

BOOK REVIEWS

1443

VARICOSE VEINS With Special Reference to the Injection Treatment. By H. O. McPhieters, M.D. Second revised Edition Octavo of 233 pages, illustrated. Philadelphia, F. A. Davis Company, 1930. Cloth, 83.50.

The Second Edition of this monograph on Varicose Veins has been amplified by the addition of an entire chapter on the surgery of the Frendelemburg Test and its application to the varicose problem

The pathological findings, in following the injection treatment, have been studied and presented as an addition to the previous observations in the First Edition.

There is still retained the evidence of reversed circulation in the lower extremity in various vents. This evidence is not at all conclusive, although the author is

persuaded that it is.

The other changes are slight but of a constructive character, especially as regards the technique of treatment. The book is certainly a valuable asset to any physician, especially if he desires to employ the sclerosing method in the treatment of varicose vents.

ROBERT F. BARBER.

THE IMPROVED PROPHYLACTIC METHOD IN THE TREATMENT OF ECLAMPSIA. By PROF. W. STROGANOFF. Third Edition, revised and completed. (First English Edition.) Octavo of 154 pages. New York, William Wood and Company, 1930 Cloth, \$3.50.

Stroganoff's monograph on Eclampsia is a vivid account of the evolution of the treatment of this baffling and dangerous malady by the man who more than any one else has contributed a successful method of reductive the successful method of reductive the successful method of reductive the successful method of successful method of reductive the successful method of r

ing the mortality.

The brilliant results obtained by the author can be duplicated by anyone who will study this monograph carefully and follow the instructions which are given

clearly and in great detail

Like other notable advances in science, the method was not acquired in a day or a week. The author's struggle to give his treatment to the world, the criticism, misunderstanding and final triumph form one of the most interesting chapters of the book.

The text is rendered more interesting by the writer's quaint attempts to master the English idiom. He succeeds admirably in conveying his meaning in forcell, simple English.

F. B. D.

Modern Ofology. By Joseph Clarence Kfeler, M.D., F.A.C.S. Octavo of 858 pages, illustrated. Philadelphia, F. A. Davis Company, 1930.

In this volume, the author, who has spent twenty-five years or more in the active field of teaching, clinic, and hospital work, gives especially his own views and the treatment he has found most satisfactory. The work done by others is reviewed and at the close of each subject there is a valuable bibliography.

In some places the text might be a little clearer. The illustrations and plates, most of them original, are good. Valuable chapters are: "Otology in Children," "Deafmutism" and "The Medico-legal Aspect of Otology." These are subjects not usually given a prominent place in text-books.

It is a book written especially for the student beginning post-graduate work in the field of Otology,

J. W. D.

A SHORTER SURGERY: A Practical Manual for Senior Students. By R. J. McNehll Love, M.B., M.S., F.R.C.S. Second Edition. Octavo of 371 pages, illustrated New York, William Wood and Company, 1930. Cloth, \$500.

Short cuts in surgery, as well as elsewhere in science and art, are usually of little value. The Initiated seldom, if ever, resorts to the condensed manual because of its paucity of details of which he is in need. The Uninitiated, the undergraduate student, who naturally likes to get a bird's-eye view of his subject and who there

considers the "short-cut" text-book a boon, is apt to misconstrue the skeletal information offered and to develop erroneous conceptions.

With these limitations understood Love's Shorter Surgery should be highly lauded. The author has succeeded in giving a great deal of well systematized information without saterificing either the scientific approach to his subject or the essential details — Geo. Wrist.

IMMUNITY IN INFECTIOUS DISFASES: A Series of Studies. By A. Beserdka. Authorized translation by Hermer Child, M.R.C.S. (Eng.), L.S.A. Octavo of 364 pages. Baltimore, The Williams and Wilkins Company, 1930.

The author presents in this volume the results of a series of research studies in immunity in the infectious diseases.

The book contains fifteen chapters dealing with the various aspects of this subject and beginning appropriately with a consideration of the various theories of immunity, and with brief reference to some current misconceptions.

Then follows a report of investigations relative to the bacterial power of the leucocytes, the question of bacterial hemolysins, the specificity of the various streptococci, and of streptococcus antitoxin. This is succeeded by a consideration of various microbial endotoxins and of vaccination by sensitized viruses. There is considerable space devoted to the important subject of the function of the skin in infection and immunity, and to the theory, experimental basis and statistical and clinical results of vaccination by the cutaneous and buc-

These studies carried out at the Pasteur Institute in the past thirty years represent a contribution of the most fundamental and utmost importance to the science of immunology.

Joseph C. Reday,

THE CHILD'S HEREDITY. By PAUL POPENOE. Octave of 316 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1929. Cloth, \$200.

An excellent work which well fulfills its intended purpose of so presenting this diversified subject that it can be appreciated readily by the average father or rother. The subject matter is presented in a very clear and readile fashion. Ones interest is maintained throughout the advantage of considering individual phases in feature is the detailed consideration of epileps and mentant of the detailed consideration of epileps and menductioning by anxious parents.

The author has made free use of the large total of 418 references, a really excellent bibliography, the utilication of which imparts an atmosphere of authority according to HAROLD R. MERWARTH.

Gynecology for Nurses. By George Gellings, M.D. and London, W. B. Saunders Company, 1930, Cret.

This is a new volume based on the author cological lectures to nurses. He has had a wit constitution of general subject in a clear, concise and simple manners to book for nurses.

Part I deals with the female genital engine and disease, while Part II considers a gynecological nursing.

The author has laid annually a grant of the surface of the surfa

gynecological nursing.

The author has laid great stress on more than half the book is devoted the gynecological patients.

A short, but most thought the gynecological patients.

Thought the gynecological patients a short, but most the gynecological patients.

Surgery of the Lung and Pleura. By H. Morriston Davies, M.A., M.D. Octavo of 355 pages, illustrated. London and New York, Oxford University Press, 1930. Cloth, \$8.00. (Oxford Medical Publications.)

This volume is a very acceptable addition to the few works dealing exclusively with thoracic surgery. The author, through his close association with this type of surgery, has been able to present the subject in a brief, yet thorough manner, so that the book should prove a valuable addition to the library of the general surgeon.

RALPH F. HARLOE.

DEMONSTRATIONS OF PHYSICAL SIGNS IN CLINICAL SUR-GERY. By HAMILTON BAILEY, F.R.C.S. (Eng.). Second Edition. Octavo of 268 pages, illustrated New York, William Wood & Company, 1930. Cloth, \$6.50.

Accurate diagnosis is the essential prerequisite for successful treatment. Thorough and detailed physical examination is an essential prerequisite for accurate diagnosis

Hamilton Bailey, in this little volume of his, has given every student and graduate physician an opportunity to perfect himself in the art of physical examination. The volume is extremely well illustrated and is crowded with valuable pointers for procuring and evaluating physical signs. A most complete index facilitates finding the desired information. It is a volume no student of surgery, graduate and undergraduate, should omit studying closely.

GEO. WEBB.

NASAL CATARRH. By W. STUART-LOW, F.R.C.S. (Eng.). 12mo of 84 pages, illustrated. London, H. K. Lewis & Company, Ltd., 1930. Cloth, 5/-.

This small pocket sized booklet of 82 pages, presents the subject of nasal infections which are commonly termed, Catarrh, in a very simple and concise manner. The various forms of sinusitis are touched upon and some of the writer's original ideas and operations are cited.

It is so simple in its language and yet so accurate scientifically, that it makes a suitable book for the physician to recommend to those of his patients who are desirous of knowing something about the nose and its troubles.

M. C. M.

THE BABY'S FIRST TWO YEARS. By RICHARD M. SMITH, A.B., M.D. New and revised Edition. 16mo of 159 pages, illustrated. Boston and New York, Houghton, Mifflin Company, 1930. Cloth, \$1.75.

Of the many books on this subject, this is one of the best. Doubtless the reviewer says so because the writer expresses his views in language which he considers clear and satisfactory. Any criticisms are too minor to make. It is cheerfully recommended for the purpose intended.

W. D. L.

THE PSYCHIATRIC STUDY OF PROBLEM CHILDREN. BY SANGER BROWN, II, M.D., and HOWARD W. POTTER, M.D. (Published by the New York State Department of Mental Hygiene.) Octavo of 152 pages. Utica, State Hospitals Press, 1930.

This volume, rather than a text book on it subject, is an examination manual.

It consists largely of a very complete list o things to be sought in anamnesis and physical and i aminations, with a little suggestion of the disposion to be made of a case

be made of a case.

For its purpose, its use by members of the State Deartment of Mental Hygiene and similar groups it would must work work with book in hand or they will miss items.

W. D. L.

CANCER OF THE BREAST. By WILLIAM CRAWFORD WHITE, M.D., F.A.C.S. 16mo of 221 pages. New York and London, Harper and Brothers, 1930. Flexible leather, \$3.00. (Harper's Medical Monographs.)

Early treatment is the keynote of this work, with the proper types of therapy clearly defined. Etiology, symptomatology and diagnosis are thoroughly presented, and operative treatment set forth. X-ray and radium methods are lucidly described. Pathologic technic receives due consideration. Fourteen illustrations accompany the admirable text. These Harper monographs represent a very high type of publication. A. C. J.

REFLEX ACTION: A study in the History of Physiological Psychology. By Franklin Fearing, Ph.D. Octavo of 350 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1930. Cloth, \$6.50.

An excellent work. The book is essentially a thorough survey of the history of the reflex action. The author has performed an intensive historical research, listing

554 references in the Bibliography.

This type of book is such as will prove necessary to the student of psychology, as herein he will find very detailed and lengthy quotations from the works of all pioneers in the study of this question. It is bound to have a limited circulation, but will prove very valuable to an earnest student of psychology or physiology.

HAROLD R. MERWARTH

TRAUMA, DISEASE, COMPENSATION: A Handbook of Their Medico-Legal Relations. By A. J. Fraser, M.D. Octavo of 524 pages. Philadelphia, F. A. Davis, Company, 1930. Cloth, \$6.50.

This work deals with medico-legal relations. It discusses compensation work very thoroughly, with particular reference to the causes of disease and disability. It should aid the practitioner greatly in distinguishing between what part of disability is caused by injury and what part by previous disease. The effect of trauma in causing subsequent disease is well presented, with the authoritative views of experts. To those who are doing compensation work this book should be highly useful. A. C. J.

NORMAL FACTS IN DIAGNOSIS. By M. COLEMAN HARRIS, M.D., and BENJAMIN FINESILVER, M.D. Octavo of 247 pages, illustrated. Philadelphia, F. A. Davis Company, 1930. Cloth, \$2.50.

One must know the normal very well indeed before one can discern pathologic signs. This book is concerned with normal findings. The idea is an excellent one and the authors have done their work well. Methods of examination are carefully expounded; thus transillumination of the nasal sinuses is illustrated in colors. Urinalysis, blood examinations, basal metabolism, etc., are well presented. Excellent for practitioner and student alike.

A. C. J.

UTERINE TUMORS. By CHARLES C. NORRIS, M.D. 16mo of 251 pages, illustrated. New York and London, Harper and Brothers, 1930. Flexible leather, \$3.00. (Harper's Medical Monographs.)

This monograph will be fully as valuable to the general practitioner, and to those who desire a quick review of the subject, as it will be to the gynecologist. In a comparatively short space, the author has managed to give a short description of the etiology and pathology of the various forms of uterine tumors, and to emphasize their diagnostic features and the several tests necessary for diagnosis. He has clearly set forth many valuable aids in differential diagnosis.

Operative technique has largely been omitted, but the most satisfactory forms of operation with or without radium and x-ray are clearly indicated, together with their indications and contraindications. W. S. S.

MEAD'S

VIOSTEROL

in Oil, 250 D

originally called Acterol

# ··· EFFECTIVE ··· OCTOBER 1st, 1930

Mead's Viosterol in Oil is now designated 250 D because, in accordance with the provisions of the Wisconsin Alumni Research Foundation, we are now assaying the product by the Steenbock method. Before October 1, 1930, this same product was assayed by the McCollum-Shipley method and was designated 100 D. This was done in the belief that this method gave results comparable with that prescribed by the Wisconsin Alumni Research Foundation for its licensees. It was discovered, however, that when assayed by this method the potency of the product was virtually 250 D in comparison with products standardized by the Steenbock method.

Mead's Viosterol in Oil, 250 D (Steenbock method)—in normal dosage—is clinically demonstrated to be potent enough to prevent and cure rickets in almost every case. Like other specifics for other diseases, larger dosage may be required for extreme cases. It is safe to say—based upon extensive clinical research by authoritative investigators (reprints on request)—that when used in the indicated dosage, Mead's Viosterol in Oil, 250 D is a specific in almost all cases of human rickets, regardless of degree and duration, as demonstrated serologically, roentgenologically and clinically.

The change in Mead's Product is in designation only—not in actual potency. Mead's Viosterol in Oil, 250 D—in proper dosage—continues to prevent and cure rickets.

### INCOMES OF PHYSICIANS IN WEST VIRGINIA

The November issue of the West Virginia Medical Journal contains a report on the questionnaire that was sent in October to each one of the 1500 physicians practicing in West Virginia. (See N. Y. STATE JOURNAL OF MEDICINE, Oct. 15, page 1267). Seventy-two per cent of the physicians responded. The figures given in the report are those which would apply to 100 per cent of the physicians estimated on the basis of the 72 per cent who replied. The table shows the incomes of the several classes of practitioners.

profession is \$28,000 a year, and there are two physicians who make that amount. It might be interesting to point out that one is a general practitioner, the other a surgeon. The smallest net income is \$420 a year, listed by a general practitioner in a rural district who has been in active practice for twenty-four years. The country doctor, however, does not fare as badly as one might think. The average net income of the rural general practitioner is \$4,396 a year, and the average net income of the urban general

TYPE OF PRACTICE	Average Income of Each Doctor		TOTAL INCOME OF ALL DOCTORS		PER CENT	TOTAL OF CHARITY
	Gross	Net	Gross	Net	Collections	Work
General Practice	\$8,005.86	\$5,235.26	\$8,334,105	\$5,449,908	77	\$958,941
Surgery	14,783.33	9,864.50	1,463,550	976,587	75	208,290
Eye, Ear, Nose and Throat	12,454.34	7,664.61	971,439	597,840	92	172,470
Internal Medicine	10,388.00	7,811.60	492,600	351,522	75	31,164
Pediatrics	14,300.00	5,812.50	231,000	139,500	76	42,900
Urology,	7,522.00	6,428.57	187,500	135,000	76	22,566
Miscellaneous	8,391.58	6,287.82	904,688	654,556	87	117,033
GRAND TOTALS	\$9,580.60	\$6,414.43	\$10,455,162	\$8,314,923	79	\$1,548,864

Commenting on the report, the Journal says:

"The surgeons are the highest paid of any branch of the profession, averaging \$9,864.50. X-ray specialists are the lowest paid, averaging the dermatologists, averaging, \$9,800; the obstetricians at \$9,700; the eye, ear, nose and throat specialists at \$7,664.61; the internists at \$7,811.60; the urologists at \$6,428.57; the pediatricians at \$5,812.50; the orthopedists at \$5,990, and the general practitioner at \$5,235.26. Of the smaller groups practicing special branches of medicine are the proctologists at \$7,500, the psychiatrists at \$4,100, and the public health workers at \$3,933. The average ine Stat of the "contract" doctor is the similar groups it womban that of the genk in hand or they will miss items. practitioner is \$6,528.64 a year. The "contract" doctor was figured separately, showing the average net contract to be worth \$4,166 a year.

"In many cases the younger doctors who had \$4,000 a year. Between these two extremes come been in practice for only six or seven years were making as much as or more than doctors who had spent from twenty to thirty years in the practice of their profession. It was quite clear, however, that the newer graduates just out of college were having a hard time making both ends meet. It was estimated that at least three years were required for the young doctor to get a foothold in the community or city in which he set up an independent practice. There were, of course, exceptions to this rule.

"It has been estimated by many large adver-(Continued on page 1446-adv. xii)

tising houses that the maximum return on a professional questionnaire was 50 per cent, while the average return was lower than that. The members of the West Virginia State Medical Association returned 72 per cent of their questionnaires, and a few are still trickling in from day to day."

"The survey conducted by the West Virginia State Medical Association is the first attempt ever made to secure an exact estimate of the costs of medical care in this state and one of the first surveys of its kind ever made in this country."

### LEGISLATIVE SESSIONS IN TEXAS

The October issue of the Texas State Journal of Medicine has an editorial on a proposed change in the Constitution in the sessions of the Legislature, and says:

"The first amendment would provide for a regular legislative session each two years, of one hundred and twenty days duration, the session to be divided into three periods. The first period, thirty days, would be taken up exclusively with organization, emergency legislation and in the filing of bills.

"There would be ample time for constituents of the several legislators to make inquiries as to the bills they have introduced, and doubtless many foolish measures would be withdrawn after introduction, before the period of

committee hearings.

"But the real benefit of the proposal would be the opportunity given in the second period, also thirty days, for appearing before committees in opposition to or in support of, the various measures introduced during the first Those of us who have indulged in this very embarrassing pastime remember the difficulty experienced in endeavoring to present argument in connection with some intricate measure having a scientific bearing, in an allotment of time, of say, one hour. It cannot be done. The advantage in such a situation as this is to the fellow who has something to slip by somebody. In other words, there isn't time to find the nigger in the woodpile. Neither is there time to present the advantages of some measure which is necessarily voluminous and intricate. In this connection, we recall the difficulties experienced in the presentation of such health measures as the sanitary code, and the board of health bill.

"The third period, which is sixty days instead of thirty, is the period of debate. At the present time there is practically no debate in the legislature, except upon measures conceded to be of major caliber. There are many im-

portant measures coming before the legislature from time to time which should be debated at length, which may not appear to be important because they are brief and to the point. Some legislator determines that there is something wrong and tries to get at it, but he is taken off his feet by the unsympathetic attitude of his colleagues, an attitude which would not prevail if it were not that expedition is necessary to get to some pet measure further on down the line. In other words, deliberation is not possible except when there is time for it, and certainly our legislative procedures should be deliberate.

"The average period of time the legislature has been in session during the past fourteen years, is one hundred and thirteen days, perhaps one-half of which has been wasted be-

cause of hurry."

### WORKMEN'S COMPENSATION IN OHIO

The November number of the Ohio State Medical Journal contains an account of a Workmen's Compensation conference similar to that held in New York State on October 22 (See the New York STATE JOURNAL OF MEDICINE, November 15, page 1380). The account says:

"Many questions relative to the handling and reporting of medical and surgical cases compensable under the Ohio Workmen's Compensation Law and mutual problems of the medical profession and the State Industrial Commission arising from administration of the compensation law were discussed at a dinner meeting of the Medical Economics Committee of the Ohio State Medical Association, its subcommittee on workmen's compensation, the Policy Committee of the State Association, members of the State Industrial Commission, its department heads and officials of the State Department of Industrial Relations, held on October 1, in Columbus.

"The desirability for a continuance of the mutual spirit of cooperation and friendly relationship that exists between members of the State Industrial Commission, its various divisions, and the medical profession of Ohio generally was the keynote of the conference.

"Practically all those who took part in the discussion voiced the opinion that in many ways the Ohio Compensation Law is superior to the compensation laws of other states and that in general it is more satisfactory to all groups and individuals affected by it."

But the Commission has its troubles as is

shown by the following incidents:

"Records of the Commission reveal several

(Continued on page 1450-rvi)

# What about taste?

Do you have to apologize for the taste of the medicines you prescribe? Or do your patients still believe innocently that the medicine must be bitter to be efficacious?

Agarol the original mineral oil and agaragar emulsion with phenolphthalein, is for that up to date generation that wants its medicines in the proverbial "sugar coating."

No excuses are needed for its taste anymore than for its effectiveness. Agarol is exceptionally palatable without artificial flavoring. It flows freely from the bottle, and can be mixed with any liquid or soft food.

Just enough mineral oil to carry unabsorbable moisture to the intestinal contents, keep them soft, and so make evacuation easy and painless. By gentle stimulation of peristalsis, Agarol makes the result certain, and aids in reestablishing regular habits.

One tablespoonful at bedtime

-is the dose

Final decision on the true worth of Agare! rests with the physician. We will gladly send a twin package, withliterature, for trial.

AGAROL

Constipatio

(Continued from page 1448-adv. xiv)

cases where the attending physician has made himself liable to prosecution under the Anderson Law through the signing of fraudulent claims for injury or certification of inaccurate data.

"The record of one of these cases shows that a physician certified to an alleged operation for hernia, submitted a bill for the operation and was paid by the Commission which later learned, following examinations by other physicians, that such an operation had never been performed.

"A number of cases are on record at the Commission where claims were submitted, signed by the employe and the attending physician, where injuries were sustained 'outside' employment and therefore, were not compensable under the Workmen's Compensation Law. The law and the regulations of the Commission do not consider compensable any injuries incurred in going to and returning from work, unless transportation facilities are furnished by the employer and unless such injured employe was, at the time, under the control of or carrying out the instructions of the employer.

"Records of the Commission also show several instances where a physician has submitted a fee bill for services to patients who were never seen by him but where all the medical attention was rendered by a nurse or technician arrelated in the physician's offer.

cian employed in the physician's office.

"Another class of complaints that are largely due to the doctor's negligence are those received from injured workmen, asking why they have not received compensation for injuries received many weeks or months ago. In checking these kicks, we find that in some instances the physician has never filed certain reports necessary in adjudication of the case or that he has ignored the request of the Commission for more data or information on certain medical angles of the case.

"These are typical examples of some of the problems we face. For the most part, we have very little difficulty with the medical profession. The majority of doctors are doing splendid work and complying in every way with the rules and regulations laid down by the Commission. A little more cooperation and consideration by the few who are a bit trouble-some will aid in producing greater efficiency

in the office routine.

"Mr. Hedges also sounded a note of warning to the medical profession generally not to be taken in by the various so-called Industrial Service Bureaus' operating in the state and soliciting members of the medical profession and others for business, promising to collect bills before the State Industrial Commission on a commission basis. These agencies have no standing of advantage before the Commission and can do no more than the physician himself in hastening the payment of bills."

### COUNTY SOCIETY NEWS FROM MISSISSIPPI

The November issue of the New Orleans Medical and Surgical Journal, the organ of the Mississippi State Medical Association, as well as the Louisiana State Medical Society, has the following commendatory editorial on the news pages contributed from Mississippi:

"The Secretaries of the various Parish Societies of the Louisiana State Medical Society are invited to look over the splendid section that is being edited by Dr. Lippincott, and which contains so much information concerning physicians in the State of Mississippi. This section is a real tribute to the Editor, who has labored long and hard in order to get the Secretaries of County Medical Societies of the State of Mississippi, as well as the members of the Mississippi, State Medical Association, interested in submitting news items for publication in the Journal. It is only by the earnest cooperation and help of these County Society Secretaries that Dr. Lippincott has been enabled to get together so much material for the Mississippi Section of the Journal. He has done this by a personal appeal and by written requests."

The Mississippi news section fills seven pages of the Journal. An item read before the "East Mississippi Four-County Society" was as follows:

"Dr. Felix J. Underwood, The Executive Officer of the Mississippi State Board of Health, discussed the awful death rate among the doctors in Mississippi during the past nine months. There have been 43 deaths and over 50 per cent died with either acute heart attacks or cardio-renal disease. This gives us something to think about, especially those of us who are going into the fifties. We all need rest, relaxation, and less responsibilities." I have been over the state considerably during the past six months, and it makes my heart ache to see the men breaking as they are now breaking. Why can't they take the same advice that they give their patients?"

(Continued on page 1453-adv. xix)

(Continued from page 1452-adv. xviii)

Another item described a public session in

connection with the society:

"After the scientific program was disposed of, the ladies of the Twentieth Century Club of this little city were the guests of this meeting, and they listened very intently to the paper of the writer on 'Organized Medicine,' and to the paper of Dr. Felix J. Underwood on 'Public Health Work.' If every town in the state had such active women in public health matters, our health programs would go over without any question, and our death rate from preventable diseases would be practically nil. These good women have taken the most advanced step and have had a Wassermann test made on every cook in this town, and those who were infected were treated, and today in the town of Durant there is not a cook who shows a positive Wassermann test. This is great work and I hope it will not be long before every city and town in the state takes up this work. I am especially grateful to the doctors of this society for the many courtesies shown me at this meeting."

The following items are from Jackson

County:

"Nothing has happened in society work in Jackson County since June. At that time we had a good meeting with Dr. Toulman Gaines of Mobile making a most practical and beneficial talk on 'Skin Troubles That Worry the General Practitioner.' We expect the December meeting to be better than we have been having.

"I hear that Dr. S. B. McIlwain will do post-

graduate work in Memphis soon.

"The new Jackson County Hospital will be finished at an early date and will be ready for

patients by November 15.

"No doctor has been sick, died, moved, got married nor had a baby. Some of them may be getting rich, but if they are they keep it J. N. RAPE, Secretary. hidden."

### VENEREAL DISEASE CASE REPORTS IN WASHINGTON

The Washington State method of reporting venereal diseases is described in the following editorial in the October issue of Northwest Medi-

"Doctors of Washington are neglecting one very important condition,—that venereal diseases are by law reportable, as are smallpox, diphtheria, and other infectious diseases. The report is made by a number and not by name. The physician withholding the name is legally held responsible for the patient continuing under treatment until well. If the patient discontinues treatment

## do you prescribe or recommend Cod Liver Oil by Name?

If you want your patients to take Nason's Palatable Norwegian Cod Liver Oil, you should prescribe or recommend it by name.

By so doing you protect your patient against the possibility of getting inferior or untested commercial oils.

The clarity and purity of Nason's, its pleasant taste and high vitamin potency, are your assurance that in every case where Nason's is prescribed it will please and benefit your patient.

# High Vitamin Potency Plus + Palatability

The vitamin potency of Nason's Palatable Norwegian Cod Liver Oil is warranted to be not less than

1000 Vitamin "A" units
per gram and not less than
150 Vitamin "D" units

per gram. Each lot is biologically tested.

"Mr. Hedges also sounded a note of warning to the medical profession generally not to be taken in by the various so-called 'Industrial Service Bureaus' operating in the state and soliciting members of the medical profession and others for business, promising to collect bills before the State Industrial Commission on a commission basis. These agencies have no standing of advantage before the Commission and can do no more than the physician himself in hastening the payment of bills."

## COUNTY SOCIETY NEWS FROM MISSISSIPPI

The November issue of the New Orleans Medical and Surgical Journal, the organ of the Mississippi State Medical Association, as well as the Louisiana State Medical Society, has the following commendatory editorial on the news pages contributed from Mississippi:

"The Secretaries of the various Parish Societies of the Louisiana State Medical Society are invited to look over the splendid section that is being edited by Dr. Lippincott, and which contains so much information concerning physicians in the State of Mississippi. This section is a real tribute to the Editor, who has labored long and hard in order to get the Secretaries of County Medical Societies of the State of Mississippi, as well as the members of the Mississippi, State Medical Association, interested in submitting news items for publica-tion in the Journal. It is only by the earnest cooperation and help of these County Society Secretaries that Dr. Lippincott has been enabled to get together so much material for the Mississippi Section of the Journal. He has done this by a personal appeal and by written requests."

The Mississippi news section fills seven pages of the Journal. An item read before the "East Mississippi Four-County Society" was as follows:

"Dr. Felix J. Underwood, The Executive Officer of the Mississippi State Board of Health, discussed the awful death rate among the doctors in Mississippi during the past nine months. There have been 43 deaths and over 50 per cent died with either acute heart attacks or cardio-renal disease. This gives us something to think about, especially those of us who are going into the fifties. We all need rest, relaxation, and less responsibilities." I have been over the state considerably during the past six months, and it makes my heart ache to see the men breaking as they are now breaking. Why can't they take the same advice that they give their patients?"

(Continued on page 1453-adv. xix)

# "You can relieve coughs

# without opiates"

"... Prescribe, instead, the non-nar-cotic Kres-Lumin. It combines the expectorant effect of calcium cresol sulphonates with the marked sedative and antispasmodic action of Luminal and is very palatable."

RES-LUMIN is particularly indicated in acute bronchitis and the bronchial complications of influenza, pneumonia or measles; in chronic bronchitis and pulmonary tuberculosis, in laryngitis, whooping-cough and bronchial asthma.

The dose for adults is 2 to 3 teaspoonfuls three or four times daily; for children 1/2 to 1 teaspoonful.

Kres-Lumin is now supplied in 4 oz. and 8 oz. bottles.

(Continued from page 1456-adv. xxii) after will not exceed two and one-half dollars, and that this shall be held as a 'pot,' to be drawn for toward the end of the meetings. Each one registering will be given a card with a number, and a duplicate number will be placed in a hat at the time of the drawing. The first number drawn will receive two-thirds of the amount of the 'pot,' and the second number, the remaining third. If the numbers drawn are held by members who have left prior to the drawing, they will receive nothing, and a second number, or numbers, will be drawn. In order to win, one must be present when the numbers are selected. Assuming that one hundred and fifty are present at the Jacksonville meeting, it is readily seen that the winning numbers will warrant the boys in remaining until the end of the session."

### INFANTILE PARALYSIS IN MAINE

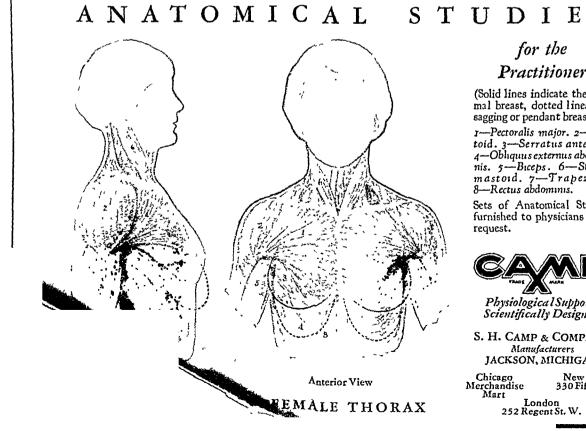

The October issue of the Maine Medical Journal contains the following editorial on infantile paralysis in the State:

"The recent incidence of infantile paralysis in Maine has been confined, for the most part, to Portland and Cumberland Counties. In number of cases, mortality and paralytic sequela the epidemic has run true to form. Relatively, to the communities and populations involved, it has not been as severe as that which occurred in New York in 1916.

"The action of Governor Gardiner in appointing Dr. Mortimer Warren, of Portland. Commissioner of Infantile Paralysis Control for our State, suggested by the Cumberland County Medical Society and after conference with representatives of the State Medical Association, again makes it possible for Maine to live up to her motto. No other New England State has as yet secured such support from its Chief Executive in attempting to combat this disease.

"For the first time in history a measure of insurance against the damage done by infantile paralysis is offered. It is for us to aid our Commissioner to establish the means of making this serum available in our State when needed.

"The Governor and our Association are alike anxious to co-ordinate in this matter and other health problems, existing agencies. In this case a new office has been created which is expected to secure better cooperation and coordinate the work of the doctor, the local and State Health Department, and other groups that should work together upon this problem for the common good. It in no way conflicts with and should supplement the proper work of all."

TONSILLITIS and particularly Follicular Tonsillitis is often stubborn and unyielding, with a great tendency to developing into the suppurative form.

# Tonsillitis in all its Forms

When it becomes apparent that suppuration is inevitable, the application of hot poultices is an old and accepted treatment.

Due to its thermogenetic potency and to its bacteriostatic action

# "Antiphlogistine"

induces an active hyperaemia in the affected area, which dilates and flushes the superficial capillaries, stimulates leucocytosis, and promotes the destruction of the bacteria.

Antiphlogistine has the advantage of being unfermentable and bacteriostatic, and will cling around the contour of the neck, when other applications are difficult to retain in place.

Write for sample and literature quoted from standard journals and text books.

THE DENVER CHEMICAL MI 163 Varick Street No.

# BACIDOPHILIS MILI

Approved by the A. M. A. Council on Pharmacy and Chemistry

There is only one way of convincing you just how reliable Cheplin's really is—and that is a trial in your next case of:

## Chronic Constipation or Mucous Colitis

Cheplin's B. Acidophilus is cultivated in milk, its best Medium (owing to the presence of 5% lactose), and this, combined with the careful selection of each strain of seed, produces a maximum concentration of viable B. Acidophilus. Hence, maximum results!

# Mellin's Food Adults and Children

MELLIN'S FOOD is a valuable aid in the management of the diet in any illness of children or adults where nourishment is an important part of the treatment, for the nutritive elements of which it is composed are readily digestible and capable of rapid absorption. In acute stomach upsets, in chronic intestinal disorders, in irritable conditions that involve the entire digestive tract and in febrile diseases, Mellin's Food may be used with much satisfaction.

A DIET generally acceptable to convalescents may be prepared from Mellin's Food, as well as bedtime nourishment for the aged, or to assist in inducing natural, restful sleep in the treatment of insomnia and many extremely nervous conditions.

MELLIN'S FOOD is particularly agreeable to the taste and patients take it readily, which is always of decided advantage whenever a restricted diet is necessary.

Formulas for preparing nourishment to meet varying conditions are set forth in a book which will be sent to physicians upon request, together with samples of Mellin's Food

### FURTHER ADVANCEMENT IN GYNECOLOGICAL DIATHERMY\*

By THOMAS H. CHERRY, M.D., NEW YORK, N. Y.

A<sup>N</sup> encouraging sign in the progress of medical science is the adoption of diathermy in the treatment of pelvic disorders.

In recent years this therapeutic agent is utilized on an increasing scale by the gynecologist, whereas previously, the physiotherapist had been the propagandist. This gradual change is as it should be, for the pelvic specialist is in a better position to more accurately make diagnoses and apply therapeutic relief.

The field of application in pelvic diseases is very large and the time limited to this paper is too short to undertake in detail a description of the entire subject. My remarks therefore will be limited to the progress made in the treatment of pelvic disorders by controlling the distribution of heat in medical diathermy and the destructive depth in coagulation diathermy.

The greatest field of gynecologic diathermy lies in the treatment of pelvic infections. The goneococcus is the most generally accepted origin of pelvic infections as is manifested so frequently by a urethritis, Skenitis, Bartholinitis, cervicitis and salpingitis with the complicating pathology of collections of pus in the fallopian tubes and Culdesac of Douglas.

It has previously been an accepted fact that the gonococcus was killed at a temperature of 42 degrees C., (107.6 F.). Quite recently Pelouze has demonstrated that this bacterium in some strains is not rendered innocuous until exposed to 47 degrees C., (116. F.). These findings have been verified in the bacteriological laboratory of the New York Post-Graduate Hospital. On account of this more recent information my former ideas concerning the maximum application of heat in these infections have undergone a change. There is no doubt that this fact explains some of our failures to render the urethra and cervix free of the gonococcus, as I feel that the greatest bene-

fit in this type of infection is derived from the bactericidal action of the diathermic heat units administered.

To apply sufficient heat units to the pathology presented, various types of electrodes have been devised. For the urethra and cervix, the Corbus thermophore is most excellent, the heat units administered being more or less accurately determined by a thermometer inserted in its canal. The thermometer readings give a rough estimate of the temperature generated in the tissues themselves.

It is assumed that everyone here knows that to administer diathermy, a high frequency machine is utilized, that a bipolar current is the one of choice, and to apply it, the placement of two electrodes upon the body is necessary with the anatomical part to be treated between them. The electrodes placed upon the surface of the body are termed the inactive electrodes, and the internal one inserted into a cavity is termed the active electrode. These terms are used both for medical and coagulation diathermy.

Multiple inactive electrodes are advantageous as they reduce any feeling of heat to the patient and less amperage is necessary to maintain the required temperature. One may use the link electrodes or blocked tin on the sacral and abdominal regions. These various inactive conductors are connected to one pole of the machine by means of a multiple connector.

The degrees of heat generated in the tissues varies from normal, (37 degrees C.) to actual destruction or coagulation (60 degrees C.) depending upon the amount of current utilized. The maximum area of heat generated depends upon the size of the electrodes, the amount of current used and the resistance of the tissues encountered thru which the current passes.

To accurately place a given number of heat units in various places in the pelvis, by considering the above factors, has been a weak

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 4, 1930.

spot in medical diathermy. Several years ago I attempted by the use of thermometers passing thru an electrode with the mercury bulb exposed thru a window in contact with the vaginal tissues, to estimate from its readings, the temperature of the adnexa.

By the use of thermocouples it is now being ascertained thru experiments, at what degrees of heat different anatomical tissues react. The variation of these readings has been observed using different sized electrodes with different amounts of current. The urethra, cervical canal, uterine cavity, bladder, ureter and rectum have been tested for temperature with this instrument.

In other words, it has been my endeavor to be able to say that with two electrodes, whose contact surface contains a definite area and with a known amount of current, certain actual heat units as expressed in degrees, can

be applied.

Thru the kindness of the Adlanco Industrial Products Corporation, who contributed a set af thermocouples for research in this field, it has been made possible to test the heat reaction of various pelvic tissues subjected to known electrical forces. The work has been done on animals and the living human, and this is only a preliminary report of the research. Further investigations are being carried on, concerning the morphological and chemical changes in the tissues when subjected to different degrees of temperature.

It seems to be the general impression that possible harmful effects occur when applying heat units to pyosalpinges and tubo-ovarian abscesses; I hope this fallacy has been sufficiently disproved in the last few years. own results in these types of cases, both in hospital and in private work, have been most satisfactory. In only two instances has a bad effect resulted from the use of diathermy. In one instance a pelvic abscess ensued. another case an ovarian cyst was mistaken for a tubo-ovarian infection, which resulted in abscess formation. The first case necessitated a posterior colpotomy and in the latter a laporatomy was done with extirpation of the infected neoplasm. I wish to stress the importance of accurate diagnosis before diathermy treatments are begun and for this reason gynecologists should apply diathermy in pelvic disorders.

With the exception of the two cases mentioned above, only two other cases have not responded to diathermic applications in the last three years. One was a private case and one was a hospital case. Good results were obtained in all others. A most striking result to prove the conservatism of treatment of adnexal infection was in a patient who, seven

years previously had both tubes and one ovary removed for an acute gonorrheal infection. She was referred for operation with an acute re-infection of the remaining ovary. A large mass filled the entire pelvis and the patient was running a septic temperature. After a period of diathermic applications for about five months the remaining ovary resoluted completely. Following several months' further observation she was in perfect health and was able to carry out her marital relations with restoration of menstrual and sexual function.

Many of these apparently frank operative cases have by diathermic treatments, not only had their sex organs conserved, but their fallopian tubes have regained their patency and pregnancy has followed.

An important part in hastening adnexal resolution is the treatment of the cervicitis that invariably accompanies this condition. In the chronic case it is the generally accepted treatment, that removal of the infected cervical mucosa and glands should be accomplished. It is my firm opinion that this can best be done by coagulation diathermy.

Following such therapy, a slough separates leaving a granulating surface that in the course of several weeks becomes epithelialized by regeneration of the squamous cells covering the vaginal cervix.

The technic of coagulation until recently has been done in a more or less inaccurate way, as there has been no method whereby the depth of destruction of tissue has been determined. The first cervical electrode to accurately apply coagulation to the cervix was devised by Ende. The principle involved in this instrument is the incorporation of both the bipolar currents in two wires the length of the cervical canal, forming an active and inactive electrode two m.m. apart. The current passes from one electrode to the other and if 2,000 m.a. of current is used for four seconds, three m.m. of contacting tissue will be coagulated.

Recently I have been using a modification of this electrode with similar satisfactory re-Instead of two wire electrodes, there are two plates 2.8 c.m. long and 4 m.m. wide placed upon opposite sides of a non-conducting material. These are connected thru the handle with terminals of the bipolar current and used in a similar manner to the Ende electrode. The depth of the destruction with this electrode using 2,000 m.a. is four m.m. has been determined by microscopical sections of amputated cervices and by the utilization of the thermocoupling at varying depths of cervical tissue. Knowing the depth of destruction obtained, there cannot arise any complicating post-operative factors such as hemorrhage or

stricture, which too great a depth of coagulation might bring about.

In connection with cervicitis, it might be mentioned that the routine taking of biopsics by the cutting current is a valuable procedure. The laboratory not infrequently reports, from these specimens, premalignant changes in the epithelium and occasionally an early carcinoma, which grossly appears to be a simple erosion.

The technic of this simple procedure can very readily be performed before coagulation is done when a machine is utilized that delivers both types of current.

Further pathological conditions of the genital organs due to chronic infections where coagulation diathermy is most useful, are the destruction of infected Skene's glands, urethral follicles and Bartholin's glands. Abscesses of these structures are easily opened by a needle The pus electrode under local anæsthesia. is readily evacuated and the opening remains patent ten days which allows for complete drainage and resolution. This method reduces to a simple office technic, a procedure, that with the scalpel and wide incision requires hospitalization and narcosis. In the chronic infective stage of these structures a similar technic utilized will destroy efficiently the infected sites.

Further use of coagulation diathermy is the destruction of the uterine endometrium that can be termed endometrial coagulation. Its usefulness is chiefly limited to those cases of essential uterine bleeding that resist all glandular and other types of conservative therapy. These patients have been given radium and x-ray therapy with indifferent results and in some instances complete amenorrhea with a premature menapause has resulted. I consider all these patients as candidates for endometrial destruction and relief will be obtained without an artificial menapause being interjected.

To bring about such a result intra-uterine electrodes have been devised that by utilizing 440 square c.m. of an inactive surface electrode and 1750 m.a. of current for 45 seconds, a depth of coagulation of 5 m.m. will result. As a preliminary dilatation of the cervical canal and a diagnostic curettement should be performed. At the time of treatment, four or five applications of the active electrode to the uterine cavity may be necessary, depending upon its size, before all areas of endometrial hyperplasia have been destroyed.

No post-operative reaction is noticeable. At the end of a week, the slough separates and is extruded thru the cervix in whole or in particles. I present this method as a preliminary report for further enlargement on the subject. At the present time there are too few cases to make a statement concerning their final results. So far it seems a satisfactory and simple method of combating a most intractable disorder.

As a final topic in advanced diathermy, the subject of malignancy should be discussed. In the treatment of cervical cancer over twenty years ago, the celebrated French surgeon, Doven, was the first to use coagulation diathermy. It has been definitely proven that cervical cancer when confined solely to the cervix can be destroyed by coagulation. I have personally, one such case alive five years and in good health. However. when extension to the parametrium has occurred, coagulation alone is useless from a curative standpoint and unfortunately the vast majority of cervical cancers are in this class when we are first consulted. At the present time it is generally accepted that radium is the treatment of choice in these cases. A combined method of treatment is here offered which may or may not be advanced and no doubt has previously been used but not to my knowledge

The entire cervical mass is coagulated with a needle electrode to its utmost limits without damaging important structures. The cutting electrode is then utilized to remove the coagulated cancer, leaving a cooked cavity in the vault of the vagina. The coagulation seals the lymph and blood vessels preventing metastases and hemorthage from the operative manipulation.

The periphery of the cancer where there are live and actively growing malignant cells is next attacked by inserting twelve to fifteen radon seeds coated with gold or platinum. An intrauterine stem containing three centers of radiation is next inserted and a rubber ring pessary is placed in the vagina with two centers radiating the broad ligaments. Another stem of one center of activity is placed against the cancer cavity. This series remains for six days, that administers approximately 12,000 m.c. hours.

Gauze packing is inserted into the vagina to keep the series in situ and to displace the bladder and the rectum as far as possible from the zone of radiation. Frequent bladder and rectal lavage post operatively, will reduce the reaction of these organs. My results following this line of therapy have been more satisfactory than by any other method.

In conclusion I wish to enter a plea that medical and coagulation diathermy be used more often as a conservative measure in pelvic infection, so that radical operative procedures will not be necessary. To further suggest the experimental testing by thermocouples of different high-frequency machines to produce a standardization, whereby a definite amount of heat units can be utilized at the anatomical site desired.

N. Y. State J. M. November 15, 1936

entire body is produced. King and Cocke<sup>5</sup> in recent experiments with high frequency currents for producing therapeutic fever were able to raise the body temperature to six degrees above normal in from one to two hours, maintaining a milliampere reading around 3500, and keeping the body covered to prevent loss of heat. Similar experiments were reported by DeKraft<sup>6</sup> in 1913.

The general characteristics of the various forms of medical diathermy are presented on the accompanying chart. It seemed inadvisable to include in the scope of this paper a detailed exposition of any other form except that of local

diathermy.

states: "There are good reasons for believing that the vibrations set up by the high frequency oscillations may have an important therapeutic effect apart from the heating action." In our present state of knowledge, however, the most satisfactory explanation of the physiological and clinical effects of diathermy is that of raising the temperature of the parts.

The well defined secondary, physiological effects of diathermy are best summarized by Kowarschik<sup>9</sup> as follows: (1) Effects on the circulation. An active arterial hyperemia occurs which appears to be more penetrating and longer lasting than the hyperemia following external

### MEDICAL DIATHERMY

-	1		77	77
FORM	ļ	TECHNIC	EFFECT	REMARKS
Local diathermy	ВІ	Part placed between two electrodes—preferably of equal size and equi- distant.	Through and through heating within physiological toleration.	Heating occurs from with- out inward; it is maxi- mum where current densi- ty is greatest.
General diathermy	TERM	Sets of electrodes placed over large surface of body produce even current distribution.	General heating of body; some local heat under electrodes.	
Auto condensation	INAL	One or more electrodes applied directly to skin; another large electrode under back with a dielectric (insulating material) interposed.	General heating; lower- ing of blood pressure.	Effects are due to con- denser action; alternate charging and discharging of body.
Monoterminal (Oud current	in)	Applied from single high voltage (Oudin) termi- nal through condenser or vacuum electrode.	Local counter irritation and some surface heat- ing.	Current completes circuit by oozing from area of application through floor back to machine.

THE SECONDARY, PHYSIOLOGICAL EFFECTS

D'Arsonval,7 the first investigator of the physiological effects of high frequency currents,

reported his observations as follows:

(1) The tissues traversed by high frequency currents became less excitable to ordinary excitants; (2) a manometer placed in the carotid of a dog showed a fall of many centimeters; (3) after the current had been administered for some time the skin became vascularized and covered with sweat; (4) an increase of respiratory changes occurred, and (5) the thermometer did not show any elevation of the ordinary temperature, the extra heat produced being lost by radiation and evaporation. D'Arsonval's original high frequency apparatus obtained intermittent oscillations with a minimal heat effect but is superseded by the modern diathermy machine producing sustained oscillations and, predominantly, heat effects. That the original claims of D'Arsonval as to specific high frequency effects apart from those of heat had some foundation is shown in the sedative effect of diathermy in cases of neuritis and neuralgia when other methods of heat application failed. Turrell8

sources of heat application. There is also an increased flow of lymph and as a result of both hyperemia and hyperlymphia there is an increase in the volume of the part thus affected. When general diathermy is applied a dilatation of the peripheral vessels occurs and there is a subsequent fall in blood pressure.

(2) Effects on the nervous system: There is a marked sedative and analgesic effect on irritative conditions of sensory nerves. We have no generally accepted explanation for this pain relieving action. It may be that heat in some way lessens nerve sensibility, perhaps as a result of inhibition through the temperature nerves of the skin. Tactile sensibility of the skin increases at 98° F.; decreases at 113° and disappears entirely at 130°. On the other hand, the current from D'Arsonval's original apparatus caused marked analgesic effect without the production of appreciable heat, thus leaving open the possibility of a specific high frequency effect. The sedative effect also extends to hypertonic conditions of motor nerves. Heat has always been effective in relieving muscle cramps and this explains the marked effects of diathermic heat on hypertonic conditions of the unstriped muscles of the stomach and intestines. In seeming conrast to this action, heat also causes an increase of peristalsis in normal or hypotonic muscles; consequently, there appears to be a sedative effect in hypertonus and a stimulating effect in hypotonus.

(3) Effects on metabolism. D'Arsonval's original findings as to the increase of general metabolism have been amply corroborated and there also exist competent observations as to the increase of local metabolism, the increase of secretion of inner organs, and the increase of resorption.

(4) Effects on bacteria. Heat sensitive organisms can be attenuated or killed by heat and thus we can appreciate the findings of D'Arsonval as to the attenuation of diphtheria and pyocyaneus bacilli. Laqueur10 injected bacterial cultures into joints, muscles or subcutaneous tissue of animals and followed this by diathermy to the parts; subsequent cultures proved sterile or showed attenuation of the germs. This effect was most marked in heat sensitive organisms like the gonococcus and pneumococcus and much less marked in case of the heat resistant streptococci and staphylococci. Patients suffering from gonorrhea often obtain temporary freedom from discharge during acute fevers and, as at a temperature of 102° to 105° the gonococcus is injured or destroved, development of heat by diathermy has proved effective in treating gonorrheal infections. Deep hyperemia of the tissues adds to the power of resistance by increased leukocytosis and lymph flow.

While the effects of diathermy are thus explained principally by penetrating heat, attention has been called recently by a number of investigators (Kiritschinsky, 1st Russetzki, 1st Sonntag 1st) to the fact that thermal measures may exert reflex action in internal organs by stimulation of the vegetative nervous system through the nerve endings in the skin (Head's zones).

#### CLINICAL USES

The physiological effects here enumerated form an adequate basis for clinical application of diathermy for numerous disease processes in which heat has proved or promises to be beneficial. Diathermy is often indicated alone; often again it will work to best advantage if properly combined with other physical measures, notably with those producing mechanical effects. Out of the maze of reports to be found in the modern literature, conservative investigators are gradually standardizing the indications for its employment. It would seem that in many conditions for which it had been advocated by some physicians, simpler heat measures would work as well or other physical measures would be more advisable.

There is a fairly well established consensus of opinion as to the effectiveness of diathermy in the following conditions:

Joints, bursæ and bones: Deep hyperemia causes an increased arterial flow with more oxygen and improved nutrition while the greater venous flow carries away in larger degree the products of local metabolism. These effects promote disintegration of inflammatory exudates and assist in their resorption, as shown clinically by the decrease of swelling, relief of pain and restoration of function. For these reasons diathermy has proved invaluable in treating subacute and chronic inflammations of joints and bursi following infections or trauma. Mechanical measures, such as massage and the static wave current, if immediately following, will add to the good effect. No amount of physical therapy will, however, remove hypertrophic bony changes, neither will it make diligent removal of etiological factors unnecessary. Few cases of calcified subdeltoid bursitis are being submitted to operation since thoughtful surgeons have noted the favorable result of properly applied diathermy. The caution should, however, be added that acute forms of arthritis are usually aggravated by diathermy, and the same applies to most cases of acute bursitis.

In delayed union of bone, when there is a fair degree of fixation, diathermy helps to promote healing. So-called stimulative diathermy for non-union, on the other hand, has proved cumbersome and useless. In painful and exuberant callus formation, in fibrous ankylosis following joint injuries, diathermy combined with proper mechanical measures forms an approved routine method of modern treatment. In chronic osteomyelitis, combination with ultraviolet radiations seems to work best.

Chest conditions. Competent observers the world over agree that in the pneumonias diathermy offers a powerful adjunct to other standard forms of therapy. Among its symptomatic effects are prompt relief of pain, transitory relief of dyspnea, improved heart action, general soothing of the patient and induction of sleep, this improvement often helping to tide over critical periods in the course of the disease. In addition, it has been observed that in a large series of cases treated by diathermy resolution occurred more often by lysis than by crisis. There is no evidence, however, that diathermy has materially shortened the course of a typical pneumonia. In delayed resolution diathermy has often effected a favorable turning of the tide. Diathermy consequently is now employed in a number of hospitals as a routine measure in pneumonia, especially so since the technic of its application is simple and does not require any disturbing handling of the patient.

In acute, subacute and chronic forms of bronchitis, as well as in pleurisy, the deep hyperemia induced by diathermy helps to relieve pain, loosens cough and speeds recovery. In essential forms of bronchial asthma the relaxation of the muscular spasm following its application readily accounts for the favorable results already reported.

In chronic inflammation Abdominal organs. of the gall bladder and ducts when surgery is not indicated deep hyperemia produces relief of symptoms and often brings on clinical recovery, as may follow likewise in peritoneal adhesions following gastric or intestinal conditions. In socalled postoperative adhesions results by diathermy alone are not uniform, but when it is combined with exercising currents (sinusoidal or surging faradic) the frequently concomitant atony is more easily overcome and a fairly large percentage of cases show definite improvement. It was shown recently by Stewart and Boldyreff<sup>14</sup> that diathermy could increase the secretion of gastric juice and raise the temperature of the stomach from 1.0° to 1.5° and that of the pancreas by 1 to 6 degrees. Spastic conditions of the stomach, gall bladder, intestines and pelvis of the kidney as well as gastric neuroses are among the affections in which the specific antispasmodic effects of diathermy have proved of value in the hands of many clinicians.

Pelvic organs. Subacute and chronic inflammations such as metritis, parametritis, diseased adnexa, respond well because of the efficient localization of deep heating, especially when applied by the aid of proper orificial electrodes. If the exciting organism is the heat sensitive gonococcus the relief offered is almost specific, as reported by Cumberbatch, Corbus and O'Conor.15 Cumberbatch has shown that diathermy applied to the primary focus of gonorrheal infections, usually the cervix uteri and urethra in woman, the prostate or seminal vesicles in men, resulted not only in local improvement but also in marked relief in the remote seats of infections. Favorable results have been produced, also, in congestive or inflammatory types of dysmenorrhea, although added mechanical measures—such as the static wave current—are often indicated.

Male organs. For the same reason as in gonorrheal infections in the female, prostatitis, epididymitis and seminal vesiculitis in the subacute and chronic stages have been successfully treated by diathermy. Acute gonorrhea in the male has not responded so well.

Neuritis and neuralgia. Diathermy is of material value in the treatment of neuritis like sciatica or brachial neuritis and also in certain varieties of neuralgia or myalgia. Acute cases may become aggravated at first or show no response at all; the best results can be awaited in subacute and chronic conditions in which all possible focal sources of irritation will have been eliminated. Longitudinal diathermy along the affected area followed by the monoterminal

(Oudin) current, usually including the spinal origin, seems to work best results. One must carefully gauge the reaction to the treatment and continue it frequently enough to bridge over painful remissions. The gradual relief thus given allows one to dispense with sedatives and narcotics, although at first mild medication and other supportive measures, especially rest, are essential.

High blood pressure. In its early days the high frequency current was hailed as a panacea for high blood pressure. Clinical experience since then has shown that its use is justified only in primary or essential forms in which there is no demonstrable pathological change. In these cases autocondensation or general diathermy causes dilatation of the peripheral blood vessels and an increase of body temperature, with a resultant drop in blood pressure. Whether there is any other reflex stimulation that might in turn affect the circulation of the splanchnic area and other areas is as yet undetermined. The drop after each treatment often amounts to five or ten millimetres of systolic pressure while the cumulative effect of a series of such treatments may bring the blood pressure to nearly normal and keep it so for a varying period of time. Concurrently the symptoms caused by the high pressure often show definite improvement or cessation. Unfortunately, the results are not consistent and hence the diversity of opinion as to the ultimate value of this mode of treatment.

Miscellaneous conditions. The enumeration here given comprises by no means all disease conditions in which diathermy has been advocated; one may mention in addition angina pectoris, endarteritis obliterans, intermittent claudication, Raynaud's disease among circulatory disorders; early stages of poliomyelitis, sclerosis multiplex, paralysis agitans and recently even dementia paralytica among organic nervous disorders and many other conditions of the various special organs. Unquestionable good results have been reported in some of these cases but matured judgment, based on a large number of observations and on sufficient amount of control cases, are essential to establish the value of diathermy in any condition with a seemingly hopeless pathology. Some of the improvements described in print undoubtedly followed temporary functional stimulation. treatment of paresis by general diathermy, reported recently by King and Cocke<sup>5</sup> is based on the theory that the rise in temperature in self limiting pathological conditions may be the cause of the process of cure and the production of artificial fever by diathermy can be more accurately and safely controlled than by the method of malaria or typhoid germ or foreign protein injections hitherto advocated.

### CONTRAINDICATIONS

As with any new method of somewhat spectacular nature, there is at present a tendency to use

diathermy for many conditions to the exclusion of more directly indicated or simpler physical or other therapeutic measures; or, at times, when it is absolutely contraindicated.

Diathermy is relatively contraindicated in disease processes in which the simpler and safer methods of superficial heat give satisfactory results. Ordinary contusions, simple myositis, will readily respond to luminous heat, the same form of heat causing acceptable results in bronchitis of children and in non-purnlent forms of sinusitis or otitis media. So, too, complicated methods recommended by some for applying diathermy to fingers, toes, and sinus tracts seems superfluous in view of the fact that heat effects can be produced much more safely for these areas by luminous or infra-red rays. Superficial neuralgias and neuritis can be frequently relieved by these rays followed by a mild application of the Oudin current.

Then, again, if a condition should require penetrating heat effects it is not necessary that these should be as intense as that by diathermy. As Turrell<sup>8</sup> aptly expresses it, "it does not necessarily follow because a method of raising the heat of a part to its normal or even slightly above its normal temperature is beneficial, that, therefore, it is advisable to raise the temperature to fever heat." It is an experience reported from several sources that in the atrophic forms of chronic arthritis, as well as in arthritis deformans, not only had relief failed but that often an aggravation of symptoms followed diathermy instead of which prolonged galvanism proved beneficial. It seems as though these atrophic joints do not take kindly to an onrush of heat but will respond to mild stimulation by galvanism. Kowarschiko of Vienna likewise points out that in the treatment of neuritis and neuralgias the time proved sedative effects of galvanism are often found superior to those of diathermy.

Diathermy should not be used as a panacea for all sorts of undiagnosed painful conditions. A complete diagnosis, a definite conception of the underlying pathology to be influenced and consideration of the individual equation in each patient are essentials for its successful use.

Diathermy is absolutely contraindicated in only two conditions: (1) Acute inflammatory processes accompanied by fever and suppuration. Acutely inflamed joints in infectious arthritis are made worse by it and it serves almost as a diagnostic evidence that the process has entered the subacute stage when diathermy can be well tolerated. In joints with old osteomyelitic infections, "provocative" diathermy may indicate by the absence or presence of irritative symptoms (fever, pain) following the application as to whether there is any lurking infection. Gynecologists have used provocative diathermy to determine whether it is safe to operate in chronic pelvic

infections as aggravation of local symptoms and a slight rise in temperature are caused by diathermy in cases in which operation is not safe. In acute, non-draining suppuration, such as otitis media, appendicular abscess, acute pelvic infections, unwisely applied diathermy may lead to real danger by spreading the process.

(2) Tendency to hemorrhage as in recent hemoptysis from gastric ulcer, in pregnancy, etc., is another prohibitive indication. For the same reason it is advisable not to apply diathermy to pelvic organs during the menstrual period.

#### ESSENTIALS OF TECHNIC

Correct application of diathermy in the various conditions here enumerated can only be acquired through ample clinical instruction. It is not fair to reputable manufacturers to expect their salesmen to be instructors in technic, for the safe and efficient use of diathermy does not consist simply in applying two electrodes and then snapping on a few switches. Poor results and at times suits for malpractice on account of burns have been the outcome of attempted short cuts from manufacturer to physician, leaving out the intermediary of required instruction in the clinic.

Electrodes. The function of electrodes is to serve as an entry and exit of the current; they should therefore conform in size and shape to the surfaces to be treated and their position should be such that this area to be subjected to heat penetration offers the direct and shortest path for the current.

There are two principal ways in which to arrange the relative position of electrodes:

(1) The transverse or "through and through" method consists of applying two electrodes on opposite surfaces of the body. This insures a fairly even heating of all tissues in the path of the current and is therefore the method of choice for heating joint and ligamentous bony structures as well as for the heating of internal organs.

(2) The longitudinal (cuff or semi-cuff ` method) consists of two suitably bent plate electrodes placed all or partly around an extremity or around some part of the trunk. Travelling from electrode to electrode along the less resistant soft parts, this method will principally heat up the skin, the muscles, the periarticular structures and nerves if not too deeply situated Applying full cuffs around an extremity is acceptable only if the limb can be fully extended so that the current will travel all way around and not concentrate on one surface only; also, if the cuffs are kept a considerable distance apart (twelve to fifteen inches at least) so that the current should not have the tendency to pass along the skin only.

Electrodes must be applied accurately to the surface and held in good contact throughout the treatment, while at the same time avoiding too much pressure over irregular and bony surfaces.

The best and most generally used material for electrodes is a soft sheet composition (tin and zinc) known as Crookes' metal of about twentytwo gauge thickness, for it is cheap, may be cut any size and bent to conform to any surface. Like most other physicians, I never use soap or other interposed material between the skin and the plates; preliminary exposure of both skin and electrodes to luminous heat for a few minutes will warm up and moisten them, thus taking off Sharp edges and wrinkles must be smoothed out before application. The advantage of some of the readymade rigid electrodes is that they are easily applicable by quick mechanical fixation, their surface being smooth, and they can be kept fairly clean, thus saving time and effort in a busy clinic. Undue pressure should, however, be avoided when applying them, a caution at times needed.

Before turning on the current from the main outlet, inform the patient that all sensation that she or he may expect is that of mild heat but ask that any uncomfortable feeling, pricking or burning be at once reported. In advancing the current strength it is advisable to go up on the main control rather than opening the spark gap too widely. Opening the spark gap too far is the most frequent cause of the so-called faradic sensation. Do not push the current up to maximum heat toleration during the first few treatments. Do not encourage the patient to show off how much current can be borne. Never go beyond the dosage calculated according to the size of the active electrode but stay well below it any time the patient complains of excess heat or pain, Be sure, after complete tests, that the tactile and heat sensations of the patient are normal. Special precautions are needed in cases of recent scar tissue, peripheral nerve injuries, hysterical anesthesias, and it is advisable that one should adhere to the rule of staying well below the calculated As stated previously, best results in diathermy are not at all dependent upon using the maximum amount of current the patient can

Duration of treatment. It is evident that it takes a certain amount of time for the temperaure of the part treated to reach the desired height and then, through automatic heat regulation (the blood stream and conduction by the surrounding tissues), a condition of equilibrium will ensue so that a steady temperature is maintained. It is also evident that superficial parts can be heated up much faster than deeply seated structures, shorter treatments being indicated, as a rule, for the former than for deeper conditions. Clinical experience shows twenty minutes to be the average duration for an efficient diathermy treatment while in chronic, deeply placed conditions or the treatment of internal organs about one-half hour or even longer may be required. Excessively long

treatments may cause too intensive a heat effect and thereby exhaust the patient, especially if aged.

After termination of treatment the site of electrodes should be always carefully inspected and any changes noted. In time of inclement weather patients who have warmed up considerably during a treatment should not depart immediately but should rest for ten to fifteen minutes, preferably recumbent, in order to cool off.

Frequency of treatment. Acute and very painful conditions or recent injuries in which the early return of function is essential as a rule require daily treatments. With improvement of such conditions this repetition can be reduced. For the average patient suffering from some chronic ailment treatment on alternate days usually suffices and may be administered even less often, dependent on the underlying diagnosis and the progress noted.

### Conclusions

Medical diathermy produces through and through heating of tissues. Its physiological ef fects are: active hyperemia, relief of pain spasms, increase of local and general metabolattenuation of virulence or killing of bacteria. clinical uses are chiefly in subacute and chron inflammatory conditions. Diathermy will work best advantage in the hands of a physician who received adequate theoretical and practical training along the entire field of physical therapeutics and who will use diathermy on the basis of definite indications and if necessary in proper combination with other indicated measures. Diathermy is not a cure-all for obscure painful conditions and should not be used where simpler methods of superficial heat applications are sufficient.

### THE RETURN OF THE GENERAL PRACTITIONER

By HYZER W. JONES, M.D., UTICA, N. Y.

Abstract of the President's address at the Annual Meeting of the Oneida County Medical Society, January 14, 1930, at Utica, N. Y.

TUCH has been written and said about the passing of the country doctor. view this as a phase in the adjustment of medical practice: Others see it as a calamity. Empiric practice more and more gives way to scientific investigation, with the result that we are much nearer the time when medicine can be an exact science. Much has been gained, but something has been lost.

The old preceptor was a psychologist as well as a physician. No patient came to him just a case. He was a past-master in the art of personal

medicine.

As science grew, teaching drifted from the bedside to the microscope and laboratory, and bedside instruction to a certain extent lost its place. Many of our teachers today have never been in active practice. They know their science but the art of practice is to them a doubtful or unknown quantity.

With the passing of Christian Science, the osteopath and the chiropractor, it now looks as though medicine might again come into its own. Through efforts of a tactful committee of our own society, we are about to launch a campaign in the interest of periodic health examinations. The intelligent laity knows that it is important to check up occasionally to determine our own state of health. A generous reception has been accorded our committee. To the question, who makes these examinations, the answer is, of course, your own family physician. Some will say: I have no such, and he then needs to form an alliance with a competent medical attendant who will keep him in health or be within call when he or a member of his family is ill. Some physicians wonder if they are equipped to make the examination or if the public will be satisfied with the kind they make. For a great many years the leading life insurance companies have furnished blanks to cover the subject well. The

actuaries know what information is necessary. These examinations carefully made keep the physician alert and he knows he will be paid. He can do as much certainly for a man who wants not a casual "how do you feel today?" but a real systematic search for abnormalities.

I do not consider seriously the suggestion that our health examination program will develop another specialist, the health examiner. It will bring back to the family physician a type of work which he is better fitted than any one else to do. He knows the patient's strength, his resistance and his recuperative power, and the public can

not find a satisfactory substitute.

It will take years of propaganda to interest every one, but we are fortunate in having a group like the Council of Social Agencies of Utica and Oneida County to arouse public interest. The man with physical impairment takes much better care of himself than the man who regards himself a 100 per cent fit. It is not too much to expect that these examinations will postpone for a few years a break in the family circle, and prolong the useful life of a man whom the com-

munity can ill afford to spare.

Years ago the Society for the Prevention of Tuberculosis started its conquest of the great white plague by urging early recognition of the disease by the family doctor. More recently the American Society for the Prevention of Cancer published a pamphlet on "The Key Man in the Control of the Cancer Problem," which unerringly points to the family doctor. Those who have no such contact villify the profession, and say that such can not be found. It is the fault of the public, not of the doctor. It may be difficult for the layman surveying the galaxy of stars in the medical firmament to decide which he must follow; but the one whose beam shines through all weather with never failing light is the star of the general practitioner.

### TREATMENT OF SKIN CANCER\*

By JOSEPH JORDAN ELLER, M.D., and EVERETT C. FOX, M.D., NEW YORK, N. Y.

From the Department of Dermatology, New York Post-Graduate Medical School and Hospital.

Correlation of Physical Agents With the Various Surgical Procedures

HE early recognition by the general practitioner and the judicious treatment of those dermatoses which may lead to cancer would aid in lowering the mortality rate in this disease. In a recent paper we have shown that there are over twenty different skin conditions which are prone to cancerous growths. All workers in the field of malignancy agree that a greater number of cures in this disease depends on the early diagnosis, followed by adequate therapy. Considering this fact it should also be important to recognize the skin conditions which are forerunners of cancer and to eradicate them.

The following skin conditions have been found to be forerunners of cancer and are hereby given in their approximate order of importance:

Syphilis. Leukoplakia.

Radio-dermatitis.

Moles (also malignant lentigo, melanotic whitlow).

Senile keratoses.

Seborrheic keratoses.

Kraurosis vulvæ.

Occupational keratoderma (tar, pitch, arsenic, dust, oil, heat, etc.).

Lupus vulgaris and tuberculosis cutis.

Arsenical keratoses.

Seborrheic keratoses.

Lupus erythematosus.

Chronic ulcers (varicose ulcers, pellagrous ulcers, fistulæ, etc.).

Paget's disease of the nipple.

Cicatrices.

Cutaneous horns.

Bowen's disease.

Extramammary Paget's disease.

Papilloma of tongue.

Xeroderma pigmentosum.

Blastomycosis.

Inflammatory dermatoses (psoriasis, lichen planus, eczema).

Before outlining the therapeutic procedure in the treatment of cutaneous new growths, an effort should be made by microscopic study to determine the probable degree of malignancy and the approximate radiosensitivity or radioresistance. With the exception of melanomas, a careful removal of a small section for microscopic study seldom results in any harm.

Roentgen rays and radium are important agents in the treatment of malignant neoplasms of the skin. They may be used singly or in combination. Either one may be combined with the various surgical procedures; such as curettage, excision with the scalpel, the high frequency knife or with destruction by electrocoagulation. The method of therapy differs for the various types of malignancy and in the same type of tumor according to the location. The best results are obtained by those who follow no routine or who do not become faddists of some one physical agent. One should individualize in each case and be prepared to use the various forms of irradiation with or without the different types of surgical treatments as may be indicated.

The malignant cutaneous new growths which will be included here are as follows:

- 1. Basal Cell Epithelioma.
- 2. Prickle Cell Epithelioma.
- 3. Basal Squamous Cell Epithelioma.
- 4. Transitional Cell Epidermoid Carcinoma.
- 5. Melanocarcinoma.
- 6. Paget's Disease of the Nipple.
- 7. Bowen's Disease (Intra-epidermal Carcinoma).
- 8. Sarcoma.
  - (a) Fibrosarcoma.
  - (b) Spindle Cell Sarcoma.
  - (c) Giant Cell Sarcoma.
  - (d) Neurogenic Sarcoma.
  - (e) Dermatofibrosarcoma.
  - (f) Melanosarcoma.
  - (g) Lymphosarcoma.

### Basal Cell Epithelioma

A large number of chronic lesions of the skin in individuals past forty are found to be basal cell epitheliomas. They frequently develop on seborrheic keratoses. Basal cell epitheliomas may differ greatly in their clinical appearance. They may occur at any site over the body. may be superficial or deep, nodular or ulcerating. It is interesting to note, however, that about eighty per cent of these lesions occur about the head and neck. The method of treatment to be chosen depends upon the character of the lesion and its location. The large majority of basal cell epitheliomas can be cured especially when treated early. However, lesions which have been present for a long time and which have invaded bone and cartilage may prove much more resistant to radiation and require more intensive treatment.

MacKee<sup>2</sup> reported a large number of basal cell epitheliomas treated entirely by roentgen rays. His results were equal to those obtained by other methods of treatment. In over 400 cases he had 87 per cent permanent cures in unselected

<sup>\*</sup>Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 3, 1930.

cases and 91 per cent permanent cures in selected cases. Hazen³ reported his results of 200 cases treated entirely with roentgen rays, with permanent cures of 86 per cent in unselected cases and 93 per cent in selected cases after observation of one to eight years. Most of the failures reported in both MacKee's and Hazen's series were in lesions of long duration with involvment of bone or cartilage.

Equally good results have been obtained by radium especially in the last few years. Quick's reported 800 cases of basal cell epitheliomas of the face, 95 per cent of which have had complete regression. Quigley's treated 140 cases of the face with 15 failures. Morrow and Taussig's treated 322 cases with 113 cures under one year, 186 over one year, 13 still under treatment and

Our results with irradiation have been similar to the above and the results with roentgen rays or radium were practically of equal value. However, radium was successful in a few cases where roentgen rays had failed. At times radium can be more easily utilized than roentgen rays, especially in such areas as the inner canthus of eye and the alæ of the nose. On the other hand roentgen rays are more widely available and dis-

tinctly less expensive.

We have used the unfiltered roentgen rays for the majority of our basal cell epitheliomas. The following were our standard factors: three milliamperes, one hundred kilovolts (6 in. sp.g.), eight inch distance from target to skin, time five or six minutes, i.e., 21/2 or 3 skin units. This exposure may be repeated two weeks after all reaction has subsided (6-8 weeks); or a dose of lesser intensity given according to the progress or size of the lesion. Usually two such treatments were sufficient for a cure. The larger lesions were routinely destroyed by electrocoagulation before roentgen ray therapy. Our experience has been that preliminary destruction by electrothermic methods increased the number of cures and decreased the amount of radiation necessary. One-eighth to one-quarter of an inch of normal skin about the lesion was included. We believe that this is an important factor in preventing recurrences.

Lesions involving the cartilage of the ear or nose are completely destroyed by electrocoagulation or excised with the high frequency knife; followed by two skin units of unfiltered roentgen rays or the equivalent dosage of radium element or radon applied to the site of the lesion. In this manner severe radium or roentgen ray reaction is avoided in the cartilage, and healing is much more rapid. Skin lesions involving the bone require removal of the diseased bony tissue.

Lesions of the cyclids not involving the conjunctiva in selected cases may be treated successfully with roentgen rays or radium. If the eyeball is in the line of the rays the eye must be

protected with a brass eye shield inserted beneath the lids. Supersoft roentgen rays (Grenz Rays 2 AU) have been used by us with success in epitheliomas of upper eyelid but they have failed in lesions of the lower eyelids.

Radium element or radon used in the form of plaques or packs for surface applications accomplish the same results as roentgen rays in the treatment of basal cell epitheliomas. The average lesion of this type may be cured with radium The following treatment is given: a full strength plaque filtered with two millimeters of aluminum and one layer of rubber dam giving a dosage of 40 to 60 milligram hours per sq. cm. for small lesions and 40 to 50 milligram hours per sq. cm. for the larger lesions (larger than two square cm.). For the more deeply infiltrated lesions a filter of 2 m.m. of brass is used giving a dosage of 60 to 80 mgm. hours per sq. cm. Two to four millimeters of normal skin about the lesion is included. The surrounding skin should be protected with lead plates having windows the size of the area to be treated. The plaque with the filters is then applied directly to the lesion and secured in place by adhesive faced adhesive is of value in maintaining good approximation. Often one such treatment is sufficient for a complete regression of a basal cell epithelioma. When the regression is not complete the treatment may be repeated two weeks after all reaction has subsided. Other methods of applying radium may accomplish equally good results in experienced hands.

#### Prickle Cell Epitheliomas

Prickle cell epitheliomas present a more difficult problem than the basal cell type. grow more rapidly, may metastasize early, and usually are more resistant to radiotherapy. complete destruction of every cancer cell is important and must be accomplished early and rapidly. This type of cancer may occur at any site. They often develop on such lesions as senile, arsenical, and tar keratoses, smokers patches, and other types of leukoplakia. They are frequently seen on the lip, tongue, buccal mucosa and floor of mouth. It has been our observation that the majority of epitheliomas of the extremities are of the prickle cell type, especially those on the dorsum of the hands. Recently one of us7 reported a number of prickle cell epitheliomas developing in senile keratoses with the conclusion that epitheliomas resulting from senile keratoses were always of the prickle cell type.

The treatment of prickle cell epitheliomas varies depending on the location and the character of the lesion. A microscopic study is necessary in each case, for proper therapy cannot be given without knowing the type of lesion, degree of malignancy and its probable radiosensitivity. The information often to be gained by histologic

study warrants the danger of making a biopsy of a neoplasm. Ewing<sup>8</sup> warns against indiscriminate biopsies but says, "the removal of a small carefully selected portion of a readily accessible tumor seldom results in any harm." We believe that the dangers of a biopsy are overestimated.

Our discussion of treatment is limited to localized lesions without apparent glandular involvement. The dermatologist is usually not equipped to treat those cases that present involvement of the glands. The latter are better handled by a surgeon in collaboration with a radiotherapist.

Early prickle cell epitheliomas of the trunk or extremities can be treated successfully by radiation alone. Most often, however, it is desirable to first remove the lesion surgically or to destroy it by electrocoagulation. Following this radium or radon should be applied. When radium is used intensive gamma ray radiation should be employed. Even though there be no apparent involvement of the adjacent glands a series of prophylactic exposures of roentgen rays filtered through three millimeters of aluminum should be given, i.e., erythema doses at intervals of two months for three treatments.

In our treatment of prickle cell epitheliomas with radium, the required doses were given over a period of 4 to 8 days, giving equal time each day during this period after the method of Regaud.<sup>9</sup> Continuous treatment with large doses over a period of several days gave us satisfactory results.

When it was found preferable to implant radon seeds into the tumor, gold seeds were used as they could be left in the tissues permanently, each millicurie thereby giving 133 millicurie hours of treatment.

The lesions over cartilagenous areas, particularly the ears, are very resistant to irradiation. These lesions should first be thoroughly destroyed by electrocoagulation and then followed by irradiation. Much better results have been obtained in these cases since adopting this method of destruction, especially when the cartilage was involved.

Lesions in the inner canthus of the eye which are usually of the infiltrating type respond well to radium treatment when the growth is first destroyed by electrocoagulation.

Lip lesions are much more serious than those of the glaborous skin. They grow more rapidly and may metastasize early. They may be papillary, ulcerating or infiltrating. The infiltrating type is the most dangerous for it metastasizes more quickly. The papillary type responds more rapidly to radiotherapy. Early superficial localized lesions of the lip can readily be cured with surface applications of either radium plaques or tubes. However, we believe it best to destroy these lesions first with electrothermic methods and then to apply full strength radium plaques to the involved area; and to give 80 to 100 mgm. hours

per sq. cm. through a filter of 2 m.m. aluminum. When tubes are used with a filter of 0.5 m.m. of silver 80 to 100 mc. or mg. hrs. are given to each sq. cm. The area to be treated should always include about 5 m.m. of tissue beyond the lesion. The tissue outside the area to be treated should be protected by proper screening. Prophylactic exposures of roentgen rays should always be given to the lymphatics which drain the lip area even though there be no evidence of involvement.

Lip lesions which are more deeply infiltrated require more intensive therapy. In addition to the above surface applications, gold radon seeds may be permanently buried in the lesion using one seed for every cubic centimeter of tissue treated. These seeds may be 1 to 1.5 millicuries each, depending upon the reaction desired. We have never seen any deleterious effects as a result of the permanent implants acting as foreign bodies. This combined surface and interstitial method of applying radium will usually produce

complete regression of the lesion.

Our highest percentage of good results have been obtained by first excising the lip epithelioma widely with the high frequency knife, following which the site of the lesion was treated by an erythema dose of gamma rays of radium by surface applications or by the implantation of gold seeds as described above. In a few early cases excision alone with the high frequency knife was sufficient to cure. We believe that the patient should have the additional safety factor to be derived from radiotherapy in all of these cases. When surface applications only are employed. the dose can be considerably increased by cross firing through three portals of entry, i.e., applying an applicator over lesion, on the mucosa, and on the skin externally. As was mentioned before prophylactic doses of roentgen rays were always given to the lymphatics draining the involved

Regaud<sup>9</sup> utilizes wax molds for surface applications. Platinum tubes of 0.5 m.m. wall thickness and containing 5 to 10 mgs. of radium are approximated to the external surface of the mold at one centimeter distance. The radiation is given over a period of 5 to 8 days. His results in lip cases have been good. He reported cures of 98 per cent of operable cases without glands, and 92 per cent of operable cases with glands. In cases of doubtful operability including those with glands he had 72 per cent cures.

Quick<sup>10</sup> uses heavily filtered radium or radon at a distance of one cm., or gold filtered radon seeds interstitially. His results equal those of

Regaud.

Lesions of the tongue, floor of the mouth and buccal mucosa differ widely in regard to malignancy and radiosensitivity. Metastases occur increasingly according to the location as follows: anterior tongue; posterior tongue; infralingual and floor of the mouth. Metastases are greater from the tongue and floor of the mouth than from the lip and the glands involved are deeper. For the mouth lesions, the interstitial method of

FIGURE 1 Prickle cell epithelioma of lower lip. Microscopic diagnosis by J. F. Fraser, M.D. Duration six months; no palpable glands.

irradiation with or without electrothermic methods as indicated have given us the most satisfactory results. Tongue lesions may be treated by interstitial irradiation with gold radon seeds implanted permanently into the tumor area and across the base of the tongue (to block the draining lymphatics). Prophylactic roentgen therapy should be given to the draining lymphatics of the cervical

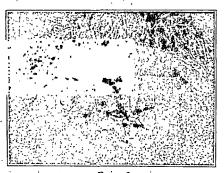

FIGURE 3 Prickle cell epithelioma of lower lip-duration two years -before excision by high-frequency knife.

region. We usually use 1 or 2 mc, seeds and place one seed to each cubic cm, in and around the tumor area and four to six such seeds in the base of the tongue. The reaction may be severe but necrosis as a rule does not occur. uses gold seeds interstitially and the radium pack

(4 gms.) for external irradiation giving as much as 10,000 to 12,000 mc. hrs. to each side of the neck at 6 cm. or 10 cm. distance and in addition high voltage roentgen rays. He believes that the

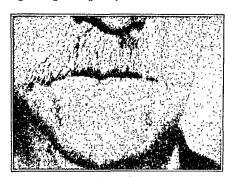

FIGURE 2

tissue will tolerate a larger dose of external irradiation when both radium and roentgen rays are used and that radium has the greatest effect on cellular areas and roentgen rays the greatest effect on fibrous areas. By this combined method of interstitial and external irradiation he gives from

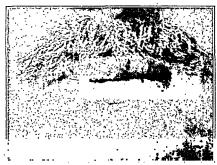

FIGURE 4

Same as Fig. 3-after excision by high-frequency knife followed by high voltage roentgen rays to lymphatics of neck. No recurrence in three and one-half years.

2 to 10 skin erythema doses to the tumor area in 4 to 8 days according to the degree of malignancy and radioresistance of the tumor.

For tongue lesions Regaud's uses platinum needles of varying length with a wall of 0.4 m.m.

thickness. These needles contain radium or radon and are inserted into the tumor area and surrounding tissue. For the base of the tongue and lymphatics external irradiation is given by means of molds and packs of radium at a distance. This treatment extends over a period of 5 to 8 days.

Epithelioma of the penis which is usually of the prickle cell type responds well to roentgen rays and radium in early cases. One to three per cent of all cancer in the male is found on the penis. Two types are seen; the papillary and the flat infiltrating. They usually begin as a small indurated area and soon present a small central If treatment is begun before the deep tissue is invaded an early cure is to be When the growth has spread past Buck's fascia the lesions do not respond as well to radiation and a certain number require amputation of the organ. This is best accomplished by electrothermic methods. For small lesions of recent development we have used full strength plaques of radium with a filter of 2 m.m. aluminum giving 80 to 100 mgs. hrs, per sq. cm. Prophylactic roentgen rays are given to the inguinal glands. Pfahler and Widmann<sup>11</sup> reported ten cases of cancer of the penis treated by radiotherapy and electrocoagulation, with nine cured from five to twelve years. They believe that irradiation of the glands gives superior results to resection. Dean<sup>12</sup> reported 75 cases of epithelioma of the penis. None of his cases occurred in individuals who were circumcised in infancy. believes the tight prepuce to be the most important causative factor. He uses radium for the primary lesions and roentgen rays for the glands in the groin. The primary lesions receive 1,200 mc. hrs. per sq. cm. at one cm. distance with the radium in silver tubes of 0.5 m.m. walls. Dean uses a radium pack (4 gm.) for groin metastases giving 9,000 mc. hrs. at 6 cm. distance with 0.5 m.m. silver and 1 m.m. brass. This is followed in three to four weeks by block desection. reported good results with radium alone in lesions less than two centimeters in size and those larger he found required combined surgical measures and irradiation. In most of his cases radical amputation was not necessary.

Epithelioma of the vulva is not common and usually occurs in those past fifty years of age. When treated early, the prognosis is favorable. When operable these lesions should be removed by wide excision, with the high frequency knife and radon seeds implanted throughout the area. Deep roentgen rays are given to the groins. Rentschler<sup>13</sup> reported 71 cases which were treated by excision of the primary mass and resection of the glands of the groin. Radium and roentgen rays were given to the site of the primary lesion and to the groins. Forty-four died, seventeen are living and thirteen are free of the disease. As a measure of prophylaxis all cases of kraurosis vulvae should be treated by

radical excision. This gives prompt relief from all symptoms and prevents the development of epitheliomas. Roentgen rays and radium fail to influence the course or symptoms of kraurosis vulvae and are contraindicated.

### Basal-Squamous Cell Epithelioma

"Basal squamous cell epithelioma" is a term used to describe the transitional form that occurs between the basal cell and the squamous cell epithelioma. We have been able to study one case that fits into this group. The following conclusions drawn by Montgomery<sup>14</sup> from his studies of fifteen cases which he defined as basal squamous cell epithelioma are as follows:

"In a series of basal cell epitheliomas diagnosed clinically as such, from 15 to 20 per cent on microscopic examination will probably prove to

be transitional in character."

"Basal squamous cell epithelioma, in the majority of cases, is relatively resistant to roentgenray and radium treatments as compared with basal cell epithelioma. Radiotherapy should be used only as a last resort in the treatment in these cases."

"Surgical treatment, with an unusually wide excision because of the insidious infiltration of the tumor cells, is indicated whenever possible."

There is no doubt that all of us have encountered what appeared to be typical basal cell epitheliomas which were most resistant to intensive doses of roentgen rays and radium. Perhaps some of these resistant lesions belonged to the type described by Montgomery, who stated that this transitional form occurs frequently and on account of their tendency to metastasize, their prognosis is serious as compared with basal cell epithelioma.

### Transitional Cell Epidermoid Carcinoma

The predominant clinical features of transitional cell epidermoid carcinoma are: usually a small primary lesion of the base of tongue or tonsil; early metastases with wide dissemination;

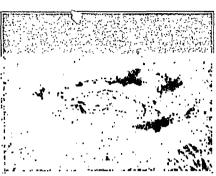

and rapid response to irradiation.

Ewin, <sup>16</sup> Quick, <sup>16</sup> and Cutler <sup>17</sup> who studied a large number of intra-oral epidermoid carcinomas found that a certain percentage responded more rapidly and more completely to irradiation than the others. These tumors were found to possess other characteristics; i.e. usually a small primary lesion, early metastases and pathological characteristics which differed from other epidermoid carcinomas. Quick and Cutler termed these growths "transitional cell epidermoid carcinoma."

The most common site of these lesions are the tonsil, base of tongue and nares. The appearance of the primary lesion is more or less characteristic and differs from that of a primary squamous cell lesion. The transitional cell lesion is flat and presents a finely granular, velvety surface which looks like an erosion of the mucous mem-

brane rather than an ulceration. Squamous carcinoma usually presents an elevated indurated lesion with a depressed ulcerated center and has a coarsely granular appearance. The primary transitional cell lesion is frequently small or indis-

erroneously diagnosed as bronchiogenic cinoma, endothelioma, or lymphosarcoma. transitional cell neoplasm must always be considered before making a diagnosis of primary disease of the cervical lymph nodes.

Prickle cell epithelioma of lower lip before excision by high-frequency knife and high voltage roentgen rays to neck lymphatics.

Lymphosarcoma of chin in man sixty years of age. The lesion was a lemon size stony hard mass of twelve years' duration. There was a nut size hard gland on left side airation. Inter was a nut size hard giand on left side of neck. Ewing, Salenstein and Fraser made a microscopic diagnosis of lymphosorcoma. The lumor and gland were removed by the high-fraquency knife following which the base was electrocagulated. Following this three treatments of high vallage roentgen rays were given the neck lymphatics, and site of the lumor.

Same case as Fig. 7 after therapy. No recurrence after two and one-half years.

cytoplasm growing diffusely. Adult squamous characteristics such as cornification, spines, and pearl formation are absent.

The marked radiosensitivity which lead to the

rapid. Recurrences are frequent. Often metastases although not apparent have occurred before therapy was instituted. One of our cases of lymphosarcoma treated two and one-half years ago has had no recurrence. This patient was a man sixty years of age who had a lemon sized stony hard mass of twelve years duration on his chin. There was a nut sized firm gland on the left side of his neck near the chin. The above microscopic diagnosis was concurred in by Doctors Ewing, Satenstein and Fraser. The lesion and gland were removed by the high frequency knife, following which the base was electrocoagulated. The next day high voltage roentgen rays in erythema doses were given to the neck lymphatics and site of the lesion. This was repeated twice at intervals of two months.

The preferable therapy for lymphosarcomas is by irradiation alone, but due to the unusual hardness of the mass, we felt that combined surgery and radiotherapy was indicated in this case.

The best results in early sarcomas are obtained by a combination of radiotherapy and surgery. The dose required with either roentgen rays or radium is the same as that given for prickle cell epitheliomas. Following the initial radiotherapy, if there is considerable regression indicating radiosensitivity, they may be treated entirely by this method but the more radioresistant lesions will require surgical excision and postoperative radiotherapy.

### Summary

1. The treatment of the various types of cutaneous malignant neoplasms has been outlined. The plan of therapy which in our opinion offers the best prognosis was given.

2. We noted those conditions which had a high degree of sensitivity to irradiation and which could be satisfactorily treated with irradiation

alone.

- 3. Those lesions which should be treated by some surgical method combined with irradiation have been discussed.
- 4. The information often to be gained by histologic study warrants the danger of making a biopsy of a neoplasm. In this way the degree of malignancy and its probable radiosensitivity may be determined. The removal of a small carefully selected portion of an accessible tumor seldom results in any harm.

### PROGNOSIS OF BLOOD STREAM INFECTIONS IN CHILDREN\*

By ROGER H. DENNETT, D.Sc., M.D., and ABBOTT WILLIAM ALLEN, M.D., NEW YORK, N. Y. From the Pediatric Department of the New York Post-Graduate Medical School and Hospital.

HIS is a comparative study in children and in adults of 115 consecutive cases of positive blood stream infections of various types, 71 being over twelve years of age and 44 being under twelve years of age. Long observation has led us to believe that the prognosis is better in childhood with these various blood stream infections, particularly the streptococci, than it is in adult life. We have seen many children with positive streptococcus in--fection in the blood stream who have recovered without any apparent damage, evident

\*Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 3, 1930.

at the time of discharge from the Hospital. It occurred to us that it would be instructive to compile the exact figures and report them. Although the series is small, it is felt that the deduction may be of some value.

Blood cultures were taken from patients with a septic type of temperature, either unexplained or with a definite focus, or where there were petechia or metastatic signs or where the cardio vascular system was involved. Cases of typhoid fever and meningococcus meningitis were excluded as not being pertinent to this study, on the assumption that at some time during the course of these

diseases positive blood cultures may be obtained. The cases were about evenly divided between male and female, with a slight preponderance of males. The difference was so slight, however, that it was considered unnecessary to so classify them.

There were a large number of patients with negative cultures which were not pertinent to the subject at hand. Undoubtedly, more sensitive laboratory methods will eventually reveal positive blood stream infections in a large percentage of cases now found to be negative. Until blood culture technique has been further perfected, we may not assume that because a culture is negative there is no blood stream infection. All of the positive cultures were verified by one or more subsequent bacteriological examinations. It is not the purpose of this paper to attempt any detailed discussion of septicemia. It is our desire to call attention to the differences between children and adults in septicemia, with a comparative study of the

end results. Children are arbitrarily classed as those patients who have not reached their twelfth birthday.

In taking cultures the following technique was used: the blood for the culture was taken from some superficial vein, usually the median basilic, after iodine alcohol skin preparation. Approximately 15 cubic centimeters of blood were taken in a Taylor¹ tube containing about 5 cubic centimeters of sterile 10 per cent sodium citrate in 0.9 per cent salt solution. Two and one-half cubic centimeters of the citrated blood were added to 10-15 cubic centimeters of the meat infusion agar which had been melted. Three routine Petri plates were made. The remainder of the citrated blood was added to 10-15 cubic centimeters of dextrose broth.

Table I shows that of the 115 cases, 39 or 33.9 per cent recovered and 76 or 66.1 per cent died. Of the 44 cases under twelve years of age, 23 or 52.2 per cent recovered and 21 or

47.8 per cent died; that is, more than half of the children recovered. On the other hand, in the 71 patients over twelve years of age, approximately one-quarter recovered and three-quarters died; that is, 16 or 22.5 per cent recovered, 55 or 77.5 per cent died.

In table II the cases are subdivided into bacteriological groups. Taking the streptococci as a group—at the present time the most commonly detected blood stream infection—there were 86 cases, 33 being in children and 53 in Of the children, 20 or 60.6 per cent recovered, while 13 or 39.4 per cent died; that is, practically two-thirds of the children recovered. Of the 53 cases in adults, there were only 12 recoveries or 22.6 per cent, and 41 deaths or 77.4 per cent, nearly three-fourths of the cases therefore being fatal. In the streptococcus hemolyticus group, 80 per cent of the adults died and only 37 per cent of the children, whereas in the streptococcus viridens group, 77 per cent of the adults died and only 50 per cent of the children. The rest of table II shows a better prognosis in children with positive blood stream infection other than the streptococci; more than one-fourth or 27 per cent of the children recovering, while in adults

less than one-fourth or 22.2 per cent recovered. The pneumococcus cases were those in which a blood stream infection was found. Here, the number of cases being small, 80 per cent of the children died and 57 per cent of the adults. All but one with a staphylococcus blood stream infection died.

The apparent causes of the septicemia of the

dren evidence a greater resistance to this virulent organism than do adults.

In table IV the cases are classified, not only according to the various organisms found, but are also divided into the various age groups. It may be seen that the prognosis is much better from two to five years of age than it is at any age, and that the worst prognosis is in adults over fifty.

#### OCULAR BIRTH INJURIES\*

By MAX W. JACOBS, M.D., ST. LOUIS, MO.

A STUDY of obstetrical histories reveals the interesting fact that ocular injuries, unless severe or very apparent, remain all too frequently unmentioned in the summing up or on the face sheet of the record. The sequelae of such injuries may be of great importance both visually and cosmetically, and should therefore have the most critical supervision and attention. Ocular symptoms may be of very definite value in making a diagnosis of intracranial trauma, while prompt repair of a lid injury may be the means of preventing additional damage to the eye-ball. The discovery of a large retinal hemorrhage, especially when located in the macula, may occasionally enable us to prevent impairment of vision in that eye or at least explain an amblyopia later

Reports of ocular injuries in the newborn were gathered from the literature nearly a generation ago by Wolff and Goldwasser, and these publications, together with the work of Thomson and Buchanan, have served as the basis of most of the literature which has appeared in recent years. Ehrenfest, in his volume on Birth Injuries of the Child and in the Cumulative Supplement of Gynecological and Obstetrical Monographs, has brought the literature up to practically the present day. The data of these men must necessarily form the basis of any paper which reports the various types of ocular injury found in the newborn. Seissiger, in a recent investigation, found no ocular injuries other than those in the eyegrounds in five hundred cases. He also quotes Wolff, who found only six cases of eye injury amongst 39,317 deliveries at the Charité.

The ocular symptoms associated with injuries of the newborn may be best described by arranging them according to the particular tissues involved. Injuries of the lids may vary from simple bruises to actual lacerations. Practically all of us have seen the terrific swelling of face and lids following certain types of labor, particularly in face presentation. The rapidity with such phenomena disappear without leaving any permanent injury is also known to most of us. On the other hand, pronounced suffusion of the eve-lids is possible evidence of a deeper injury of the orbit itself. Again, after lid lacerations or fractures of the upper jaw following the use of forceps, the danger of entropion and ectropion must be born in mind.

Rowland recently stressed the relative im-

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 3, 1930.

portance of forceps in those cases showing contusions, facial paralysis, and hematoma. Lagophthalmos from facial paralysis has been noted in 10% of forceps extractions. This symptom is rarely as pronounced as in the adult individual, and the seventh nerve usually approaches the normal in a short time. Wolff and Goldwasser found in the literature twentyeight instances of orbital fracture and thirty of traumatic exophthalmos out of a total of 244 cases of serious eye-injury. Actual luxation of the eye-ball was excluded in making up these lists. A case of exophthalmos reported by Doersler presented symptoms suggestive of intracranial fracture. When actual luxation occurs, the condition may require external canthotomy before replacement of the eye-ball. In one case an eye luxated during labor was replaced by means of slight pressure. Normal pressure against an unusually elastic frontal bone was apparently to blame for the luxation. The vision of this eye, tested after 18 years was found to be normal. Avulsion of the eyeball has been reported. This may be produced by the blade of a forceps, or the eye may be severed from its attachments by a piece of fractured bone from the orbit. All of us will recall the classical example mentioned in the text books, in which a careless examiner has forced an eye from the orbit during vaginal examination. An anomaly of the pelvis, in the form of a sharp ridge, has also caused this disaster.

As the extrinsic eye-muscles are not fully developed at birth, one may not infrequently get a variety of apparently abnormal muscular conditions in the new born infant. Strabismus, seen frequently at birth, may be due to extreme weakness or anatomic defect rather than actual paralysis. According to Ehrenfest, paralysis of the external rectus muscle present at birth is more likely to be of traumatic origin than truly congenital. The abducens is probably compressed in the sphenoidal fissure where it enters the orbit, and especially when forceps are applied obliquely. We must not forget, however, that injuries occur in the course of labor which has apparently been normal. Gifford, in a review of the literature on Congenital Abduction Defect, calls attention to the theory that intrapartum pressure may within a few hours result in maldevelopment of the external rectus. He stresses this fact because many observers have attributed this weakness to failure of development in utero. Nystagmus is occasionally met with in intracephalic hemorrhage, but rhythmic lateral movements are not uncommonly observed in infants seemingly normal at 1:th. This is probably due to lack of synergistic function which is necessary for co-ordinate movements of the eyes. Ehrenfest warns that the interpretation of a unilateral miosis or midriasis for the purpose of localization is very unreliable. He says that extreme contraction of one pupil, together with strabismus or nystagmus, can be seen in many case of cranial hemorrhage in the newborn. Some of the effused blood, especially in hemispheric hemorrhages, is likely to reach and to irritate the cortical center of co-ordinate ocular movements in the gyrus angularis at the end of the temporal sulcus. For this reason, a widely dilated pupil renders the prognosis particularly bad.

Compression of the eye-ball, hemorrhage into the anterior or posterior chamber of the retina have also been noted. Not rarely the cornea shows changes the result of birth. Opacities of parenchyma following injuries of the corneal surface have been recorded as have tears of Descemet's Membrane after forceps, which Thomson and Buchanan have shown, may result in a high degree of astigmatism. A steaminess of the cornea, with or without abrasion, has been noted after the use of nitrate of silver for the prevention of blenorrhoea neonatorum. Recent tears of Descemet's Membrane were first described in 1891 by Haab, and similar reports have been made since by Thomson and Buchanan, Stock, De Schweinitz, and Seissiger. Stock saw a case of keratoconus following tears of Descemet's Membrane, the result of forceps. De Schweinitz reported a case of keratoconus-like bending of the cornea following instrumental delivery and a similar case was seen by Richter. In all of these cases seen at birth, a diffuse cloudiness of the cornea ascribed to edema was noted. Rupture of Descemet's Membrane is best seen in cases of hydrophthalmos. In such eyes, of course, the injury is due to stretching of the entire eyeball. Thomson and Buchanan examined four eves microscopically and found such tears. In recent years, James, Chance, Byers, Bedell, Blaaw and others have examined patients who showed, many years after birth, linear opacities and folds of Descemet's Membrane. In the more recently reported cases, the slit lamp was of distinct value in localizing and describing this condition. In practically all of these patients a history of injury of the eye at birth, with definite clouding of cornea or bruising of the lids, were available. Chance's patient, after an instrumental delivery, still showed in adult life, loop-shaped scars over each temple. This patient's head also had remained misshapen for many days after birth. In Blaaw's case, Marlowe, who had seen the patient shortly after birth, reported a marked opacification of the cornea on the tenth day, and slight haziness six months later. These patients show in later life, fibre-like processes in the cornea. With the slit lamp these appear as glassy ridges, or resemble glass splinters, which frequently protrude into the anterior chamber.

Our present knowledge of the appearance of intraocular injuries in the newborn came with the ophthalmoscope. Jaeger, in 1861, made the first examination of this kind, and a number of publications appearing since that date stress the frequency of retinal hemorrhage. The percentage of frequency varies greatly in the reports of different investigators, and this is due to the fact that the time of examination has varied with different writers. All are agreed that these are fresh hemorrhages and did not develop during intrauterine life. Schleich asserted that the retinal hemorrhages are the result of congestion and therefore stand in relation to the minute and larger cerebral hemorrhages. Sicherer, who recently examined a large series of infants, agrees with him. The ophthalmic vein does not empty in the normal manner when there is compression of the cavernous sinus. The central vein of the retina, as a rule without anastomoses, is still more unfavorably situated. Sicherer found confirmation of Schleich's theory in the fact that hemorrhage is more likely to occur in the right eye when we have the more common left anterior occipital presentation. The opposite findings were found in the right anterior presentation. This would seem to prove that the eye lesion is more frequently found on the side on which the sinus is exposed to greatest pressure. In a paper read before the Ophthalmic Section of the A. M. A. in 1924, I reported the results of the examination of such a series of the newborn. If, as Sicherer suggests, obstruction of circulation takes place in a definite area, with the result that retinal hemorrhages occur on the corresponding side, my finding did not corroborate it. I found retinal hemotrhage in 12% of my series, whereas percentage figures in the literature vary from 3 to 30. Seissiger, in a recent contribution, found 19%. He stresses the importance of contracted pelvis as suggested by Schleich and thinks that length of labor and primiparity are important factors. Eades, in a recent piece of investigation, concludes that operative delivery, especially forceps, is of major importance in producing retinal hemorrhage. As was the case in my series, duration of labor, time of rupture of membranes, contracted pelvis, foetal asphyxia, or syphilis, showed no primary association with retinal hemorrhage. According to Eades, occurrence of retinal hemorrhage in intracranial injury is not constant,

This is probably due ingly normal at Firth. to lack of synergistic function which is necessary for co-ordinate movements of the eyes. Ehrenfest warns that the interpretation of a unilateral miosis or midriasis for the purpose of localization is very unreliable. He says that extreme contraction of one pupil, together with strabismus or nystagmus, can be seen in many case of cranial hemorrhage in the newborn. Some of the effused blood, especially in hemispheric hemorrhages, is likely to reach and to irritate the cortical center of co-ordinate ocular movements in the gyrus angularis at the end of the temporal sulcus. Volume 30 Number 22

### EPILEPSIES: ETIOLOGY AND SYMPTOMATOLOGY\* By WILLIAM T. SHANAHAN, M.D., SONYEA, N. Y.

PILEPSY is not a disease—it is a type of reaction of the human body to different abnormal stimulations; it has various causes, therefore the field of study must be broadened to include the convulsions of childhood, the eclampsia of pregnancy, uremia, asphyxia and other allied conditions. When these are all better understood, there will be more chance of helping the chronic sufferer."<sup>2</sup>

The essential feature of an epileptic seizure is an abrupt impairment or loss of consciousness recurring at varying intervals, often with fairly definite periodicity. In some epileptics, seizures tend to occur in series, and in a few appears status epilepticus, the most serious form and often fatal.

During the convulsive seizure, the individual often turns on the face and may be asphyxiated. Some epileptics, when they arouse after a seizure feel bruised and not themselves in any respect, while others may be perfectly clear and seemingly as well as ever. Some not realizing they have had a seizure, make unjust accusations regarding those about them, alleging they have been assaulted, etc.

As far as injuries during seizures are concerned, any which it is possible for the human individual to experience may occur, fractures and dislocations being particularly common. The epileptic often ventures in places of danger or pursues an occupation which exposes him to injury disregarding warnings as to measures of safety. Sudden and unexpected death often occurs in epilepsy, the expectation of life being considerably less than for the general population.

What constitutes epilepsy? It is generally conceded that there is no single clinical entity to which the name of epilepsy may be applied. While certain theories are plausible, all of For some unknown them lack verification. reason, certain individuals present recurring epileptiform attacks, and others with apparent defects in makeup which should provoke such attacks, are free from them. As epileptiform reactions occur in so many disorders, the diagnosis of epilepsy can be made only after thorough study and observation of the patient. Every reaction in an epileptic is not a phase of that disorder, as he has those common to mankind, few of which are changed as result of epilepsy. It is difficult to draw a sharp line between normal and abnormal reactions. It is apparent to those familiar with epileptics that there is an almost endless variety of seizures. In the great majority, more than one kind of seizures occur.

The cause of a seizure in one epileptic may not be the disturbing element in many—perhaps the majority of others. The CAUSES seem to be what will some day be brought to light. Can we ascertain the cause of the epileptic seizure until we can see the actual metabolic changes of the living cells?

Epileptics considered individually show a variety of dispositions as great as among other people. Fainting and the normal degrees of imperception, absentmindedness, and sleep are gradations of disturbance of consciousness as compared with different types of seizures. In the preseizure period, disturbances of consciousness commence with slight defect in power of attention through dreamy states to complete unconsciousness. The equivalent of a blush may occur within the skull or elsewhere in the body, headache appear suddenly, dry mouth occur in fear, pallor, flushing, altered heart beat and respiration, intestinal disturbances and other symptoms occur in emotional states, so in some individuals a similar disturbance of the autonomic nervous

system may cause seizures. Considering the complicated, intricate nervous system, as well as the circulatory, digestive and other vital systems with their interrelationship, it is remarkable that there are not more reactions epileptiform in nature. The brain itself may be normal but its functional response may be perverted by toxins of various sorts and from numerous sources. Congenital factors, or those acquired at an early age, may prevent normal development of essential organs of the intricate human mechanism, particularly the central nervous Disturbance of body chemistry, either confined to a part, e.g., the brain or elsewhere, and indirectly affecting the brain through the circulation, etc., is a matter of debate. In all probability the symptoms in such conditions are due to an interplay of certain factors acting on the central nervous system.

Factors pertaining to heredity and environment are too often discussed on insecure foundation. If such close physical resemblances in form and feature occur, as they do, between parents and children, we may assume that tissues with similar tendencies in reacting to various influences are likewise transmitted, or are found in members of a particular family. We have as yet, however, no scientific acceptable verification that such is the situation

Read at the meeting of Eighth District Branch, Medical Society of the State of New York, at Perryaburg, N. Y., on October 2nd, 1930.

as refers to convulsive disorders. Contrarily, as our knowledge of the epilepsies increases, hereditary factors tend to become less im-

portant.

Among 8024 patients thus far admitted to Craig Colony, 38 have been one of twins; 85 had relatives also patients, these representing 42 families. In about 10 per cent of our patients is a history of other members of the family having had one or more convulsions.

The well-known condition of convulsibility in infancy may appear at a more advanced age, perhaps consequent upon damage to the central nervous system, following infections of vari-

ous kinds.

Too rapid growth may be a determining factor in certain cases. Exhausted children faint from cardio-vascular failure.

Convulsive attacks first occurring after 30 years are, as a rule, due to cerebral arterio sclerosis, cerebral syphilis, intracranial tumor, abscess, uremia, alcoholism, or in a woman before the menopause, eclampsia.

In the petit mal seizure, there is for a moment a loss or impairment of consciousness, with dilatation of the pupil and perhaps a slight change in color of the face, the seizure is of such brief duration that such an attack will often pass unrecognized as the patient seldom falls. In the comparatively infrequent psychic seizure there is no convulsion.

Some seizures are incomplete or abortive, e. g., the patient feels something is about to happen, knowing that this sensation (aura) usually precedes the attack, but finds that the remainder of the seizure does not appear. This aura may recur several times within a few hours, finally a severe convulsion occurring. It has long been recognized that changes in conduct and appearance foretell a seizure in many epileptics.

As to the time of occurrence of seizures, the terms nocturnal and diurnal should be replaced by terms defining the periods when the individual may be either asleep or awake.

Mental disturbances in the epileptic may be brief or may last for an extended period. The epileptic in a furor or in an automatic state following a seizure, may without warning make an unprovoked assault on those about him or anyone who may in any way interfere with him. He may thus do harm to those who attempt to control him. In some of these periods, the patient is apparently only confused and does not become very active. Others have hallucinations, illusions and delusions with intense physical activity.

Transitory periods of mental disturbance, ill humor, dreamy states, semi-stupor, assaultive tendencies, impulsiveness, motor hyperactivity are seen in some epileptics. Exalta-

tion of religious sentiment, strangely contradictory to the irritability, suspicion, egotism, etc., may be observed.

Automatism is a symptom often unrecognized and in the ordinary descriptions of epilepsy is not mentioned. This condition is a later stage of a seizure, usually the mild or the incomplete severe attack. Ordinarily in a very brief time, the patient returns to his usual mental state with no recollection of what transpired during the seizure, including the automatic state itself. Many of the assaults which epileptics make, occur, no doubt, during these automatic periods. It may be possible during this condition to have some accident occur which may be fatal. Many experiences occur to an epileptic as a result of unrecognized automatic periods.

Over those who have manifested a tendency toward convulsions, showing an unstable nervous system, there should be a careful control exercised, especially at puberty and involution. The diagnosis of epilepsy is obviously of great importance in certain occupations, e. g., railroad and street car workers, automo-

bile operators, barbers, etc.

Claims for a specific physical and mental makeup in epilepsy are not generally accepted. Some do present a picture suggesting disordered metabolism, e.g., coated tongue, peculiar, unpleasant odor of person, hebetude, low blood pressure and subnormal temperature. The so-called plateau speech of epilepsy is rarely heard, but slow speech and movement may be noted in some.

Epileptic seizures, as some psychotic states, may at times be an attempt to retreat from

the immediate environment.

Common experiences, e.g., crying spells with some cyanosis, night terrors, and certain dream states, associated with restless sleep closely resemble an epileptic reaction. Sleep starts—"jerks"—tics—choreiform movements all closely resemble the normal start made upon hearing an unexpected loud noise or witnessing a distressing situation, or even an unexpected pleasant one, e.g., meeting a near or dear friend or relative. Consider the emotional reaction to sudden good or bad news.

May influences so readily causing convulsions during early life reappear in after years? What induces long periods of freedom from seizures in patients receiving no sedative, diet-

ary or other definite treatment?

The symptoms of epilepsy are in certain respects suggestive of some chemical substance, or substances, acting recurrently on the central nervous system. Disturbances of metabolism reported in epileptics are also found in non-epileptics.

Most information recorded regarding epi-

leptics refers particularly to those in institutions, a comparatively small group. Much further study must be made of the extra-institutional majority.

There are many phenomena, epileptic in na-

ture, besides the severe convulsion.

The principal etiological factors still seriously considered in relation to convulsive disorders are heredity, disturbances of prenatal environment, birth injuries, mal-development during infancy, infections in early life, allergy, mal-nutrition, rickets, tetany, spasmophilia, head injuries, partial asphyxias, psychic factors, circulatory derangements, gastro-intestinal disorders, endocrine disturbances during puberty and adolescence, inadequate physical and mental hygiene.

Adolf Meyer<sup>7</sup> says "Heredity is difficult to evaluate; birth injury and trauma do not seem to count for so very much." "Infectious diseases of childhood count, but how avoid

them?"

It is but to be expected that there will always be some of the human race presenting evidence of an abnormally functioning central nervous system and a certain number with imperfect, incomplete and defective development of the nervous system and systems relating thereto, preventing their properly adjusting to life. How many are potentially epileptic? Are more symptomatic epilepsies remediable or preventible?

Eventually, more convulsive reactions may be found due to cardiac disturbances where such is not even now suspected. 'Varying degrees of convulsive disorders and faints, are observed accompanying certain abnormally slow action of the heart. Cerebral arteriosclerosis, especially when associated with high blood pressure, causes convulsive seizures. What degree of faulty circulatory balance is necessary to produce seizures or to prevent Muskens says in epilepsy we occurrence? have to regulate an organism whose normal reflexes have gone astray. Severe throat infections provoke seizures. Brain damage in pertussis predisposes to epilepsy. How prevent formation of seizure habit in such?

If the cerebrospinal fluid contains convulsants at recurring periods, these by diffusion, or otherwise, may enter the cerebral cortex and convulsions follow. The maintenance of the acid-base equilibrium of the blood is a complex process involving excretory mechanisms; respiratory and circulatory tracts, body tissue, as a whole, to the blood itself. Ketosis, instead of being avoided, is now sought in an effort to treat epilepsy.

The blood, urine, spinal fluid, etc. in epileptics, have thus far revealed nothing to consider specific for epilepsy. The claim that allergy

causes some epilepsies has not been fully verified as the two conditions may well co-exist without being related. There may be a close relationship between gastro-intestinal disorders and the occurrence of convulsions. Many epileptics, however, do not show any material disorder of the digestive tract. The same applies to organic cardiac disorder, blood pressure, etc. Seemingly, many institutional epileptics have a low blood pressure, and low basal metabolism. The epileptic may have evidence of an old skull fracture as result. rather than cause of his epilepsy. Munson.3 and others, have shown that at autopsy the alleged changes in the pituitary fossa and gland, as shown by x-ray, were not present. If pituitary disorder has anything to do with the occurrence of convulsions, such cases must be exceedingly limited in number. Endocrine glands are very important but we know little as to their relation to epilepsy. It is of interest to note the rarity of diabetes and exophthalmic goitre in epileptics. It may be that in some epileptics at least, deficiency of functioning of the liver has to do with the recurrence of seizures.

Felsen<sup>4</sup> points out, "A delicate balance is maintained by the antagonistic action of the autonomic (vagotonic) and sympathetic systems at the most quiescent or normal intervals of the interparoxysmal stage. At known intervals preceding and following a seizure, this balance seems to be disturbed and one system or the other predominates its action. It is not unlike a delicately adjusted thermostat that

suddenly gets out of order."

Continued investigations pertaining to ingestion of food, its digestion, absorption and assimilation; the blood and lymph in their various phases; changes in the liver, pancreas, thyroid, pituitary, adrenal and other glands, with secretions therefrom, the activities of the kidneys, bowel, skin and lungs, may ultimately elicit some departure from what is considered normal.

Absence of a lesion in the brain of the socalled essential epileptic has never been proven. Brain pathology as reported is inconstant and insufficiently verified. Many feel that changes reported are the effect and not the cause of epilepsy. Thorough neuropathological examination of large series of various types of convulsive cases, including those of short as well as long duration, should be made. Brain damage may be conceived as ensuing from circulatory disturbances, edema and altered nutrition incident to recurring convulsions, therefore every effort should be made to prevent seizures. Consider the vast number of nerve cells in the brain and that all parts of the cerebral cortex are connected in the most

intricate way. With recurrence of seizures, with a similar order of invasion, may not structural changes occur in these relationships and seizure more easily occur? Convulsions are readily produced experimentally, or otherwise, in animals. These reactions closely resemble those observed in man. No race or age of man is exempt from convulsive manifestations.

Interaction of various predisposing and precipitating etiological factors needs cautious interpretation. Constitutional reaction types are accepted for many conditions, why not for epilepsy? The constitution has been defined as the sum total of the internal factors which make up an organism. Practically all children receive more or less trauma at birth. What is physiological and what pathological, especially in primiparous births? That lesions of the brain occur during birth is generally ac-There may be hemorrhages in the substance of the brain or in the meninges and The new-born child's their blood channels. tendency to bleed, especially if premature, is greatly increased by asphyxia. Children having a stormy postnatal period often show subsequently evidence of brain lesions. One must then consider damaged germ plasm, faulty fetal development, brain injury during birth and subsequently, malnutrition during early life, disturbed tissue water balance, altered formation and elimination of cerebrospinal fluid, dysfunction, psychogenic cerebral circulatory disorders, seizure habit, degrees of convulsibility, unusual fluctuations in consciousness, difficulty in differentiating normal and abnormal reactions, a disorder of the entire individual.

According to S. A. K. Wilson<sup>5</sup>:

"The transient cerebral anemia is not sufficient to initiate convulsions. If this is the cause per se, then why is not every death bed the scene of convulsive seizures? The core of the situation lies in qualities of the neural mechanism exhibiting the discharge. It is impossible to find one single common factor for the totality of epileptic manifestations."

In the brains of chronic epileptics, diffuse atrophy is often found. Speilmeyer<sup>®</sup> points out there are focal perivascular areas of necrosis, with consequent cerebral destruction following each attack. Excessive cerebral spinal fluid in the subarachnoid spaces merely replaces shrunken brain tissue. Frazier<sup>7</sup> questions the propriety of subjecting a known epileptic to the discomforts incident to encephalography. Fay<sup>®</sup> reminds us that the intermittent occurrence of convulsive seizures indicates that the factor responsible for predisposing a patient to a convulsion at one moment is absent during the period when he is free from attacks. He believes the variable fac-

tor has to do with water metabolism. He believes that the disturbance in relation between the cerebral spinal fluid formation and absorption results in epilepsy. Dilated ventricles are commonly found in epilepsy. It is of interest to note in this connection, however, that the majority of hydrocephalics do not have seizures. In brain tumors, attacks are relatively more frequent if the parietal, frontal, or temporal lobes are involved rather than the occipital.

The commonly obtained history of head trauma is difficult to evaluate as to its bearing, if any, on a later epilepsy. It is often not especially severe, nor does it differ in any respect from trauma received by practically all young children. The fall often ascribed as the cause of the first seizure may rather be the onset of that seizure.

Penfield. describes, after damage to the brain, formation of scar tissue densely attached to the overlying meninges, which cicatrix contracts steadily, exerting an influence on the hemisphere and whole brain, resulting in circulatory disturbances and in consequence, convulsions.

Rosett<sup>10</sup> says if there is a general application of data pertaining to birth injury, about one-third of all human beings must sustain some such injury. He and others compare the epileptic seizure with changes in consciousness, occurring in all persons, e.g., sleep, an absorbed person who is largely unconscious, etc. He says "It is impossible to prove an inheritance of a defective nervous system as such, rather a metabolic defect which acts on the nervous system. The sensory and muscular manifestations of the epileptic seizure are not essentially different from the normal thought and action. The convulsive postures and movements of the epileptic when viewed as though the patient were in the upright position are unmistakably integrated into normal patterns of muscular coordination. The more profound the inhibition of the sensory nervous system, the greater the strength of the muscular contractions. He believes the epileptic seizure is a form of the tetanic state.

An individual seizure, or even a series, may apparently be precipitated, or on the other hand held in abeyance, or repressed by emotional reactions. Witnessing attacks in others does not often appear to bring on an attack, in fact familiarity with seizures in others often causes the epileptic to assert his symptoms are less severe. Some look upon their disorder as of great importance, not only to themselves, but to everybody. Even the most intelligent epileptic is so optimistic he too often deliberately disregards advice as to avoid danger. Egotism, faultfinding, selfishness, undue sensitiveness, emotional poverty and the like are marked in some epileptics but in many not evident.

Anxiety, apprehension and fear play a great part in the development of their mental outlook, and also restrictions on their occupation, pleasures and recreations help develop the belief they are abnormal. They become sensitive to criticism and tend toward asocial habits.

In many, there may exist a highly entotional factor, which is associated with physiological and bio-chemical factors. Whatever produces convulsions must act through the central nervous system. It has long been recognized that ordinarily an epileptic is very susceptible to alcohol. Syphilis plays a minor part in producing epilepsy. Syncope is sometimes very difficult to distinguish from epilepsy.

Some observers assert that more seizures occur during damp, sultry weather and during periods interfering with the maximum of outdoor exercise. Others deny such influence. Similar opinions are held as to intercurrent infections, tuberculosis, menstruation, pregnancy, etc., dental ab-

normalities and visual defects.

Quantity and quality of food and liquid may

be closely related to many seizures.

It is exceedingly difficult ofttimes to obtain a satisfactory history of the early phases of an alleged epilepsy. A hastily given positive opinion should be guarded against, although one should not dwell too lightly on the importance of symptoms analogous to those called epileptic. Children manifesting such should be closely observed over an extended period, the general care given being the same as if epilepsy had not been definitely diagnosed. As so many factors must receive consideration, there is much discussion as to the age when it is possible to diagnose epilepsy. Assurance should not be given that "spells" are so light that they amount to nothing. The mildest type of a seizure may be but a precursor of the most severe form. In many, the change in the conscious state is so slight as to escape notice unless the observer is looking directly at the patient at the time of the seizure. A history of repeatedly falling from bed during sleep; having a severe headache on arising, for which no adequate cause can be discovered, these recurring with more or less definite regularity; feeling of heaviness and fatigue, or sensation of having been beaten; finding of blood on the pillow; soreness and perhaps laceration of the inner surface of the cheeks, lips or tongue, suggest the occurrence of convulsions during sleep. Hysterical seizures may occur in an individual who also has true severe convulsions.

The so-called epileptic equivalent may awaken suspicion of epilepsy, but unless a definite seizure is observed, a positive diagnosis cannot be made.

Simulation may be so well carried out as to escape detection by all except the most careful observer. The simulator cannot change his pupils or exhibit rise in temperature, produce

facial cyanosis, ecchymosis, or pronounced stupor of a true seizure. He tends to overdo something usually not pronounced.

Epilepsy is naturally considered a serious disorder, terrifying to patient and onlooker. The patient is constantly fearing recurrence of the seizure, which anxiety must play an important part in leading to the subsequent attack. He should not center thought on seizures, but whenever possible, see himself a useful member of society. Difficulty in obtaining employment or a living results in depression, apprehension and a sense of injus-Repetition of emotional states connected with such situations largely causes the socalled epileptic mental makeup. Such conditions are observable in what we term normal people when there is no opportunity left for interest in the general routine of life. Discouragement must not be mistaken for deterioration.

Congenial occupation and environmental factors lessen seizures. Reposing confidence in and placing responsibility upon the brighter epileptics lessens seizures. Deprivation of normal social contacts and outlets are provocative of attacks. The prevailing prejudice to the point of ostracism toward nervous and mental patients creates antagonistic attitudes in such handicapped persons. It is too often forgotten that in most respects the average epileptic does not differ from those of his social status. With arrest of seizures, self-confidence may be re-established and a return to

a more normal social attitude.

There are many unsolved problems relative to the epilepsies. Time will furnish the an-

swer to at least some.

If a definite structural abnormality of the brain is accepted as the basis of epilepsy, the prognosis is a gloomy one. If on the contrary but a recurring disturbance in function consequent upon a temporary alteration in structure, is present in some of the epilepsies, the outcome is more favorable.

Can present methods of treatment raise the threshold to exclude provoking factors thus reducing or banishing seizure reactions? What predisposing and precipitating factors are, with our present knowledge, controllable? If long continued and organic changes have occurred or there exists defective general development, can recurrence of seizures ever be prevented?

There seems to be present in some persons abnormal "convulsive capacity" varying enormously in different individuals and in the same person from time to time. It has long been appreciated that convulsions are precipitated either by a disturbance in the brain itself or in parts outside the brain that influence that

organ. The exact cause of susceptibility to convulsions is as yet unknown.

As time passes, more and more so-called idiopathic convulsive disorders will be placed

in the symptomatic group.

Because of lack of exact knowledge of the causes of the disorder in the majority of cases, curability depends upon what we understand as "epilepsy." In the absence of definite pathology, it is only a clinical syndrome which may be the manifestation of a variety of conditions some of which are curable. If the percentage of cures is based on epileptics other than those markedly defective and paralytic, the number of controlled cases would be considerable.

Treatment must be individual, with the maximum possible of normal contacts and interests to arouse and sustain mental activities and provide energy outlets; careful administration of drugs, reasonably restricted diet and acceptance of discipline of self as to hygiene of body and mind.

### VASO LIGATION IN CASES OF PROSTATIC OBSTRUCTION

Report of five-year series. Read before the Section of Genito-Urinary Surgery, New York Academy of Medicine, Jan. 15th, 1930. By GEORGE A. CASHMAN, M.D., NEW YORK, N. Y.

TUCH has been written concerning epididymitis in cases of chronic prostatic obstruction, and the various methods of preventing this disconcerting, and sometimes serious, complication of prostatic surgery. I will sum up briefly the conclusions as found in the literature, and then attempt to give you a brief resumé of our experience on the Urological Service at Bellevue Hospital

for the past five years.

That epididymitis is a real problem in prostatic surgery has long been recognized. Proust and Albarran in the last century, and Judd of the Mayo Clinic in 1911 described methods of treating the vas to prevent epididymitis. The incidence of epipidymitis following prostate operations, unaccompanied by some form of vaso-ligation or vaso-resection varies in published reports between 20 and 40%. McKay<sup>1</sup> reported 35 consecutive cases with 33 vaso-ligations. His pre-operative (i.e. before prostatectomy) epididymitis cases were 3; post-operative 5, about 15%; while in the same clinic before vaso-ligation the epididymitis cases averaged 30%. He used the closed method suggested by Alyea at Dr. Young's Clinic, and found that of the 33 cases ligated, 5 developed epididymitis shortly after removal of the sutures in two weeks. Goldstein<sup>2</sup> of Baltimore following the experimental work of Rollnick, advised cutting the sheath surrounding the vas, and removing at least 1 c.m. to prevent extension along the lymphatics, and reported not a single case of epididymitis

in 60 cases of prostatectomy where this procedure was followed before any intra-urethral instrumentation. He gives his general average as 20% without ligation, and 4% with ligation. His conclusions are: 1. Prostatectomy without ligation and partial resection of the vas, results in a high percentage of epididymitis in any form of prostatectomy. 2. Bilateral ligation and removal of 1 c.m. of the vas with its sheath and lymphatics lowered his average to 4%. 3. Such treatment of the vas has no material effect on the sexual powers of these individuals as regards the act.

Ashner's review of 277 cases at Mt. Sinai Hospital without vaso-ligation gives: 44 cases of 1 stage prostatectomy with 10% epididymitis, and 233 cases of 2 stage prostatectomy with 20% epididymitis, of which 15% were post-operative. On the other hand, White reported as high as 80% after 1 stage prostatectomy, but less after the 2 stage opera-

tion.

Recently in the discussion of Dr. Keyes' paper on the "Prospects of the Prostatic," one or two of those discussing the epididymitis phase of it seemed to be of the impression that such a complication was not so common, and discounted the necessity of vaso-ligation Alyea (4) however, reor vaso-resection. ported 100 private cases at Johns Hopkins with a 39% incidence of epididymitis, while at the same time they had only 20% on ward patients in the same hospital. He drew what seems to be a very logical conclusion, that the

ward patients had had their obstruction and infection a longer time with resulting increased resistance; while the private patients were only recently infected and came to operation before their resistance was sufficiently increased by active immunization.

Various methods have been described for preventing epididymitis, such as: Seminal vesiculectomy, ligation of the ejaculatory ducts, and the closed, and open methods of vaso-ligation or resection. In 1925 and 1926 on the Urological Service at Bellevue Hospital an occasional case was done by merely isolating the vas high up in the scrotum, and attempting to interrupt its continuity by ligation with silkworm gut passed through the skin, under the vas, and out through the skin again. However, several infections took place, a fair-sized area would sometimes slough out, and subcutaneoous hematomata occasionally occurred. There were 13 of these cases with 4 poor results. Hence this procedure was soon abandoned for the present method. Now, practically every case of probable prostatic obstruction is taken to the operating room, before repeated catheterization, and prior to the use of the indwelling catheter. There, under strict surgical precautions, the vas is identified high up in the scrotum, and as close to the skin as possible by means of the thumb and index finger; a small amount of one half of 1% novocain is injected, a small incision, about one or two c.m. long is made in the skin and tissues over the vas, the vas and its sheath is caught in an Allis clamp, it is further identified and raised through the skin incision, and Two #0 freed from the surrounding tissues. plain catgut ligatures are tied about it, 2 c.m. apart, about 1 c.m. of the vas and its sheath is removed between these ligatures, and the operator makes certain the cut ends are well separated before replacing them in the wound. The skin is then closed with one or two (generally only one) catgut sutures, and a small amount of collodion is applied to cover the area. Then we are ready to place an indwelling catheter, or to do a suprapubic drainage as previously decided upon.

In this series, the first recorded vasectomy procedure was performed June 4th, 1924, by the open method; then there was an occasional case done by the open or closed methods until July

1926, when the open method became routine on most prostatic cases admitted to the Bellevue Urological Service. The total number of chronic prostatic obstruction cases from June 4th, 1924, to June 4th, 1929, subjected to some form of operative relief was 327, of these, 61, or 181/2%, developed epididymitis. 119, or 36% of this total had some form of vasectomy. Of those not having vasectomy, 52, or 25% developed epididymitis. As stated above there were 13 with the closed method which was abandoned. 106 had the open method of vasectomy, and 5, (or 4 plus percent) of these developed some infection about the scrotum-3 having a definite unilateral epididymitis. This might have happened irrespective of our vasectomy, because many of these patients had histories of old infections, or repeated catheterizations by self, or others with questionable technique, before admission. Nevertheless we are admitting a failure whenever the procedure did not wholly accomplish the purpose for which it was intended. These are the results of not any one operator, but of the entire visiting, as well as the house staff.

In conclusion, we feel at Bellevue: that the open method of bilateral vasectomy is a valuable aid in the surgery of chronic prostatic obstructions, since it is a very minor procedure and allows urethral catheter drainage with decreased possibility of epididymitis, thus enabling the patient to be up and about while he is getting ready for the removal of his prostatic obstruction. To those who object to catheter drainage, I might say that it has decreased the morbidity and mortality experienced during our earlier general suprapubic drainage period, and it has lessened the hospital residence of these patients by allowing a one-stage operation, with a more rapid, permanent closure of a relatively clean supra-

pubic wound.

the profession of medicine must again recognize the tremendous force of public opinion in health matters. Throughout this meeting the importance of the doctor in relationship to all health influences stood out. While there was a large attendance of medical men present, and while New York State was represented by ninety-four people, a majority of them doctors, I cannot help wishing that the profession of New York State could have caught the value of the essential relationship of the profession in present-day social medical trends.

WILLIAM H. Ross.

#### THE HIPPOCRATIC OATH

Condemnatory criticisms of the Hippocratic Oath frequently appear in current periodicals, some of them written by physicians who confess that they cannot recall the words of the oath, or even the subjects included in it.

The oath bears the same relation to the Principles of Professional Conduct of the Medical Society of the State of New York, and the Principles of Medical Ethics of the American Medical Association, that the Ten Commandments bear to modern law. It is ascribed to Hippocrates—that Moses of modern medicine—who was at the height of his activity in the year 400 B.C., a thousand years after the giver of the moral law wrote his code. While the codes of statute law and of medical ethics are constantly being changed, the underlying principles stated by Moses and Hippocrates are as applicable today as during the times of their authors.

The Hippocratic Oath deals with seven topics whose individuality is likely to be missed by the reader on account of the usual lack of paragraphing in the printed copy.

Paragraph one reads as follows:

"I swear by Apollo the physician, and Æsculapius and Hygeia and Panacea, and all the gods and goddesses, that according to my ability and judgment I will keep this Oath and this stipulation—to reckon him who taught me this Art equally dear to me as my parents—to share my substances with him and relieve his necessities if required—to look upon his offspring in the same footing as my own brothers, and to teach them this Art if they shall wish to learn it, without fee or stipulation—and that by precept, lecture and every other mode of instruction, I will impart a knowledge of the Art to my own sons and those of my teachers and to disciples bound by a stipulation and oath, according to the Law of Medicine, but to none others."

This paragraph deals with the most modern and up-to-date principle—that the physician shall give free instruction to all those who are "bound by a stipulation and oath, according to the Law of Medicine, and to none others." The "stipulation and oath" in New York State in these modern days are applied with great strictness to med-

ical students and physicians by the Department of Education.

The second paragraph reads:

"I will follow the system of regimen which according to my ability and judgment I consider for the benefit of my patients, and abstain from whatever is deleterious and mischievous."

No one can find fault with this principle of practicing medicine consistently.

The third paragraph is:

"I will give no deadly medicine to any one if asked, nor suggest any such counsel; and in like manner I will not give to a woman a pessary to produce abortion."

Physicians of today condemn the abortionist quite as strongly as did Hippocrates.

Paragraph four defines the gentleman that every physician is supposed to be, as follows:

"With purity and with holiness I will pass my life and practice my art."

Paragraph five deals with the question of surgery done by those who are unskilled and unqualified according to the standards of the times. It reads as follows:

"I will not cut persons laboring under the stone, but will leave this to be done by men who are practitioners of this work."

Lithotomy was the type of the most severe major operations done in the time of Hippocrates. The American College of Surgeons would make this paragraph apply to hysterectomy and all other major operations.

The sixth paragraph reads as follows:

"Into whatever houses I enter, I will go into them for the benefit of the sick, and will abstain from every voluntary act of mischief and corruption, and further from the seduction of females or males, of freemen and slaves."

This paragraph may appear to be an anachronism, unnecessary in these modern times. But the wise doctor, no matter how upright he be, will always have a witness at every examination that he makes, in order to avoid false accusations. It is to the glory of the medical profession that people today believe that violations of this paragraph are of extreme rarity.

Paragraph seven reads:

"Whatever, in connection with my professional practice of the Art respected by all men, I hear in the life of men which ought not to be spoken of abroad, I will not divulge, as reckoning that all such should be kept secret."

The principle stated in this paragraph is incorporated in the Statute Law of nearly every civ-

ilized country.

Like all other ancient oaths, that of Hippoc-

rates closes with a penalty, to which, however, every modern doctor subscribes with his whole heart.

"While I continue to keep this Oath inviolate, may it be granted to me to enjoy life and the practice of the Art respected by all men in all But should I trespass and violate this Oath, may the reverse be my lot."

The Hippocratic Oath is surprisingly modern

in all its parts.

#### NEWS IN THE STATE JOURNAL

The object of a state medical journal has been a topic for discussion in the Tri-State Conference of the representatives from New York, New Jersey and Pennsylvania, and also of the national conference of the secretaries and editors from all the states conducted annually by the American The repetitions of the Medical Association. discussions might be interpreted as indications of grave differences of opinion. But actually the committees and editors are unanimous in their opinions regarding fundamental principles.

Every state medical journal is the organ of its state medical society and the constituent county societies. Its most evident object is to promote the newer activities of the societies. There are four great movements which are emphasized by

every state society:

1. Graduate education;

Public relations;
 Medical economics;

4. Medical legislation.

Many states also engage in other activities, such as popular health education, woman's auxiliaries, medical history, and social events.

All these subjects constitute the news departments of the state medical journals. They partake of the nature of the items in daily newspapers, and a doctor must follow them in every issue in order to grasp their continuity, yet they also have a permanent value, for the state journals are the principal sources of information regarding the medical societies.

Most physicians judge a state journal by its scientific department. They glance through the index and read only those articles which appeal

to their experience and inclinations.

The New York State Journal of Medicine has adopted a practical method of endowing its news department with the value and appeal of its scientific section.

1. It chooses the items for their value as contributions to medical society records and their universal appeal to physicians throughout the state.

2. It dignifies each item with a double column

heading, and a listing in the index.

The readers of the New York State Journal of Medicine are assured of the practical importance of every news item.

#### LOOKING BACKWARD

#### This Journal Twenty-five Years Ago

Journal and Directory: This Journal of November, 1905, contains a report of the finances of

the Journal and Directory, as follows:

"The cost of publication of the Journal-that is, the expense of printing, postage and wrapping and addressing-amounts to \$2,654.42; to this must be added rent, stationery, commissions on advertisements and salaries of \$821.78, making a total expenditure of \$3,476.20. The receipts from advertisements were \$2,889.69; sales \$4.75, a total of \$2,894.44. Thus the actual cost to the Association was \$581.78, and the cost per member for twelve numbers is 32 1-3 cents.

"The Medical Directory has met with the usual satisfaction of the members; the list of registered physicians is increasing every year, and to keep the volume within reasonable size it has been necessary to limit the data therein. The same plan as adopted in the last volume has been carried out in Volume VII, and has met with universal approval.

"The expenses of the 1905 Directory are: For stationery and sending out cards for data, \$690.66; rent and salaries, \$734.02; for printing, 1904 Directory, about \$2,839.18; for delivering the 1904 Directories and commissions on advertisements, \$350.42; the total expense being \$4,614.68; the receipts for advertising \$667.50; sales of Directories, \$1,216.

"Total receipts, \$1,883.50. Cost to the Association, \$2,730.78, making the cost per volume

about \$1.84."

# MEDICAL PROGRESS

A Method of Treating Chronic Dry Pharingitis.—H. Erdmann, in the Schweizerische medizinische Wochenschrift of August 30, 1930, recommends inhalations of a solution of iodol or iodipin, 0.5-1.0 gm., and menthol, 1.0 gm., in olive oil, 10 gm., for those persons who suffer with chronic dry catarrh of the nasopharynx and who on every least change of the weather find their hearing less acute because of dry chronic irritation of the eustachian tubes. When this preparation is sprayed into the nose by means of an oil atomizer, nasal breathing is promptly improved. A special oil inhalator makes it possible to introduce definitely dosed amounts of oil into the nasopharynx with the pump, which can be regulated for strong or weak action. The nasal passages soon become permeable if the lower part of the nasal muscle is massaged against the septum and then another inhalation made, letting the atomized oil penetrate every portion of the naso-If the patient intones the syllables pharynx. or "klara, klara" alternately "kakuk huk" through his nose during the inhalation, the hearing is usually improved soon thereafter. In cases where the eustachian tubes are more seriously damaged, and catherization is necessary, this procedure is much less disagreeable to the patient if the parts have been previously sprayed with the oil solution, and there is the further advantage that the oil is carried into the tubes. treatment the subjective symptoms are greatly relieved by the liquefying of the secretions in the nasopharynx, and the itching and frequent clearing of the throat disappear with the dryness. The solution causes an agreeable sensation and has no irritating effects. The oil seems also to have a phophylactic value in the first stages of colds in the nasopharynx and tonsils. At all events, apart from a certain disinfecting value, the inhalations bring great relief of symptoms and their wider use is recommended.

The Treatment of Chronic Deafness with High Frequency Sound Rays.—Hamm, writing in the Klinische Wochenschrift of September 13, 1930, reports that he has been using for a year with very encouraging results an apparatus invented by Mülwert and introduced by Voss, in which high-frequency sound waves lying above the limits of human hearing are utilized for therapeutic purposes. The method is especially applicable in the early stages of deafness following infectious diseases, such as grippe and measles, in which the general practitioner is the first to observe the symptoms. Six to fifteen treatments over a period of 1 to 2 months suffice in most instances. In deafness following

middle ear suppurations and radical mastoid operations hearing has been completely restored or so greatly improved as to give no further serious trouble. A remarkable case was that of a man of 50 who had been totally deaf on the left side for 8 years after a radical operation for cholesteatoma, and partially deaf on the right side for 3 years after a conservative operation for the same. This patient was able after 20 treatments to hear a watch on both sides at 36 cm., a whisper at 250 cm. and conversation at 4 meters' distance. The cure has been maintained for 10 months. Cases of beginning old-age deafness and tinnitus aurium have yielded satisfactorily to treat-Particularly good results have been obment. tained in children, who readily cooperate. nerve deafness where the acusticus and its branches are affected, results are good if the case is not too far advanced. The author's results in otosclerosis have not been encouraging, although Voss reported 2 remarkable cures. Occupational deafness showed a tendency to recur after 5-6 months, but again yielded to treatment. It is not easy to say just how the method accomplishes its Mülwert has suggested that a pressure effect may be exerted upon the organ of Corti or upon the endolymph, or that a purely mechanical shaking up of the Corti fibers takes place, while Voss thinks the action may be exerted upon the vessel walls. Whatever the explanation, the author claims that the apparatus represents one of the greatest advances ever made in the nonoperative treatment of deafness.

The Synthetic Activities of the Animal Cell.-H. C. Raper, writing in The Lancet, September 6, 1930, ccxix, 5584, points out that the animal cell, unlike the chemist, has a very limited choice of raw materials from which synthesis must start. After the preliminary process of digestion, the common foodstuffs provide in all some thirty substances—about 20 amino-acids, 2 purine bases, 3 pyramidine bases, 3 hexones, glycerol, and higher fatty acids. Very little is actualy known concerning their synthesis. process, however, by which the protoplasm of the cell is built up is one which must be closely allied to protein synthesis, since protoplasm is constituted for the most part of amino-acids; united so far as we can ascertain by the same sort of linkage that we find in proteins. There are theories in favor of the idea that the protoplasm of the cell is not living in the sense which the nucleus is, and therefore is less likely to be the seat of certain synthetic processes. There is no evidence that irritability as a manifestation of what we call life is more than the possession of

extremely labile structures which are sensitive to minute environmental changes. The nucleus, on the other hand, is essential to the continuous life of the cell and its growth. It synthesizes aminoacids to serve special as well as certain general requirements. This theory does not solve our difficulties; it merely narrows down the possible sites in the cell in which synthesis may occur. Most biologists agree that the cell has arisen by a process of evolution from something simpler and eventually from non-living materials. If we regard the nucleus as the only living part of the cell then we may regard protoplasm as something that has been acquired or developed in the process of evolution but is now necessary to its existence. We do not know definitely of nuclear material that is living and devoid of its protoplasmic envelope, unless such an arrangement exists in bacteria. The investigation of filterable viruses has given an indication that material possessing the prime attribute of life, the power to reproduce itself, exists possibly in simpler forms than we find in the smallest visible organisms. The chemical characters of filterable viruses may resemble those that are found in the nucleus of the cell. The ability to synthesize protein may be a property which living material acquired only at a late stage of its evolution, and that property may be the one which in the process of time has come to be essential for the maintenance of the complex structure of the nucleus as we see it today.

Philosophical Considerations of the Gallbladder.-In reviewing some of the recent advances in our knowledge of the gallbladder, Charles H. Mayo calls attention to one or two lymphnodes on each side of the hepatic ducts; if one knows their normal size, their enlargement indicates infection or overwork. There are also one or two lymphnodes on the common bile duct which become enlarged in the presence of disease of the gallbladder, of ulcer of the duodenum, or of disease of the pancreas. It was formerly believed that the gallbladder caused disease of the liver, and it is probably true that the severity of hepatic disease is often increased in the advanced stages of mechanical obstruction involving the common bile duct. We now believe it is more probable that, through hepatic tension, the liver becomes harder and darker, and the thin sharp edges become rounded. Often there is evidence of excessive infiltration on the surface of the liver about the gallbladder and deposits of connective tissue. Thus, it seems that the liver is the primary sufferer in the beginning of the diseases which are finally evidenced in the gallbladder. Nevertheless, it may be wise to preserve and drain the gallbladder in cases of acute illness. If there is general evidence of chronic hepatitis, the biliary tension can certainly be lowered by removal of the gallbladder together with half of the cystic duct. Through experimental research and clinical observation it has been proved that surgery for disease of the liver, although directed against an extensively diseased gallbladder, is a dangerous procedure. When a hardened granular or cirrhotic liver is present, one of its major functions must be thought of, namely, the handling of sugar. If it is felt that sugar cannot be mobilized, the patient should be given a solution of glucose intravenously several times in the first four days following operation. In experimental cirrhosis in animals, life is maintained very comfortably with a limited amount of hepatic substance, so long as plenty of carbohydrate, in the form of syrup, is given daily. When meat is fed to them, ascites develops and they die quickly from toxemia. The condition of the head of the pancreas should be noted in cases of hepatic disease. If this structure is smooth, hard, and large, interstitial pancreatitis may be present.—Annals of Surgery, October, 1930, xcii, 4.

Osteochondromatosis.—To the 82 cases of osteochondromatosis reported in the literature Emmet Rixford adds a case and states that he has learned of several others by personal com-The condition consists essenmunication. tially in the development of cartilaginous masses on the inner surface of the synovial membrane. These differ in size and form in the same and in different cases. They usually consist of great numbers of cartilaginous beds varying from microscopic size to individual chondromata several centimeters in diameter, commonly with a small pedicle and hence are often broken off, becoming loose bodies in the joint. The muscles, aponeuroses, and fascias about the joint may be traversed by the cartilaginous masses, and yet there is no infiltration as in malignant tumors, the collective masses remaining encapsulated. Rixford's case is typical of the condition. The patient, an old sailor, aged 69, recalled having sprained his knee seven years previously. Shortly thereafter the knee became swollen, the swelling slowly increased in size, and great masses of firm tissue developed which he likened to bags of gravel. He had never been disabled and there was practically no pain. The masses the size of a hen's egg, distended the joint and extended out in various directions, one mass having penetrated the vastus externus muscle and its sheath; other masses filled the popliteal space, obliterating the hamstrings. A mass the size of a fat banana extended subcutaneously down the calf for about 15 c.m. roentgenograms showed the bones to have normal contours and to be otherwise normal

except for some demineralization. There was an infinitude of small specks, evidently shadows of particles of calcium, scattered throughout the leg. At operation the entire synovial membrane was found to be involved in the process and was excised, and also the bananashaped mass in the leg. Some of the intraarticular masses were attached to the synovial membrane by long threads; many were loose in the joint. The patient made a rapid recovery, and nine months later had almost no limp, extension was normal, active flexion 45 degrees. The histological examination showed small pieces of hyaline cartilage, with beginning ossification, embedded in fibrous tis-The cellular character of the cartilage and the fact that the entire synovial membrane was involved spoke strongly for an inflammatory origin of the process.—Annals of Surgery, October, 1930, xcii, 4.

The Treatment of Celiac Disease from the Standpoint of Vitamin Deficiency.—C. V. Rice finds that the literature gives no enlightenment as to the etiology of celiac disease. The celiac child, however, seems unable to digest fat, sugar, and starch. There is reason for the belief that the disease may be classified as one of nutritional disturbance brought about by deficiency of vitamins. This is shown by retardation of growth and development, delayed formation of centers of ossification of the epiphyses of the bones, a tendency to early dental caries, atrophy of the muscles, and nervous manifestations. In order to demonstrate the success of treatment based on this theory, Rice describes a typical case of celiac disease in a child 17 months old. He started the child on the first day with 30 ounces of water, 6 tablespoonfuls of lactic acid milk, 4 tablespoonfuls of protein milk, and 1 grain of saccharin. The following day he increased the protein milk and added 2 ounces of sauer-Three days later he added 6 bananas, and a few days after this 1 tablespoonful of a grain-germ sugar. Seventeen days after starting the treatment a tablespoonful of a preparation of powdered spinach, rich in vitamins B and G and in iron, calcium, and phosphorus, was included in the diet. time went on, as large an amount as 12 tablespoonfuls of the spinach were added to the 24-hour mixture without any ill effect. After the child had been on the above diet for about eight months, evaporated milk was gradually substituted for the protein and lactic acid milks. During this period of time, the child increased in weight from 18 pounds 3 ounces to 26 pounds, and improved more rapidly than any other patient with celiac disease whose case has been reported in the literature. This he attributes to the treatment of celiac disease as a condition due to vitamin deficiency. Under this plan, fat (in the form of evaporated milk) and sugar (in the form of grain-germ sugar) can be given early. Kraut juice is used as an acidifier, and also adds minerals and vitamins. — Archives of Pediatrics, September, 1930, xlvii, 9.

Filterable Viruses and Practical Medicine.— In an address before the British Medical Association, S. P. Bedson regretted that much of the speculation on the nature of filterable viruses heightened the mystery which invariably surrounds the unknown. It would be more reasonable to approach the question from the standpoint that filterable viruses are probably akin to bacteria. Like bacteria, they are living, and though some of them are truly inframicroscopic, there is evidence that others—the viruses of smallpox, fowl plague and psittacosis-could be seen with the microscope. There are visible and cultivable bacteria which at the same time are filterable. Thus there is no good reason for separating filterable viruses from the ordinary bacteria on the score of size. Bedson looks forward to the merging of filterable viruses and bacteria into one large group, with sub-groupings. He says it has become the habit to speak of immunity to filterable viruses as being solid and life-long, in contrast to the immunity incited by bacteria which is often weak and fugitive. Such generalization is only partially true, for there are virus diseases such as foot-and-mouth disease, herpes, and the common cold, one attack of which confers little or no immunity, and bacterial diseases like typhoid fever which give rise to a solid one. With filterable viruses, as with bacteria, it is possible to produce an active immunity which is associated with the development of specific antibodies, and with these antibodies it is possible to secure a passive immunity and to demonstarte those invitro immunity reactions which are of such service in bacterial diseases. Prophylactic immunization has been practised for some time in the case of smallpox and rabies. been shown that foot-and-mouth virus still retains its antigenic properties when rendered inactive by means of low concentrations of formalin. The same thing has been found true of the viruses of distemper, fowl-plague, and yellow fever; in distemper prophylactic vaccination has been practised with success. Passive immunity is being successfully produced by the use of convalescent serum in poliomyelitis and measles. Investigations show that specific flocculation and complement fixation can be demonstrated with filterable viruses, and the flocculation test is a valuable aid in the diagnosis of smallpox.—British Medical Journal, September 27, 1930, ii, 3638.

Isolation of a New Pancreatic Hormone.-That the pancreas produces and secretes a hormone having a regulatory effect upon the functional activity of the pneumogastric centers is announced by Drs. D. Santenoise, H. Verdier, and M. Vidacovitch in the Revue française d'Endocrinologie of June, 1930. This hormone is found not only in the gland itself but also in the arterial blood of the general circulation. The vagotropic properties observed do not attach to insulin but are specific for this other hormone secreted by the pancreas. The authors have succeeded not only in demonstrating that insulin proper does not increase the reflex excitability of the pneumogastric centers, but also in extracting from the pancreas after long and painstaking research this vagotropic hormone which they have separated by means of alcohol and the neutral salts from insulin proper. The name vagotonine has been provisionally bestowed upon this substance. Other articles will later set forth the physiological properties of vagotonine by virtue of which the pancreas is said to play a capital role in the regulation of the activity of various organs innervated by the pneumogastric nerve.

Cardiac Weakness and Angina Pectoris .-Hans Kohn says that scarcely ever do persons with cardiac decompensation from any cause suffer with angina pectoris. Angina attacks may even cease if decompensation appears. Nor does an increased strength of the heart, as in congenital stenosis of the aorta with its consequent great hypertrophy, predispose to this affection. If the angina is simple, as in most instances, the pulse and blood pressure may remain unchanged throughout the attack, showing that the heart is strong enough to combat the peripheral resistance. But in complicated cases cardiac weakness is an essential part of the picture, and the patient, independently of the intensity of the pain, is restless, with rapid respiration, air hunger, and pulmonary edema, small, frequent pulse and the systolic blood pressure usually very low. Here it is not precisely the angina that causes the cardiac weakness, but the pathological conditions underlying the angina. Accepting the theory that angina is due to disease of the coronary arteries, which leads to their stenosis, we have reason to believe that spasm is always present, whether the narrowing is organic or only functional. Since this is generally brief, a clinically demonstrable cardiac weakness is seldom present. In complicated cases, however, a new factor is present, consisting of total closure of a branch of the coronary artery by thrombosis, with pain due to consequent spasm. Such total closure results in anemia of the section the artery supplies. Since then it produces necrosis of a certain part of the heart muscle, the cardiac weakness here must be so great that it may finally dominate the entire picture. Strophanthus and digitalis may make matters worse, by contracting the arteries. In simple cases the nitrites relieve the spasm quickly and surely. In case of habituation to these, papaverine and atropine, have good antispastic In total occlusion caffeine and properties. camphor are called for, with possible recourse to strophanthus intravenously. At the close of an attack there should be rest in bed for several weeks with cautious use of digitalis for the heart weakness.—Deutsche medizinische Wochenschrift, September 26, 1930.

Cog-Wheel Breathing .- In an attempt to clarify the position and to assess the value of cog-wheel breathing as a physical sign, T. Hebert studied 1,000 cases, consisting of 428 adult males, 409 adult females, and 163 children under 16 years of age. The inquiry emphasized the fact that cog-wheel breathing is of two kinds. In one the interruptions are irregular, in the other they are regular, that is, they are synchronized with the beating of the heart, and are best termed air-waves. They are heard during inspiration, but only rarely during expiration. Though synchronized with the beat of the heart, and systolic in time, they are breath sounds not heart sounds, for they cease when the breath is held (or during expiration), and the heart sounds may then be audible in their place. In the 1000 cases investigated, air-waves were found in 30 per cent of adult males, in 53 per cent of adult females, and in 19 per cent of children under 16. In none of the cases could the cog-wheel breathing be ascribed to a pulmonary or pleural lesion. It is not caused by tuberculosis of the underlying tissue, but is a physiological phenomenon. The situation of the air-waves and the demonstration of pressure fluctuations, synchronous with cardiac systole, in the pneumothorax cavity of some patients and in the inspiratory and expiratory currents of air of others, suggest that they are caused by an expansion of the lung compensatory to the contraction of the heart. They are best heard near the angle of the left scapula or in the axilla, and sometimes only over a small area and after careful search. In some cases they may be heard around the border of the heart in front, or over the greater part of the left lung. Certain cases of so-called extracardial murmurs and of pleuro-pericardial friction are probably merely instances of air-waves. The possible explanation of such murmurs on the basis of air-waves should always be borne in mind.—The Lancet, September 20, 1930, ccxix,

# LEGAL

#### A SALUTARY DECISION

By LORENZ J. BROSNAN, ESQ. Counsel, Medical Society of the State of New York

The shocking spectacle of perjury is a familiar sight to every practicing lawyer in our courts. Bench and bar alike have united in calling attention to this cancer that is eating away the foundations upon which the administration of justice rests. But why, you may logically ask, does this evil go unchecked; why, if this evil is so clearly recognized, do not the judges and lawyers join in putting an end to it? The answer to these questions lies in the almost total lack of success

attending prosecution for perjury.

Perjury, in its broadest sense, may be defined as a false oath taken before some court or magistrate having competent authority to administer it, in a matter material to the issue or subject of inquiry, and known by the party sworn to be false. Under the Penal Law of this State, perjury when committed on the trial of an indictment for felony is punishable by a term of imprisonment not exceeding twenty years, and in any other case by imprisonment for a term not exceeding ten years. The severity of the punishment set forth in the Penal Law indicates recognition by the Legislature of the harmful effects of perjury upon the sound administration of justice.

In spite of the fact that perjury is rampant in our courts, prosecuting officials are in accord that it is extremely difficult to secure a conviction for perjury. Time and again in the past the judges of our courts have held a witness for the action of the Grand Jury upon a charge of perjury, but either the Grand Jury has failed to indict or else after indictment it has been found impossible to secure a conviction. It can be readily seen how difficult it is for a prosecuting official to prove, as it is incumbent upon him to do, that not only was the testimony material to the issue but that the witness knowingly swore falsely. The history of prosecutions for perjury in our State discloses that juries are extremely reluctant to convict even where the Grand Jury has indicted the witness for perjury.

With these observations in mind, it is refreshing to turn to a decision handed down very recently by one of our judges which constitutes a courageous attempt to correct the abuses here noted. In order that we may appreciate the situation presented by this decision, it is necessary to explain something of the nature of the proceedings out of which arose the decision in question.

Let us say that a physician has rendered a just

bill for services rendered by him to a patient. The patient refuses to pay the bill. The doctor begins an action to recover for the value of the services so rendered. The physician wins the case, and his lawyer enters a judgment against the patient for the full amount of the bill. Still the patient does not pay. The doctor then places an execution in the hands of a sheriff, which in due course is returned unsatisfied; that is, the sheriff has been unable to find any property of the patient upon which a levy could be made to satisfy the judgment. The doctor then has a right to obtain an order from the court to examine the patient in supplementary proceedings with a view to ascertaining whether the patient is concealing any assets from which the judgment may be satisfied.

Any lawyer of experience in examining judgment-debtors is well fortified against optimism with reference to the result of such examination. It is generally futile; and until the decision which is the subject-matter of this editorial, even if the lawyer knew that the judgment-debtor was not telling the truth, he could not do anything about it. This unfortunate situation resulted in part from a decision of one of our higher courts which arose out of the following state of facts:

A judgment-debtor, while being examined in supplementary proceedings following a judgment against a corporation in which he was president, testified with respect to the corporation that he did not know the president of the company; that none of his brothers were stockholders or officers of the corporation; that he did not know any of the controlling officials of the corporation, and lastly, that no member of his family was in any way interested in the company. A few days later a brother of the judgment-debtor being sworn testified that he was employed by the company and had been employed for over a year, and that he had been employed by his brother, the judgment-debtor; and the bookkeeper of the corporation when called testified that the judgmentdebtor was the president of the company and his wife the secretary, and that the judgment-debtor employed the brother and fixed the compensation With these facts as a basis, the for all parties. judgment-creditor obtained an order calling upon the judgment-debtor to show cause why he should not be punished for contempt of court. court below held the judgment-debtor in contempt of court, but upon appeal this decision was

reversed, the higher court holding that the fact that the judgment-debtor did not truthfully answer some of the questions put to him did

not constitute a contempt of court

The judge in the instant case took cognizance of this ruling, but stated that he did not feel bound by it. In the instant case the judgment-debtor untruthfully answered certain questions put to him, whereupon the judgment-creditor moved to punish him for contempt In granting the motion, the court said:

"It is a well settled law that a refusal to answer a question in an examination in supplementary proceedings can be punished as a contempt of court. The distinction between a refusal to answer and a false answer is a distinction without a difference. To be examined under oath in all common sense carries with it an obligation to answer truthfully. If the English language means anything, it means just that. If the sanctity of an oath, the dignity and integrity of the court and the efficacy of its proceedings are to be given their proper and generally accepted value, then the court must possess the power to punish deliberate and admitted perjury. The climax is reached if a judgment-debtor can appear in open court and brazenly admit deliberate perjury and go unpunished. It is only after careful consideration that I have reached a conclusion that may appear to be novel and lacking in precedent. I have some comfort, however, in the inspiring words of a master of jurisprudence: 'Through one agency or another, either by statute or by decision, rules, however well established, must be revised when they are found after fair trial to be inconsistent in their workings with an attainment of the ends which law is meant to serve. The revision is a delicate task, not to be undertaken by gross or adventurous hands, lest certainty and order be unduly sacrificed, yet a task also not to be shirked through timidity or sloth'"

The court imposed a fine of \$250 upon the

judgment-debtor.

This decision, if upheld by our higher courts, provides a summary and salutary method of punshing those who testify untruthfully. While, of course, it cannot be said that it takes the place of a conviction for perjury, nevertheless by assessing a monetary fine against the untruthful witness it will undoubtedly work an effective deterrent against this insidious practice. The decision certainly represents to the lay mind common sense and common justice, and it is to be hoped that it will be upheld by our higher courts

#### CLAIMED NEGLIGENCE IN DIATHERMIC TREATMENT OF LEG

In this case the defendant, a physician and surgeon, specializing in orthopedics and physiotherapy, was consulted by the plaintiff who complained of pain in her left leg. Upon examination the doctor observed that this leg had been shortened about six inches as a result of ankylosis of the hip. Due to this condition she was compelled to wear an extended shoe. As the leg appeared to be sensitive and painful, the doctor advised electrical treatment to which she consented.

On the occasion of the first treatment the doctor placed her upon his treatment table and proceeded to give her electric therapy, utilizing the Wappler machine. The application was made by means of a lead foil cuff around the shin and a lead foil electrode placed at the sacroiliac region. He followed this treatment with exposure to a Kny-Scheerer 500-watt therapy lamp at a distance of twenty inches, and a one minute exposure to a Hanovia air-cooled quartz vapor lamp at a distance of twenty inches. This identical treatment was repeated on several different occasions uneventfully, until one occasion when the current of the Wappler machine had been turned on for fifteen minutes, the patient suddenly called to the nurse in attendance, who found her to be sitting up; and that she had pulled her leg away and had caused the wire to be disconnected from the lead foil cuff, and that the metal clamp which held the wire to the cuff rested on the patient's leg and sparks were emitting therefrom. The current was immediately turned off and the doctor found that the patient had received a burn on the shin. A boric acid salve was applied to the burn and it was covered with a gauze bandage.

The following day the doctor called at the home of the patient and further treated the burn, and instructed the patient how to care for the burn herself as it seemed in no way dangerous. The doctor heard nothing further until a suit was instituted by the patient, charging that the defendant was negligent in his treatment of the patient; in the use of his electrical apparatus; and in his failure to give the necessary and proper attention after the burn had been sustained.

The action was duly brought on for trial before a judge and jury. The plaintiff's testimony was to the effect that her damages were pain and suffering for upwards of ten months. The evidence on behalf of the defendant showed that the burn was received solely because of her failure to follow instructions and shifting her position on the treatment table during the application of the diathermy treatment. The jury returned a verdict for the defendant, thereby terminating the case in the doctor's favor.

#### CLAIMED NEGLIGENT OPERATION ON EYELID

In this case the defendant, a physician and surgeon, who specializes in plastic eye work, was consulted by the plaintiff who complained of a scar over the right eye.

The doctor made an examination and found a bad scar in the center of the right upper eyelid which caused the eyelashes to turn inward. The doctor recommended an operation which he explained to the patient necessitated three separate stages. To this the patient consented and was admitted to an eye and ear hospital. For the first stage of the corrective operation the doctor made a cautery puncture over the eyelid, using a novocaine anæsthetic. The patient was given post-operative treatment at the doctor's office five or six times, at which times dry dressings were applied to the affected parts.

At the time scheduled for the second stage of the operation the patient was made ready for the operation, and just as the doctor was about to proceed the patient suddenly decided not to have the operation performed, giving no explanation for his actions. It was the doctor's intention to bring the margins of the cautery punctures together at this second operation.

An action was instituted against the doctor

by the plaintiff charging him with negligence in his treatment of the case and alleging permanent disfigurement and impairment of eyesight. The case was duly brought on for trial before a judge and jury. At the trial it was apparent that the patient's personal appearance was very grotesque, as a considerable portion of his eyelid was missing. He testified that during the performance of a cautery puncture operation on his eyelid the defendant had burned off a portion of the eyelid directly over the cornea. The defendant's contention was that the part of the eyelid that was missing was not burned off by him, but that it had sloughed off due to causes over which he had no control, and particularly was due to the patient's refusal to undergo the second operation. The plaintiff explained his sudden departure from the operating table by stating that he had decided not to go through with the treatment as he at that instant had determined that the doctor had committed malpractice in the first operation.

The Jury found a verdict in favor of the defendant. Plaintiff's attorney attempted to persuade the judge to set aside the verdict and grant a new trial, but this motion was denied, thereby terminating the matter in the doctor's favor.

#### ALLEGED NEGLIGENCE IN TONSIL OPERATION

In this case the plaintiff called at the office of the defendant doctor and complained of pains in the back of his head and also in his ankle and knee-joints, giving a history of chronic rheumatism. He stated to the doctor at that time that he had been treated by other physicians who advised the removal of his tonsils, claiming that such an operation probably would improve his rheumatic condition.

The doctor made a careful examination of the plaintiff and found his tonsils to be in a very badly infected condition and advised their removal. With the patient's consent the doctor removed the tonsils, giving the patient post-operative care for six weeks until his throat was completely healed and then discharging him from his care in very good condition. The patient being a man of very limited means, the doctor made only a nominal charge for his services.

Some time later the patient's daughter communicated with the doctor and claimed that he had promised that the operation would result in a cure of the rheumatic condition, and insisted that as the patient still was troubled with rheumatism the fee should be returned. She also claimed that her father had consulted another physician who had stated to him that the tonsil operation was not successful as some parts of the tonsils still remained in his throat. The doctor, of course, had made no representation such as the daughter claimed, and refused to refund the fee.

The next the doctor heard about this matter was when a suit was instituted against him in which the plaintiff claimed that the negligent manner in which the operation had been performed had caused him to sustain severe and painful injuries and demanded a large sum for damages. The case was noticed for trial and appeared upon the calendar from time to time, but before the action was reached it was marked off at the plaintiff's instance and no steps were ever taken on behalf of the plaintiff to restore said case to the calendar.

Subsequently, the defendant moved to dismiss the complaint for lack of prosecution, which motion was granted, thus terminating the case in the doctor's favor without trial.

#### NEWS NOTES

#### FOURTH DISTRICT BRANCH

The twenty-fourth annual meeting of the Fourth District Branch of the Medical Society of the State of New York, was held at Saranac Lake in the Black Memorial Room of the Trudeau Laboratory, the afternoon of October 16th, 1930, Dr. William L. Munson of Granville being the Chairman.

Dr. Frank vander Bogert of Schenectady gave the vice-president's address "An Apprisal of our Present Methods of Raising Children." This was an unusually able effort with caustic comments concerning fads and faddists and those who have wild programs for the bringing up of children,

Dr. Edward S. Godfrey, Jr., of Albany, told of the diphtheria situation in New York State, and stated that while substantial progress had been made toward the eradication of diphtheria, it was essential to continue the administration of toxin-antitoxin to every child under ten years of

"Relief of Abdominal Pain by Section of Sympathetic Rami Communicantes" was the subject of a scientific paper by Dr. Lyman Barton, Jr., of Plattsburg. This paper was illustrated with drawings by the father of the author, and was a report of the first cases that have been done in this section of the country.

Dr. R. E. Plunkett, Director of the Division of Tuberculosis of the State Department of Health, gave a talk on "Public Health as related to the Practice of Medicine." He made an eloquent plea for the doctor to report tuberculosis

cases.

The outstanding item on the whole program was an address by the Honorable William M. Bronk, the Welfare Commissioner of Washington County, on "Welfare Work and the Practice of Medicine." Mr. Bronk evidently understands the practice of medicine. He stated:

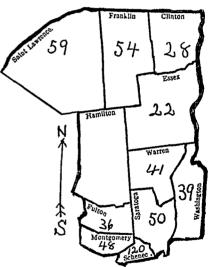

1. That doctors should be paid for their work as are the grocer and coal man.

2. That he willingly approves all emergency calls.

- That after the emergency call he does not pay the doctor unless the authority comes from him.
- 4. That he would consider a public health nurse, or a welfare worker, who called a doctor sufficient authority for the first call; and that the necessity for those following would be investigated.
- That he would not authorize the sending of cases away from the local hospital unless it were absolutely necessary for medical reasons; and that

he believed that the local hospitals were capable of doing the work. This was aptly illustrated by a case of a fractured hip. He stated that he was a layman and conducting the welfare work on a business basis, and that, in things pertaining to the medical side of the cases, he accepts the decisions of the doctors and never questions them from a medical standpoint.

6. That he thinks it is a waste to spend much money on advanced cases of tuberculosis, and that it should be done out of humanitarian motives, and for the purpose of protecting the other

Counties of the Fourth District. The figures indicate the number of members of the County Medical Society.

members of the family. He believes that the money should be spent upon those who are in the early stages of the disease, and who could be taught how to take care of themselves and brought back to useful lives.

- 7. That he believes the patients should select their own doctors; that he does not favor part time "poor doctors"; and that he would not let his deputies make the choice of doctors.
- 8. That his mind was entirely flexible in the matter of administrative details, and he reserved

the right to make any changes at any time when

the facts warranted a change.

The Commissioner's speech was discussed by practically every one present at the meeting; in fact, it was in the nature of an inquiry led by the doctors as to Mr. Bronk's opinions.

At the banquet held at the Saranac Lake Hotel, which was attended by the doctors and their women-folk, Dr. Edward S. Welles presided.

Dr. William L. Munson, President of the Fourth District Branch, gave an address on "The Archives." He read extracts from a book in which he has recorded incidents in his years of practice. He illustrated the good fortune of a doctor to have a well developed and well controlled sense of humor, that is, the good fortune of the doctor whose sense of humor is a saving grace in times of stress and worry.

Dr. William H. Ross, President of the Medical Society of the State of New York, made a very serious and excellent address concerning the "Interrelation Public Health and the Family

Physician."

Dr. John A. Card, Speaker of the House of Delegates, spoke on "Malpractice Group Insurance," demonstrating that the State Society supplies the best and cheapest of all forms of indemnity insurance.

Dr. Augustus J. Hambrook, of Troy, spoke upon the subject of interesting the wives of the doctors in doing public health work. He advised the ladies to join local organizations and take an active part in their work so that they might

be able to give aid to the various committees upon which they served.

Dr. James E. Sadlier gave an address on "Public Relations." He said that he occasionally became tired, but a trip to the Fourth District Branch meeting "revives me immediately."

The Friday morning session was a "Symposium of Tuberculosis." This was most interesting and instructive, being a complete résumé of the surgery of tuberculosis. The introduction was given by Dr. Edward R. Baldwin of Saranac Lake; and was followed by Dr. Lawrason Brown, who spoke on the "Principles of Rest in the Treatment of Tuberculosis." The "Indications and Selection of Cases" was the subject of a talk by Dr. Edward N. Packard. Dr. Frederick H. C. Heise spoke on "The Use of Artificial Pneumo-thorax in the Sanatorium." Dr. John N. Hayes demonstrated the use of pneumothorax with a patient. was very well done and well received by the doc-Dr. Sidney Blanchet spoke of the later results of the operation.

Dr. Edward S. Welles, President of the Franklin County Medical Society, who had arranged the Symposium group, gave "Surgical Procedures" with lantern slides and demonstration

of patients.

Dr. Frank vander Bogert of Schenectady was elected president for the ensuing two years.

The universal opinion was that the meeting was quite unusual and interesting.

WILLIAM L. MUNSON, President.

#### PUBLIC RELATIONS COUNTY SURVEY, NO. 16-BROOME COUNTY

The following address, given at the conference of Chairmen of the Public Relations Committee of the county medical societies on September 18, 1930, in Albany, is an excellent description of what a county public relations committee may accomplish in the way of leadership of public health movements which are often left to the initiative of lay health organizations. While the address does not list the twenty-nine lay bodies engaged in public health work in Broome County, it does tell what the organizations did; and it therefore is worthy to be classed as a public relations survey of Broome county.—(The editors).

Two years ago, through ignorance, I would not have felt that I was competent to enter a discussion of the duties of the Public Relations Committee. Due to the missionary efforts of Dr. Ross and Dr. Sadlier throughout the state, we are coming to understand the ideals and functions of this committee. Broome County is not moving very rapidly along these lines because of a certain amount of conservatism among the members of the society with regard to new movements. We decided that we would continue a movement started a year ago along public health lines and confine our activities to a toxin-antitoxin campaign.

At about the time that the Broome County

Medical Society was ready to begin the campaign, word was brought to us that one of our powerful lay organizations had a representative in the field working with private organizations for a T-A Campaign. We sent word to this representative to come in and have a talk with us. She informed us that she was sent here by The State Charities Aid Association to promote a T-A Campaign in Broome County; but we informed her that the Medical Society was about to start a T-A campaign. Fortunately for us, this was the first attempt of this representative along T-A lines and she was open for any and all suggestions; but being sent here to remain an indefinite time and do a definite work, it was

necessary to find a type of work she could do prior to the starting of the campaign. She was told the matter had not been brought to the physician's attention as yet and she was given a list of the doctors and asked to call upon each personally and explain the campaign. She accomplished this in a satisfactory manner, so that when the County Society met, there was very little discussion and the movement was voted unanimously.

When the request for a survey was received, we looked around and said "What will we survey?" We are a county with a large industrial corporation which employs 26 full time physicians and about the same number of nurses. Four other industrial organizations that employ from one to three physicians on part time in looking after the general health of their employees, the insurance companies, and the Red Cross seemed to constitute the main factors working in the field of public health.

After starting the T-A Campaign, it soon became evident that the work could not be done

satisfactorily without outside help to do the organizing and clerical work. The Local Manager of the Metropolitan Life Insurance Company kindly consented to be the chairman of the organization and publicity committee and the representative of the State Charities Aid took charge of clerical work and spent much time visiting and speaking before various lay organizations. In a short time there were 29 different lay bodies all united under the direction of this committee and working harmoniously for one end.

We centered our activities on the preschool child with the result that we raised our percentage of all children immunized in this group from 23 to 45 per cent. The committee feels that too much cannot be said in appreciation of the efforts of these various organizations; and special thanks are due the Metropolitan Life Insurance Company and The State Charities Aid Association for their assistance.

C. J. Longstreet, Chairman, Public Relations Committee.

#### THE UTICA COUNCIL OF SOCIAL AGENCIES

The welfare agencies of the City of Utica have evolved a practical system of mutual helpfulness and coordination which is described in the following communication from Dr. T. H. Farrell, Chairman of the Public Relations Committee of the Medical Society of the County of Oneida.—(Editor's note).

"Here in Utica we have a Council of Social Agencies comprising all the organizations, lay and professional, that are doing any form of welfare work. There are in all 50 or 60 agencies comprised in the council. In the two or three years of its existence, it has held monthly dinner meetings, after which the representatives listened to one or more speakers on various phases of welfare work.

This year the executive committee decided that it was time to take a step further and to divide the agencies into three "Study Groups," which will meet independently for a more intensive study of their immediate problems. These groups are 1st, Housing; 2nd, Child Welfare, and 3rd, Health. In the health group we have the representatives of the City Board of Health, Camp Healthmore (T.B.), the four general Hospitals, State Hospital, Hospital for Crippled Children, Tuberculosis Council (State Charities Aid), Dental Dispensary, Utica Dispensary, Visiting Nurses Association, County Medical Society, Utica Dental Society, and the Academy of Medicine. I have been assigned to the chairmanship of this

health group, with instructions to make a survey of the health situation of the City of Utica, and recommendations for increased cooperation and supervision. Of course we are free to discuss any problem that is presented to the group.

"Last winter in cooperation with the Y. M. C. A., the County Medical Society and the Utica Dental Society put on a series of health talks in a number of the large mills during the noon hour. These were so well received by the workers in the mills, as well as by their executives, that we were requested to give another series this year. Ten of the large mills have signed up already, and a number of them are so impressed with the value of these talks to their employees that they close down before noon so as to enable all the employees to take advantage of them. The topics planned for this year are as follows: Injuries and Infections, Communicable Diseases, Care of Eyes, Care of Teeth, Periodic Health Examinations, Common Cold. The Medical and Dental Societies provide the speakers, and the Industrial Secretary of the Y. M. C. A. attends to all the details."

#### COMMITTEE ON ECONOMICS

The Committee on Economics of the Medical Society of the State of New York met on Wednesday, October 15, in the rooms of the National Bureau of Casualty and Surety Underwriters at 1 Park Avenue, New York City, and held a conference with representatives of the insurance companies engaged in workmen's compensation insurance and the Economic Committees of the five county medical societies of Greater New York. The conferees reached a unanimous agreement regarding the major points of difference

between the physicians and the insurance companies, and formulated a set of principles to be submitted to the Insurance Companies and the County Medical Societies for the approval of the members of both groups. The unanimity of opinion and cordiality among the conferees is a strong indication that the principles will be approved by the members of both groups.

A communication, constituting Bulletin Number 4, has been sent to every County Medical

Society in New York State.

#### Bulletin No. IV.

To the Secretary of......County Medical Society.

1. Will you kindly, at the November meeting of your Society, or at a special meeting, bring the matter of the enclosed agreement between your Medical Society and the Compensation Carriers up for action through the Economic Committee of your County Society?

2. It is necessary that such agreement be com-

pleted within the month of November.

- 3. It is the earnest desire of the State Committee on Medical Economics that favorable action be taken upon this agreement between each County Medical Society and the Compensation Carriers.
- 4. We expect that this agreement will be very quickly consummated between the five counties comprising the Metropolitan District and the 80 or 90 Insurance Carriers, and this means that about 10,000 physicians in the State are favorably inclined. The State Committee on Economics wishing all of the Counties to have the benefit of this agreement, are forwarding copies to each County Society so that the remaining four or five thousand physicians may be benefited.

5. Practically all of the Insurance Carriers will

be in agreement, and this will mean that any case can be treated by any reputable member of the State Medical Society without authorization by the Insurance Carrier; and that a board of arbitration consisting of two members from the Insurance Carriers and two physicians who are members of the County Society properly designated shall be the last word in adjustment of bills and other matters.

Should this agreement be mutually accepted, it will accomplish what has been in the minds of physicians for many years. It is a gentlemen's agreement, and can be given a trial; and later on, if there are some things to be taken up, such as the matter of proper fees, they can be easily adjusted. It is to be noted that it will not be necessary to have any legislation, and we of the State Economic Committee have been given assurance that it is looked upon with favor by the Industrial Commissioner and the representatives of organized labor.

Again may we request that this be acted upon immediately and that the agreement be signed and forwarded to the Chairman of the Committee on Medical Economics

on Medical Economics.

George F. Chandler, Chairman.

Statement of Principles and Agreements Between the Medical Society of ....... County and the Compensation Carriers, Comprising the Stock Companies, Mutual Companies, State Fund and Self-Assured

#### Statement of Aims

The aims of the County Medical Society are:
To secure for its members the acquiescence of
pensation claimants by those physicians who fall
within the definition as hereinafter more fully
set forth, without formal authorization from employers.

The aims of the Carriers are:

1. To receive the cooperation of the County Medical Society and its members in the interests of a proper administration of the Workmen's Compensation Law from the standpoint of the employee, to wit: That the employee receive skillful medical and surgical care; that the necessary forms be promptly completed so that the carriers will be able to promptly pay compensation, and that the necessary forms be quickly filed, in the desire of securing reasonable and prompt bills for services rendered to employees by the medical profession; and that the bills and forms be forwarded to the companies and not to the Compensation Commission as has been done in the past by some physicians who have been uninformed.

2. To express in words the present practice

of reputable carriers and remove from the minds of the medical profession the existing erroneous opinion that the carriers indiscriminately and captiously lift cases of injured employees from the care of competent and qualified family physicians of those employees.

Thus, in correspondence with the preamble, the

following agreements are entered into:

#### The County Medical Society

1. The County Medical Society will use every reasonable effort to impress upon its members the importance of careful and skillful treatment of industrial injury and occupational disease cases, and bring home to its members the thought that the chief principle in treating these cases is that the injured employee be brought back as quickly and fully as possible to as near an efficient and economic person as is possible.

In line with this the County Medical Society will urge upon its members that if cases reach them in which the physician is not entirely sure that he is, by training and experience, capable of handling, the doctor will immediately communi-

cate with the carrier for advice.

2. The County Medical Society further agrees that it will impress upon its members, and secure from its members, an agreement to complete the necessary paper work, or forms, such as C-4 or C-5 and other forms, within one week in each case, and that these forms will be promptly sent to the carriers; that on these forms will be furnished such information as the physician has at the time of completing the form, and that the physician will furnish such other reasonable supplementary information as requested; and, finally, will submit promptly an itemized, self-explanatory bill for services rendered.

3. The County Medical Society of...... will evolve from time to time fee schedules, and submit them to the carriers for approval, for service rendered to injured employees, and will call upon its members to conform to such fee schedules, it being clearly understood that this fee schedule shall be a guide to the treating physician in the preparation of his bill for services.

 The Medical Society of the County of . . . . ......further agrees that it will participate in the creation of a joint committee of physicians and carriers, to act as an Arbitration Board, for the settlement of disputed bills between physicians and carriers. This Committee shall consist of two members of the County Medical Society and two representatives of the carriers. No arbitrator shall sit in any case in which he or the party he represents is interested. Any physician submitting to arbitration shall abide by the decision of the Board.

The County Medical Society will expect its members to present all cases of disputed bills to the Arbitration Board as above stated for prompt action.

5. The members of the County Medical Society agree to seek the advice and abide by the decision of the carriers as respects consultations, x-rays, physical therapy and other treatments beyond ordinary treatments; and, further, the physicians will cooperate with representatives of the carriers in securing for the carriers examinations of claimants at reasonable times.

Although the members of the County Medical Society shall generally adhere to the above stated principle, still in such emergency cases wherein the opinion of the attending physician, the welfare of the patient demands, and the protection of the physician requires an immediate consultation or x-ray, it is understood that the physician shall proceed properly, and the question of the necessity of such action and the reasonableness of the charges incurred, if disputed, shall be passed upon by the Arbitration Board.

- 6. The County Medical Society agrees to provide meetings at which such physicians as are specialists in industrial medicine and surgery may appear to discuss improved phases of this work; and will further provide meetings at which persons familiar with the operation of the Workmen's Compensation Law may appear and inform the members of the Society in respect to the detail matters necessary to the proper carrying out of the compensation laws.
- 7. The County Medical Society agrees to develop and establish standards both of equipment and training for physical therapy and x-ray. After such standards have been arrived at, the County Medical Society will expect its members to comply therewith.

#### The Carriers

 The carriers agree that when they participate in the Arbitration plan, as set forth above, and present disputed bills for services between the carriers and physicians who are members of the County Medical Society, they will abide by the decisions of the Board.

Carriers agree to participate with the County Medical Society in setting up and adhering to

the fee schedule.

The carriers agree to waive the question of authorization for family physicians who are members of the County Medical Society and who will comply fully with the agreed plan of the County Medical Society and the carriers. Reasonable charges for services of such physicians will be promptly paid.

4. The carriers agree to furnish literature, as may be available and take other measures to aid in instructing the members of the County Medical Society in relation to the industrial medical and surgical fields, and also with regard to the detail and paper work which is so important a feature in the interest of the efficient administration of the Workmen's Compensation laws.

#### ONTARIO COUNTY

The annual meeting of the Ontario County Medical Society was held at Wenna Kenna, East Lake Road, Canandaigua Lake, with the President, Dr. C. W. Webb, of Clifton Springs in the chair. Fifty-seven out of the seventy-six members of the society were present as follows: Drs. Munford, Odell, Wedd, Thomas, Williamson, Wright, Mead, A. D. Allen, Webb, Lichty, Sanders, C. H. Jewett, Cook, Padgham, Nieder, Skinner, DeLancy, Hubbs, Morabito, Selover, Armstrong, Cole, Robinson, Schoonmaker, Johnston, J. S. Allen, Stebbins, Mason, Gregg, Stetson, Clapper, Blakeslee, Howard, McDowell, Rhudy, Barringer, Conley, Maloney, Howe, Quigley, Beahan, Lytle, Stewart, J. H. Jewett, Spengler, Eiseline, Touhey, Haslett, Gardner, Pratt, McClellan, Ward, Burgess, Sargent, Gasper, Grove, and Deuel.

Guests present: Dr. William H. Ross, Brentwood, N. Y.; Dr. Allen Freeman, Baltimore, Md.; Dr. J. S. Lawrence, Albany, N. Y.; Dr. B. R. Wakeman, Hornell, N. Y.; Dr. Lloyd Allen, Pittsford, N. Y.

The following officers were elected for the year 1931:

President, B. T. McDowell, M.D.; Vice-President, T. W. Maloney, M.D.; Secretary and Treasurer, D. A. Eiseline; Board of Censors, H. Schoonmaker, M.D., F. C. McClellan, M.D., J. S. Allen, M.D.; Delegate to State Society, C. C. Lytle, M.D.; Alternate Delegate, C. W. Selover, M.D.; Delegate to Seventh District Branch, J. D. Shipman, M.D.; Alternate Delegate, A. M. Stewart, M.D.; Chairman Public Health Committee, W. B. Clapper, M.D.; Chairman Legislative Committee, H. J. Knickerbocker, M.D.; Committee on Medical Economics, H. J. Knickerbocker, M.D., C. H. Jewett, M.D., A. W. Armstrong, M.D.

Dr. R. Graham Johnston, of Geneva, was elected to membership.

The Society voted to support the State Bond issue of \$50,000,000 for the construction of hospitals and correctional institutions.

A report of the Committee appointed to investigate the status of the County Welfare Work and the fees paid physicians and hospitals, was read by Dr. C. H. Jewett.

Dr. Allen W. Freeman, Prof. of Public Health Administration, Johns Hopkins School of Hygiene, gave an epitome of the report he expects to make of his survey of the Public Health activities in Ontario County.

After a social dinner the meeting took the form of an appreciation of the attainment of fifty years of membership in the Ontario County Society by Dr. Alfred M. Mead of Victor and Dr. Alexander D. Allen of Geneva. When the two doctors were elected members in 1880, the secretary of the society was Dr. J. H. Jewett, whom the society honored on October 8th last year with

a testimonial banquet on the occasion of the completion of his fiftieth year as a member of the county society. (See this Journal, November 15, 1929, page 1412). Dr. Jewett read from the minutes of the meeting of April 13, 1880, when Dr. Mead was elected a member, and from those of July 13, 1880, when Dr. Allen was admitted. Some of the extracts from the minutes of the meeting of April 13, 1880, will be of great interest to the present members of the Medical Society of the State of New York.

The first extract related to a case of supposed rabies, and read as follows:

"Dr. Van Vleet reported what he believed without doubt to be a case of hydrophobia occurring in a young man under his care which resulted in recovery. The man was bitten in the finger by a dog which at the time was supposed to be perfectly well, but on the next day it is said showed plain symptoms of hydrophobia and shortly died of that disease. The first symptoms developed in the man ten days after the accident and consisted in a choking sensation on attempting The first convulsion took place two to drink. weeks from the time that the bite was received and followed with a brief interval the drinking of four glasses of cider. The convulsions occurred repeatedly for a period of six days and then stopped and there has been no return of them since, more than a year having elapsed. The treatment consisted in the hypodermic injection of 11/4 grains of sulphate of morphia combined with a 1/60th of a grain of sulphate of strychnia. This was repeated with benefit several times and then the morphine was increased to  $1\frac{1}{2}$ grains by actual weight. Bromide of potassium was given in the intervals. The convulsions continuing to take place the morphine was discontinued and the hydrate of chloral was given in 45 grain doses with quinine several times a day in from 5 to 8 grain doses. The convulsions finally ceased to occur under this treatment and the only unpleasant symptom remaining was a feeling of fullness in the head upon stooping which yielded to the use of strychnia. This narration was followed by a discussion upon the subject of hydrophobia and several members reported cases that had come under their observation. Particular inquiries were made of Dr. Van Vleet as to the exact amount of morphine injected and the question was raised how much morphine is safe to give hypodermically in ordinary cases."

The second extract was on a subject that still has very modern appeal, and was as follows:

"Dr. Lewis then read a paper upon 'The Relationship of physicians to the outside community."

It would have been interesting if that relationship had been defined, but the members were more interested in a new diagnostic instrument which was discussed as follows:

"Reference being made in the paper to the use of modern instruments of precision in the diagnosis of disease, remarks were made by different members upon the use of the clinical thermome-Doctors Bennett, Hicks and Wilbur expressed themselves greatly in favor of its use Dr Smith regarded the claims of many for its usefulness as exaggerated and regarded it as of only limited use"

Doctors Mead and Allen recounted some of their experiences of their half century of mem

bership in the County Society Each doctor wa presented with a book as a memento of th meeting

Dr W H Ross, President of the Medical So ciety of the State of New York gave an addres upon the same subject as that discussed in the meeting of fifty years ago, and showed how the societies of the State and Counties are developing plans for bringing all forms of medical service to all persons in a community

D A EISELINE, Sicretary

#### TIOGA COUNTY HEALTH DEMONSTRATION

The Tioga County Medical Society was the leading organization in a Health Demonstration at the Tioga County Fair last August Those cooperating were-The Tioga County Medical Society, The Tioga County Public Health Committee, The Tioga County General Hospital, The State Charities Aid Association, and the State Department of Health

The program was published in the form of

a four page folder which said -

"The Board of Supervisors of Tioga County appropriate annually \$3,000, which is raised by direct taxation, and the State of New York ap propriates an equal amount

"This fund is disbursed under the direction of an authorized group named by the Board of Supervisors, and designated The Public Health Committee of Tioga County The members of

the present committee are --

Supervisor, B C Rawley, Chairman Miss Agnes Oldfield, Owego, Secretary Mrs Seward Baldwin, Waverly Miss Anna W Abel, Owego Dr G S Carpenter, Waverly Dr W A Moulton, Candor Dr Eugene Bauer, Owego Supervisor H W Foote, Candor."

One page of the folder read

Health Demonstration Program, Tioga County Fair, August 19, 20, 21, 22

The Greatest Asset of Tiago County is the health of her people"

The two inside pages of the folder were on the subject of a health inventory, especially the regular examination of children

The Secretary of the Tioga County Medical Society, Dr W A Moulton, in a letter dated October 28th, described the exhibit as follows

This project was very well received by the ple of Tioga County There were two tents, people of Tioga County one large and one small The large one was used for the meetings and general rest rooms. Health movies provided and operated by the State Dc partment of Health were shown almost constantly A cot, and equipped emergency table, stood behind a screen near the entrance and was used for ten emergencies A frigidaire loaned by a local merchant was used for pasteurized milk, which was donated by a local dairy company, and one hundred and twenty-five bottles were given to children At the entrance to the tent free literature, published by the State Department of Health, was displayed, and fifty-three cards were signed requesting 163 pieces of literature Total attendance at meetings 190 People were very much interested. At all other times, to see movies, etc., attendance 802

"A wire fence minde a playground for preschool children, and the small tent located in one corner was used by thurty-six nursing mothers, and twenty-five babies were left there in care of nurses This tent was equipped with cots and comfortable chairs

"The two county nurses and a student nurse formed by a nearby hospital were on duty duly

and a night watchin in was on duty at night "

mercial or technical schools. Twenty-one of the girls who had intended to become teachers decided to go into other callings. The others, though they made a mess of their studies at school, still planned to go to college and, in time, to become

lawyers, physicians or engineers.

"Discussing his findings in *High Points*, the official publication of the Board of Education, Mr. Stockton indicates the waste and hopelessness involved in the aspirations of these youngsters. It costs the Board of Education \$125 a year to

keep them at school, but more important is the loss in morale they themselves are bound to sustain. 'Will these students waste time and money trying to attain a height they cannot reach and become too old and too proud to enter the ranks of skilled and unskilled labor?' asks Mr. Stockton. It is a question to be considered by parents who, closing their eyes to the poor scholarship reports their children bring home from school, encourage them to continue a hopeless quest of the unattainable."

#### CAUSE OF DENTAL DECAY

The New York *Herald-Tribune* of October 26, makes the following announcement, quoting Dr. Charles F. Bodecker, Professor of Dentistry of Columbia University:

"A grant of \$101,100 over a period of three years has been made by the commonwealth fund to promote research into the cause of dental decay, the cure of which is declared to be second in importance only to the cure and prevention of cancer. The research will include investigations in the fields of clinical medicine, dietetics, bacteriology and physiological chemistry.

"The belief that 'clean teeth do not decay' contains little truth, Dr. Bodecker contends, for conditions within the teeth, rather than outside hygienic measures, determine the soundness of the tooth structure. In support of this theory, he points out that many persons who pay no attention to the care of their teeth have good

teeth, while others whose prophylactic efforts are unceasing are unable to retard decay. Teeth from which the nerves have been removed appear to disintegrate more rapidly.

"To prevent decay, some means must be found of neutralizing the acid formed on the surface of the teeth by the fermentation of food debris before the acid attacks the enamel. The hope of success lies in achieving that neutralization from the interior of the tooth. Since the toothbrush cannot clean the many inaccessible areas of the teeth, and since alkaline dentifrices are soon washed away by the saliva, the supposed beneficial effects of such measures are minimal, he asserts."

The reporter calls this a new theory, and so it probably was to him. The novelty of the news consists in the report of a large grant of money for the study of the decay of teeth.

#### DINOSAUR MORTALITY

What killed the dinosaurs that roamed North America three score millions of years ago? The New York Sun of October 23 attempts to answer the question editorially when it said:

"One opinion is that the dinosaur succumbed to the superior intelligence of some smaller mammal which eliminated its larger contemporary by consuming its eggs. If that is so any Westerner can identify that smaller mammal—it was undoubtedly a direct ancestor of the coyote, a creature which will eat anything it can get its teeth into

"Against this opinion, however, Charles W. Gilmour, curator of the division of mammals of the Smithsonian Institution, raises an important objection. 'If the destruction of the eggs of these mammals by other mammals caused their extinction,' he asks, 'why are not birds made extinct by the raids of snakes on their eggs?' His own theory is that climatic changes and resul-

tant loss of necessary environmental conditions, extending over millions of years, may be held responsible for the dinosaur's permanent departure from the American scene.

"This theory is based on belief that North America in dinosaur days was a vast swamp; that as the continent was formed and mountain systems were raised to create the Mississippi basin the waters began to drain off. The dinosaur was essentially a swamp dweller; when the swamps shrank he could do no better than to disappear.

"Somehow this theory seems in better keeping with American tradition than the theory of mammalian egg-suckers. Every true American must believe that our own dinosaurs were the biggest, fiercest and most bellicose of their species. If it were necessary to heave the Rocky Mountains at them to drive them off, so much the better for the theory."

#### HEALTH EXHIBIT AT THE NEBRASKA STATE FAIR

The October issue of *The Nebraska State Medical Journal* has the following editorial description of the health exhibit conducted by the Nebraska State Medical Association at the State Fair:

"A large two-story building with two outlying wings and an annex are devoted to the exhibit. The State Fair Board foresaw the importance and possibilities of this work several years ago and set apart these buildings for the purpose of an annual health exhibit to be put on under the direction of the Nebraska State Medical Association.

"The several divisions of the work are carried on under the following heads: Tuberculosis exhibit; illustrated lectures; separate departments for health examinations of adults, children and infants; the passing out of literature, and in addition, the emergency hospital and nursery are under the supervision of this department. The Women's Auxiliary has a desk featuring the magazine Hygeia.

"The tuberculosis exhibit is made by the Nebraska Tuberculosis Association cooperating with the public activities committee of the Nebraska State Medical Association and consists of morbid specimens, charts, illustrative of tuberculous conditions, etc. Persons wishing it are weighed, and if underweight points to possible disease, they are referred to the health examination department.

"Several registration desks line up the several classes of persons to be examined and direct the

order of examination. About two dozen booths are devoted to the examinations, each equipped with a palette covered table and other needed accessories. About a hundred physicians from over the state take part in the examinations, each scheduled for a particular period. A surprising number of unsuspected physical defects are discovered. When defects are discovered the person is referred to his family physician for attention.

"A theatre accommodating several hundred persons is provided. Here lectures and moving pictures pertaining to health are given continuously

during the day.

"Literature is passed out. Two leaflets were particularly featured this year: "Prenatal Care" and "Do We Keep Faith With Our Children?" At the Emergency Hospital, as its name implies, all emergency cases applying are cared for. The Nursery cares for babies, free of charge for 2-hour periods and relieves the mothers for that period. That this is appreciated is attested by the fact that in one day the nursery cared for 46 babies. Twenty cribs are provided, the large room is kept quiet and with subdued light and the babes are under the supervision of trained nurses.

"It has become apparent that if this work is to be continued and further developed some way must be devised to provide means to employ a full-time head. No man can give the best there is in him to the public good to the neglect of his own business without full compensation."

#### WORKMEN'S COMPENSATION IN OREGON AND WASHINGTON

The October issue of Northwest Medicine, the organ of the State Medical Associations of Oregon, Washington and Idaho, has the following editorial dealing with the free choice of a physician, and contract practice which shows that the Pacific States have conditions even worse than those in New York:

"No subject has elicited so much discussion and controversy of late among the profession of Washington and Oregon as has that of contract practices. There is little criticism of the fees paid by these departments, the compensations being considered fair, all conditions considered. The rub is that these fees are not equally obtainable among the profession, nor do those performing the services always receive the full compensation which is provided for this work. The contract

abuse appears chiefly under two forms. Certain groups of physicians, ordinarily designated as clinics, have succeeded in corralling the practice among leading industries and manufacturing concerns to the exclusion of the individual practitioner, often bridging large sections of the State with branches in numerous towns and cities. The most objectionable phase, however, is found in the hospital associations, commonly controlled and operated by laymen, and often emanating from alien states, which have succeeded in capturing many industrial contracts, doling out the actual treatment of patients to certain physicians who receive for their services only a percentage of the fees paid out by the State, the balance going to the promoters of the associations. The problem is further complicated by the statement (Continued on page 1392—Adv. xii)

# Announcing

#### the new potency of

The recent wide-spread clinical use of Viosterol preparations in the prevention of rickets has stimulated investigators to determine whether they are as effective in the prevention and treatment of rachitic tendencies as cod-liver oil. Leading workers in the field of rachitic research, from observation of hundreds of child subjects, have finally come to the conclusion that the present Viosterol preparations, namely, Viosterol-100 D, and Cod-Liver Oil with Viosterol-5 D, are of insufficient potency to guarantee sure results. These authorities in the medical profession, together with the Wisconsin Alumni Research Foundation and the Council on Pharmacy and Chemistry, have, therefore, agreed to increase the strength of all Viosterol preparations that are prepared under license from the Foundation.

These scientific studies indicate that the amount of Viosterol should be increased 2½ to 3 times Therefore, since October 1, 1930, Viosterol in Oil-100 D has become Viosterol in Oil-250 D. Cod-Liver Oil with Viosterol-5 D, has become Cod-Liver Oil with Viosterol-10 D. Viosterol preparations of lesser potency, now on the market, will no longer be available.

# Advantages of Squibb Viosterol in Oil-250 D

- Highly Concentrated—Odorless and tasteless; no danger of digestive disturbances following its use.
- 2. Definite Dosage—Physiologically standardized to the definite unit count of Vitamin D.
- Drop Dosage—Dropper supplied with each vial is calibrated to deliver 75 units of Vitamin D per drop.
- Specific Action—Exerts unquestioned specific action in cases of rickets, rachitic tetany, osteomalacia and other calcium-phosphorus metabolic disorders.

Squibb Viosterol in Oil-250 D, and Squibb Cod-Liver Oil with Viosterol-10 D and Squibb Cod-Liver Oil are accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

# RED CROSS FIRST AID TO MOTORISTS IN FLORIDA

The September issue of the Journal of the Florida Medical Association contains the following article on emergency first aid stations planned by the American Red Cross.

"Because of the wide public interest in the Red Cross plan to develop a system of highway first aid stations throughout the United States, under local Red Cross Chapters, it is timely to give here a brief outline of that phase of the plan which particularly affects hospitals and the medical profession.

"First, and most important of all, the Red Cross emphatically refrains from encroaching on the respective fields of hospitals or medical men in all its work. The First Aid course, sponsored for many years by the Red Cross, seeks to equip laymen, under competent instruction, to render emergency first aid until the injured can be placed under care of a doctor. In case of serious cuts, fractures, etc., such emergency treatment may frequently be the only means of saving the injured one's life until a doctor can be reached.

"Under the plan discussed here volunteer first aid experts will be stationed at highway first aid posts, to render emergency first aid to injured in automobile accidents, which today lead all other causes of accidental death in the United States.

"At these first aid posts there will be kept at all times a list of the nearest available doctors and approved hospitals and ambulance services. While the services of the Red Cross personnel will be strictly voluntary, and no remuneration will be permitted, the Red Cross cannot underwrite any necessary further treatment from doctors or in hospitals, this being left to the individual.

"In other words, the Red Cross is undertaking a very necessary emergency service to the public. designed to save life and to mitigate suffering, but is confining its assistance to these ends.

The most unpleasant manifestations of malaise have been frequently allayed by drinking

# NEUS DEW-TONE and PORT

has been standardized by experience gained thru a quarter of a century

Tonics have long since passed the age of empiricism. They are now compounded in formulas which conform to the scientific requirements of the individual as interpreted by the physician,

The deficiencies are analyzed and an attempt is made to replace these substances with ingredients as closely similar to the deficient material as it is scientifically possible to determine. For instance; the administration of iron is generally accepted as the specific factor in the treatment of senile anemia and chlorosis. The properly matured Port besides being acceptable to the most sensitive gastro-intes ....al tracts, supplies abundant natural iron of great availability. Dewey's Port is produced from grapes grown in a soil rich in iron. This mineral has thus been synthesized by nature and is readily convertible into human blood forming elements.

To correct faulty metabolism we have compounded in the product sodium, calcium and phosphorous combined in the form of glycerophosphates. This constitutes the most satisfactory, effective method of their administration, supplying nerve nutrition and combating deficiency disorders.

Dew-Tone and Port is sold only direct to you or your patients

H. T. DEWEY & SONS COMPANY Cellaret Egg

138 Fulton Street, New York City

Established 1857

TONSILLITIS and particularly Follicular Tonsillitis is often stubborn and unyielding, with a great tendency to developing into the suppurative form.

# Tonsillitis in all its Forms

When it becomes apparent that suppuration is inevitable, the application of hot poultices is an old and accepted treatment.

Due to its thermogenetic potency and to its bacteriostatic action

# Antiphlogistine

induces an active hyperaemia in the affected area, which dilates and flushes the superficial capillaries, stimulates leucocytosis, and promotes the destruction of the bacteria.

Antiphlogistine has the advantage of being unfermentable and bacteriostatic, and will cling around the contour of the neck, when other applications are difficult to retain in place.

#### LIQUID PEPTONOIDS WITH CREOSOTE

Combines the active and known therapeutic qualities of creosote and guaiacol with the nutritive properties of Liquid Peptonoids and is accordingly a thoroughly dependable product of definite quantities and recognized qualities as shown by the formula:

#### Each tablespoonful represents

Alcohol (By Volume)			12%
Pure Beechwood Creosote	٠.		2 min.
GUAIACOL			1 min.
PROTEINS (Peptones and Propeptones)			5.25%
LACTOSE AND DEXTROSE			11.3%
CANE SUGAR		'	2.5%
MINERAL CONSTITUENTS (Ash) .			0.95%

It acts as a bronchial sedative and expectorant, exhibiting a peculiar ability to relieve Bronchitis—acute or chronic. It checks as well a persistent winter cough and without harsh or untoward effect. It is agreeable to the palate and acceptable to the stomach—with merit as an intestinal antiseptic. Supplied in 12 oz. bottles.

Soak gelatine in cold water and dissolve in boiling water. Add Irmon jusce, all, atrain and chill. When nearly set, stir in chopped spinach, nod and chill until firm. Serve on lettuce hearts or tender chicory leaves and garanth with hard cooked egg, cut lengthwise in sixtle and prinkled with papirlas. Fore with imagonastic

## RECIPES LIKE THESE HELP DIABETIC PATIENTS KEEP THEIR DIETS AND THEIR APPETITES

EVERY physician knows the difficulty of diet control in diabetes—and will appreciate the value of Knox Sparkling Gelatine in dispelling monotony and arousing appetite without disturbing the purpose or the balance of the diet in the slightest degree.

The two recipes on this page show how perfectly Knox Gelatine fits into the diabetic diet. Where small quantities of vegetables, meat or fish are necessary, satisfying bulk may be supplied with Knox Gelatine, which combines perfectly with these essential foods, making them more attractive to the eye and continuously delightful to the taste.

With Knox Gelatine, a different dish may be served every day from the basic foods of the diabetic diet. We would like to send every physician a booklet on "Diet in the Treatment of Diabetes"

WINTER SALAD		(Six Servings)		
Grame	Prot	Fat	Carb.	Cel
teaspoons knox Sparkling Gelatine 4.5	4			
cup cold water				•
' ' ' ' ' ' ' ' ' ' ' ' ' ' ' ' ' ' '	-	***		
250	43	<b>3</b> 4

# greatly increased potency

Manufactured Under License by Wisconsin Alumni Research Foundation

CliNICAL evidence has demonstrated that the 100 D VIOSTEROL is not of sufficient antirachitic potency in many cases. The Wisconsin Alumni Research Foundation therefore has authorized its licensees to market instead an oily solution that is two and one-half times more active.

Consequently, we now supply WINTHROP VIOSTEROL in oil (250 D), which somewhat more closely approximates the product which we first sent to physicians for experimental purposes a number of years before VIOSTEROL was placed on the market in the United States. »

In common with all Winthrop products, the quality of WINTHROP VIOSTEROL is unexcelled. Its manufacture is supervised by highly skilled biologists and chemists. The potency of the finished preparation is assured, for every lot is standardized by rigid biologic tests.

WINTHROP VIOSTEROL 250 D is available in bottles of 5 cc and 50 cc at the same prices as formerly.  $^{\rm w}$ 

Informative booklet sent to physicians on request.

#### . General Rheumatic Conditions

t has been found that a more satisfactory response is obtained in rheumatic conditions when the pure, natural salicylate is administered in conjunction with balanced alkali.

This type of medication is now provided in the preparation of Alycin.

Alycin is Merrell's Natural Sodium Salicylate—obtained from the natural oil of birch—associated with a balanced alkaline formula. The analysic effects of sodium salicylate are thus enhanced by the alkalinizing action of the base.

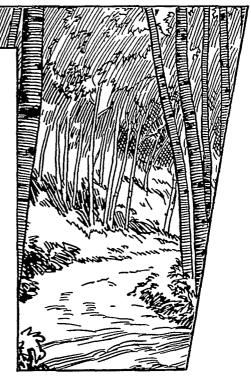

Wherever the salicylates are indicated, Alycin gives the most satisfactory response.

## PROBLEMS IN CHILD GUIDANCE\*

By ERIC KENT CLARKE, M.D., ROCHESTER, N. Y.

W ITH the beginning of the Mental Hygiene movement some twenty years ago, a complete change occurred in the field of Psychiatry. From the work that has been carried on within the asylums of the old days, where the nature of the work was largely of a custodial nature, Psychiatry has moved out, into the community, has taken a fresh start and rapid strides have been made in research and preventive work that bid, in the future to change much that today seem to be vague uncertainties.

One of the very important developments that have come from the Mental Hygiene movement, is the Child Guidance Clinic. It has come to fill a very important link in the Community Resources that are available for the conservation of childhood. To you, as pediatricians, it is my desire, to lay before you our Child Guidance Programme, for I feel that we have many problems in common and that by a close co-operation, much that is of benefit to the child can be evolved.

As busy pediatricians, called upon by distressed parents for advice in the management of behavior difficulties that have developed, you are in a strategic position to encounter problems, and yet the pressure of work frequently renders it impossible for you to take the time to go completely into all the factors that have come to gether to produce the situation, or to carry through a complete investigation of all the elements that form the background. It is here that the Child Guidance Clinic equipped to render a specialized service can come to your assistance and undertake the study and treatment of these children in a manner that is not possible without the clinic.

To us, at the clinic, are coming an increasing number of cases, referred by the pediatrician, and also direct with their parents. Most of these present difficulties that are severe and of long duration, while others just developing and the parents, usually the mother, come seeking ad-

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 4, 1930.

vice that will prevent a serious situation from being reached.

Our procedure starts with a complete physical examination by a pediatrician, and if there are any defects that require correction, these are attended to, or taken into consideration in the plan of treatment, to be carried through. Frequently, the pediatrician is working with us throughout the treatment, and there are consultations with him as to the progress of the programme.

The Social History forms a very important part of our study for it is in this way, the general reaction of the child can be obtained and significant data secured that are used in the interpretation of the facts that go to cause the difficulty. We have found that to get our worker, if the child is very young, to go as a casual visitor to the home, and to observe the child's performance in his own surroundings, throws much light that might have otherwise been overlooked in the initial stages of the study. With children of school age, a detailed school record of both academic achievement and social attitudes, is obtained, thus assurring a complete set of information concerning the child, at home and outside.

The psychological study adds more in the way of understanding the child's ability, his intellectual capacity, his special aptitudes and disabilities, and his placement and achievement in school.

The psychiatric study is directed toward his emotional endowment and the interpretation of the facts obtained in the preceding physical, social, and psychological studies, in relation to their bearing on the present situation.

It is only after this data has been assembled and interpreted that we feel we are in a position to undertake a treatment plan.

From this outline of clinic organization, it may be seen that we are well equipped to assume the responsibility of treatment of a limited number of cases that are referred to us, and the pediatrician, who in his daily rounds encounters such cases, acts as our outside community agent, and in return we can save him much wear and tear by undertaking treatment of the case.

During the last few months, we have had many children referred for study where there has been a physical handicap that has played a large part in the production of the behavior difficulties. These have ranged from mastoids with varying degrees of impairment of hearing, through the post-encephalitic, and poliomyelitic cases, diabetics, and feeding problems. the treatment is as a rule much easier and satisfactory, for the causative factors are closer to the surface, and where maternal solicitude is the chief difficulty to be overcome, cooperation is usually easy to obtain, for the protective mechanism has a real basis and when once the mother can be convinced that her ramparts are detrimental to the child, they can be overcome.

Where maternal protection exists without physical basis, the problem becomes more difficult and the focus of treatment shifts from the child to the mother, for the most frequent cause is that the mother is using the child as an emotional safety valve, and that legitimate channels that would otherwise serve to absorb her emotions are blocked.

One of the most difficult and disappointing cases that has passed through our clinic was a small boy of four who came to us a feeding problem. Although four years of age, he would swallow no solid food. He had only recently been removed from the bottle. He did not know how to masticate food or swallow it. If given ordinary things that children of his age thrive on, he would produce a pellet of food which he held against the palate and after a time, would reject it. In our Nursery School where he attended for a month, he held food for as long as two hours before returning it, although some headway was made.

Physically, this child was in fair condition, considering this treatment, and there was no evidence of any organic basis for his habit. The psychological examination was unsatisfactory, and although the test indicated that he was retarded, it was felt that he had ability, but was so dependent on his mother that he would not cooperate, or attempt much of the test. Our final estimate was that he would probably belong in the low average or dull normal group of intelligence, and we were convinced he was not feeble-minded.

He had long curls, over which the mother lavished much care. He had attended Nursery School for about ten days where one of the other small boys made the discovery and remarked "Why she is a boy." Up to this time, on the strength of his curls, and manner, in spite of his name "Billy," the other four-year-olds had accepted him as a girl.

The Social Investigation gave much informa-The mother was middle-aged and very repressed and unhappy. Her husband was over sixty, had been married before and had a grown family. He had his business, a restaurant that kept him busy long hours, and his interests outside of his work were away from home. The parents and child lived in drab unattractive quarters over the restaurant, had meals in the restaurant. The mother had no friends, no outside interests and spent her time idolizing the child. There was little in the house to occupy her. The preparation of the baby's bottle was a real joy and the straining and putting of vegetables through a fine sieve, was something she alone could manage, as restaurant food would not do for the baby.

The psychiatric study had little to contribute for the boy was a silent, fearful youngster, who wept if his mother left his sight. There was much that was of interest in the mother, but her wall of reserve was so strong, and her desire to keep her child an infant so strong, that

little headway was made.

After much persuasion the child was finally brought into the hospital for house observation in the hope that if the mother were removed some headway might be made. The mother could not stand the strain and removed him promising to return him after some family event. The stipulation was made that we would not re-admit him unless he had his hair cut before he returned. This was promised but when he returned at the appointed time his hair was still long and the mother was begging that she wanted to have him photographed with his curls "next month."

Some headway was made in teaching him to swallow and he was getting a fair start. He would drink from a cup holding it himself, and was taking mashed potatoes. Our efforts were mainly directed toward the mother. Efforts were made to try and get her interested in outside activities, but she became more repressed, moody and unhappy, to the point that she could no longer stand the strain and removed the child.

Although this case must be regarded as a failure, there is sufficient evidence to show that our Child Guidance type of approach was producing results, headway was being made, and that intensive training in a group of children his own age, under trained direction, could have succeeded with the proper backing from the home. One other case that may be of interest to you as pediatricians, is a small girl who is now doing splendidly after a long period of indifferent progress. This child who is now eleven has had a long series of misfortunes. The emotional upset, and the family attitude were both serving to interfere with the treatment of diabetes, for which she has been having treatment for three years.

This case was referred for study by the pediatrician, who continued to carry the case throughout our study. The child was at a standstill, and there had been frequent sugar stealing orgies, temper tantrums, irritability, and a change of personality. The mother was greatly concerned over the little girl's thumb-sucking which was causing malformation of teeth; several other minor mannerisms caused the family acute discomfort.

Lucy' was the second child of a very high grade family. Up to the age of seven she was a particularly fine, healthy, happy youngster. She started kindergarten at five and the teacher found her to be the most responsive of the class. At six she was promoted to first grade and got along well for one month and then developed a strong dislike for school. By Christmas she was very difficult to manage, and was in constant trouble. At the end of the year, she failed to pass, but the teacher who was young and inexperienced could not face the prospect of another year of Lucy's bad behavior and passed her into second grade.

The teacher of this grade was more mature and understanding, and determined to win this child, whose reputation had preceded her. At the end of the first month, the teacher sent for the mother and asked if there had ever been an eye examination. The mother said that it had been done by the school nurse the year before and vision had been reported as satisfactory. Beyond this no examination had been made. The teacher felt that the child was not seeing properly and so the eyes were examined by an oculist who found a marked vision defect requiring glasses.

Once these were supplied there was a marked change in behavior and for the balance of the year the child was again the same enthusiastic responsive youngster, but handicapped by her lack of foundation in first grade work.

Early in the next school year, when she was eight, it was discovered that she had diabetes, and so she was removed from school and hospitalized for six weeks. She was in a private hospital, where she was the only child, and consequently was made a great deal of.

Shortly after her return home, and to school, the mother came to the hospital for her third confinement. Lucy's diet and treatments were too difficult to be carried out at home during the mother's absence and she returned to the hospital, remaining an additional four weeks. This added materially to her spoiling.

Six weeks later she developed whooping cough and through an error received an overdose of some cough mixture, containing atropine. For two days, she was actively hallucinated and completely disoriented, not recognizing any of the family and in a state of extreme terror. Her world was one of hopping rabbits and massive whales darting all around her.

Fears have formed an active part of her problem since that time, although in the last few months they are gradually decreasing. Even minnows nibbling at her legs while in bathing are sufficient to precipitate profound fear that is undoubtedly based on her period of hallucination.

Her year of misfortune was not at end, for six weeks later the entire family were nearly asphyxiated by a gas leak, which added considerably to Lucy's list of fears.

The family picture of Lucy gave some extra

clues that were of importance,

There is an older sister who is exceedingly bright, who has been an honor pupil throughout school, and is a most popular, talented giri. Her outstanding achievements have made it difficult for Lucy, who although a bright child, has been dragging along slowly in school on account

of all her physical handicaps.

Further the older sister is named after her grandmother and aunt, who idolize her, and shower all sorts of glory upon her, to the exclusion of Lucy who was named after her mother. It has been noted that Lucy sucks her thumb continuously when in the presence of her grandmother and aunt. Both are very upset by the habit and have made much of it. Lucy has never been known to suck her thumb in school. At home she did so frequently, particularly at meal time where it was especially irritating to her father. He tried to restrain his feelings, at times even leaving the table before the meal was finished, as he could not stand it, or he would blow up and order the child to stop. At other times he would talk vigorously to the sister, or make a big fuss over the baby to appear unaware of the thumb-sucking. Lucy was quite aware of the reaction she was producing and the mechanism was largely a play for attention, as she was extremely jealous of her sister and baby brother. She was anxious to receive the attention being showered on the others by the father. There was constant quarrelling with the older sister, with almost daily raids on her belongings. Lucy developed into a real pest whenever any of the sister's friends came to visit, until the sister refused to invite friends to come to the house.

Lucy's sugar raids were more frequent after a visit to the grandmother's or after some other event where the sister received praise. On a motor trip with her mother, and the grandmother, the aunt, and sister, all named for each other, Lucy was found to have candy and also sucked her thumb so audibly that the mother, in desperation, came home by train with Lucy, rather than face the remarks of the others for a longer period. Lucy certainly received her share of notice on the trip, and

if the comments were not of approbation, there was at least no opportunity of complimenting her sister.

The mother was found to be a most understanding woman, of good judgment. grandmother and aunt proved difficult until practically eliminated from the picture. father cooperated excellently, and although he occasionally exploded when over-tired, helped a great deal. The sister was of great help, and once she understood the cause of the reaction against her, changed her tactics so that she is now Lucy's great hero, rather than a hated rival. A change of school and the addition of many more outside activities that were formerly considered too strenuous, riding particularly, have been useful. Lucy decided she wanted to play the violin and made all the arrangements for lessons herself, before mentioning it at home. She now plays in the school orchestra and is the youngest child of the group. She no longer has temper outbursts and has not sucked her thumb for months. She has become quite popular, has many friends, has made no recent sugar raids, and has shown a corresponding physical gain.

The change has been so marked that arrangements have been completed for her to attend a Girls' Camp for the summer, where they can continue her diabetic treatment and diet.

In this case we feel that although the physical condition seemed to be the important one, the emotional upset was the larger and no headway could be made with the physical until the emotional turmoil was reduced.

The history is a complicated series of misfortune, causing the original picture with the demand for attention, the jealousy of her sister, her feeling of failure in school, the realization of her inferiority, her fear of rejection by the family, and the paucity of constructive outlets all combined to produce the picture as we found it. There may be other outbursts to follow but at present all is serene, and we hope, with the aid of tutoring, for a double promotion this year.

We feel that there is a very definite place for our Child Guidance Clinic in the community programme of Child Welfare, and yet so often we find that the pediatrician and the general public avoid us, feeling that the Clinic is for abnormal and feeble-minded children. Psychiatry has so long been connected with the grossly abnormal, that the thought of the preventive work that may be done is slow in acceptance.

In our clinic we have recently established two school classes for research purposes. Our first group is for pre-school children who pre-

sent behavior problems, and who require a period of training. We do not accept children who are obviously feeble-minded. Several of the cases that have been accepted have been retarded, but at the time of our original study, it was felt by our group that there were potentialities and that the case was hopeful. Two doubtful cases were decided after observation of two weeks to be defective and were excluded. Two were discovered to be deaf and in need of special teaching that we were not equipped to give. Several who were retarded on admission have done exceedingly well, one a boy, a post-encephalitic case, making a gain of one year in mental development according to tests, in four months. The change of personality of this child from an incapable, dependent semi-invalid to one who has taken his place in an ordinary kindergarten primary, has been most gratifying.

In this group the range of problems has been from straight feeding problems with personality difficulties, as was the case with Billy, the spoiled, only child with temper tantrums. to two pairs of twins. Of one pair of identical twins, the stronger child was rejected by the mother who favored the weakly brother. Our study revealed mother's "Angel child" the more difficult of the pair. The second pair of twins, a boy and girl, had had repeated mastoid operations with subsequent fear reactions to all outside the home. Both sets of twins have now graduated fairly well adjusted.

The second group is for children between eight and twelve. Here we have gathered a group of the most difficult children in town. It is too soon to report the findings in these children, as the class has been in operation but a short time. We hope from our studies to work out a system of education that will enable the public schools to adjust these children who now serve to disrupt both the school program and the home. At the same time, the studies of the less severe problems appear to be of value in overcoming difficulties that cause considerable anxiety to both parents and teachers.

In Rochester we are particularly fortunate in the community organization as there is the fullest cooperation from all sources, the pediatricians, the school authorities, the Courts, the Welfare and Protective agencies and the health authorities. Furthermore the city is of a suitable size, so that one gets a fair sample of every grade of society with their typical environmental problems, a social organization that is well integrated and yet there is not the great mass of humanity that one finds in the larger cities where the efforts of one group are lost in the very magnitude of the population.

#### SPINAL ANESTHESIA\*

#### By LEO F. SIMPSON, MD, FACS, ROCHESTER, NY

EMBERS of the Niagara County Medical Society

When your worthy President asked me to read this paper he stated the subject should be "Spinal Anesthesia," and I intend to limit myself to that I am not here as an anesthetist, but as a general surgeon I am, moreover, not here to defend spinal anesthesia, or to urge you to use it

You will even be spared the recitation of the statistics of others who have had greater experience than I What I hope to tell you is what Spinal Anesthesia has done for me personally,

and what I have done with it

My experience is limited to 750 cases in my private practice, and in my ward service at St Mary's and Monroe County Hospitals. I have had no deaths in this series, but you can see that is no great feat in such a comparatively small number of anesthetics. I am enthusiastic about it, but I have never forgotten that there are many other good anesthetics.

All anesthetics are potentially dangerous Years ago I lost a patient, apparently from novocain shock, following a simple infiltration for a hermotomy Have seen them die on the table following ether, choloroform, and nitrous oxide gas. They die under spinal anesthesia also I know that thirteen have died in greater Boston, one in Hornell, one in the Pitkin Clinic, one in Syracuse, one at the Strong Memorial Hospital in Roches ter, and, of course, there must be many others

The high percentage of pulmonary complications, with the prolonged hospital stay, post operative hermas, and even deaths after inhalation anesthetics, makes one believe that the small number of deaths occuring on the table is no criterion

ot their real danger

Spinal Anesthesia should be placed in the class of comparatively dangerous anesthetics so far as its immediate effects are concerned, but if we count the time from that in which the patient goes on the table until he leaves the hospital, Spinal Anesthesia must be considered a comparatively safe anesthetic

Most general surgeons of my acquaintance are still individualists — individualists in their office examinations of the patient, in the hospital making the final decision for their private patients, and even to the operating room where a constantly changing staff of internes and nurses make him carry a load that he cannot shift

He can never become a statistical bureau, takes added of value whenever he can get them, uses them and gradually evolves a technique on which he stands or falls

In the last analysis he is on trial by the people

He has to evaluate the heart

Read at the meeting of the Niagara County Medical Society January 14, 1930

strength, the kidney function, the presence or absence of pulmonary complications to interpret laboratory findings, to know the dangers of obscity, hypertension and controlled diabetes, to estimate the psychic capacity of the patient to withstand surgical trauma, to do all of this to the best of his ability, and in addition, to decide the method of anesthesia when he operates

I do not mean to imply that he should not obtain the assistance of the internist in every way possible. To me they have been invaluable many times, and if they tell me definitely not to go ahead I usually stop. What I mean is that he cannot surrender his judgment easily, or try to evade responsibility for the outcome. He cannot pass all responsibility to the anesthetist in case of a fatality, because he, himself, has chosen the anesthetic

So whether he likes it or not, and no matter what assistance he can gather around himself, a general surgeon has to be an internist—who

operates

It has been said that a patient can stand a great deal of poor mechanical surgery but will quickly succumb to poor surgical judgment, and I assume that the choice of the proper anesthetic for the individual under consideration is surely a part of surgical judgment

One of my old friends now gone, in my judgment, a great internist, once, in a droll moment, when speaking of surgeons, said that the general public has always had to sacrifice a certain percentage of their number in order to make good surgeons it was the price they had to pay for having them. I wonder if that applies to anesthetists too!

It is the motto of all honest physicians that the safety of the patient should come ahead of all

other considerations

It is his business to see that his patients not only leave the operating table alive, but that they leave the hospital alive. A patient is just as dead who succumbs to a pulmonary complication three days after operation under ether anesthesia, as he would have been had he died on the table following spinal. The aim, of course should be, not to have either event happen.

It is my experience with frequent post operative pulmonary complications that made me con-

sider spinal anesthesia

We were, at that time, using other and gasether mixtures, occasionally local infiltration with novocan in addition, but in order to get good relaxation ether was nearly always required in greater or less amount. Ethelyin was used in but one hospital and the Board of Manigers hive now discontinued that. The latter appealed to

me very much and we had no pulmonary complications.

In the past year or two the theory of the causation of pulmonary complications has changed, as you know, and the addition of hyperventilation of the lungs with CO<sub>2</sub> and O at the close of anesthesia has markedly reduced the incidence of them, but that was not enough to make spinal anesthesia unnecessary. It had opened a new field, and deserves a place among our methods of anesthesia.

I then became interested in the work of Pitkin, visited his clinic, studied his methods, used his technique and immediately the post operative picture of my patients changed. I have used his preparation of "spinocain" exclusively in my spinal anesthesias.

Pitkin, as you all know, had elaborated a solution which he called spinocain. It consists essentially of a solution of novocain in normal saline to which he has added gliadine, the mucliganeous content of wheat starch, alcohol and strychnine in

carefully worked out proportion.

The purpose of the starch mucilage is to have a solution that would prevent dissemination of the novocain in the spinal fluid, that would remain en masse until the anesthetic drug had become fixed or absorbed, that would not inhibit anesthesia, but regulate its durability and intensify its action. It also reduced the toxicity of novocain permitting three or four times the amount of this drug to be used without harm.

The alcohol was added to make a solution of lighter specific gravity than the spinal fluid and

which made it controllable by gravity.

Strychnine was added, because, of all drugs tested, it was the only one capable of acting as a stimulant to the vaso motor constrictors in the presence of novocain.

In addition to its increased safety over other solutions used in spinal anesthesia, the factor of its contrallability was stressed. That is, by modification of technique the upper level of anesthesia could be predetermined.

Many men use neocain, procain or novocain alone, and are skeptical regarding the alleged advantages of spinocain. I have no quarrel with them. The only one I can talk about is spinocain.

Pitkin also utilized the specific blood pressure raising properties of ephedrine in his preoperative medication and so anticipated, or made much less sure, any possible fall due to novocain. During the past year or so I have also used Sodium Barbital preoperatively, as it is claimed to be specific in preventing novocain or cocain poisoning with, I believe, definitely improved results.

Besides the already enumerated advantages it should be remembered that this form of anesthesia, can be administered and induced very rapidly, and by its use the surgeon is freed from the vagaries of different anesthetists. If you should

be fortunate enough to have with you a highgrade anesthetist this statement, of course, does not apply. All other factors remaining constant, the fewer the links in the operating team, the fewer the chances of trouble arising.

If one uses spinal anesthesia considerably one is apt to succumb to its seductive influence, and fall into the error of fitting the patient to the anesthetic instead of fitting an equally good, or

possibly better, anesthetic to the patient.

I try to use it just as I would ether or gas. If spinal is best for me, but bad for the patient, the patient gets something else. If the patient objects to spinal, or insists on being asleep, or if they are very nervous and panicky, and, therefore, hard to handle, I order general anesthesia. Spinal Anesthesia should be but one of our tools and it should be in the armamentarium of all surgeons and anesthetists.

It is not advisable to use it in children, in the very anaemic, in severe shock, in the very septic, nor in other very poor risks. I have broken all of these rules, but only for sufficient reason. As, for instance, recently I amputated both feet that were severely crushed in a railroad accident—the patient being in severe shock. Rather than put him to bed and wait for him to recover from shock, which they usually do not do, by the way, I blocked the shocking impulses going up the cord and removed their cause. He recovered. general, however, it is usually wise to avoid the I have not used it in any operations above the diaphragm, in spite of the fact that there are many men who insist that it is safe and teasible to do radical breasts, goitres or mastoids by this method. They may do it—I do not care to.

It has been stated that it should not be used in cases of hypertension or cardiac disease. I have used it in both many times, but only where I could not use local. There has been much less strain under spinal than under general anesthesia.

It has been stated that the pulmonary complications are as frequent under spinal as under general anesthesia, but that is certainly not my experience. I have had practically none. We have added hyperventilation of the lungs in the shallow breathers just as we have added it to all

cases of general anesthesia.

Because of its well marked tendency to increase peristalsis, it has been considered inadvisable to use it in cases of intestinal perforation, and, especially, in intestinal obstruction. This is not borne out in my experience. One of its greatest fields, in my experience, is operating strangulated hernias, especially the large strangled ventral hernias occasionally encountered in obese women. You can not only operate on them with ease, but what is most important, closure without tension is easier. That is a marked advantage in any incision, especially in the upper abdomen.

As for perforations and peritonitis, we all

know the depth to which general anesthesia has to be pushed to get relaxation and when you have operated a few times for perforative appendicitis, or sutured a perforated duodenum, you working easily, and the patient, who a short time before was in agony, now smiling and chatting with the nurses, you are in danger of being converted.

As for intestinal obstruction within the abdomen, who would go back to the old days of struggling patient, intestines out faster than you can put them back, while you are trying to relieve the obstruction, shock going on a pace; when, today, the surgeon can open a quiet abdomen—lift up the relaxed walls, relieve the obstruction, if possible—do an enterostomy or whatever seems indicated with great ease and with no shock to the patient.

Other objections to it are that the anesthesia is not as controllable as we are led to believe, that alarming falls of blood pressure occur, that nausea and vomiting on the table are frequent, that post operatively severe headache, signs of meningeal irritation, diplopia, transcient blindness, leg pains and palsies are common.

I can only speak of these objections in the light of my own experience. That the height of anesthesia cannot always be definitely controlled, I will admit. It can in about 90 per cent of the In a few I got no anesthesia at all, or perhaps only to the knees, possibly due to error in technique. We are advised in these cases that if anesthesia is not established in fifteen minutes to roll the patient over and repeat the dose. I have done this but once when it seemed to me that spinal anesthesia was imperative-in all other cases I proceded under general anesthesia. In another small percentage, anesthesia extends too high for my comfort at least-in fact once or twice I have seen it to the top of the scalp—how much farther it went I do not know-and let me tell you when I had this experience first it took the operator as long to recover as it did the pat-Many operators nowadays deliberately induce this with neocain and claim it to be perfectly safe. I would not like to have it induced on myself. It is interesting to note that in the cases where I have seen this high ancethesia it has been limited to the sensory segments. They could move their arms, could swallow, and seemed to have no embarrassment of pulse or respiration. At the same time they had no use of their lower

As for the fall in blood pressure, my experience would indicate that often there is no influence on it at all, in the majority there is small fall which is in large measure regained within a half hour. These recover with little or no treatment. A few cases show a severe, or what might be called, an alarming drop. These cases are handled by the technique described later on, and in my experience have all recovered.

Nausea and vomiting occur rather infrequently, but when it does it is usually due to high ascent of the anesthetic and associated with fall of blood pressure, due possibly to keeping the patient horizontal too long after the introduction of the spinocain, before tilting to the Trendelenberg position. The other common cause is traction on, or manipulation of the organs in a portion of the abdomen not completely anesthetized—as for instance, examining for gall stones through a low incision made for a hysterectomy. Carbon dioxide and oxygen, plus the Trendelenberg, usually controls this symptom quickly.

As for the post operative sequellae — severe headaches I have seen but twice and they recovered in a few days by placing them in a slight Trendelenberg position in bed and administering four ounces of a twenty-five per cent solution of Mag Sulph per rectum once or twice at five hour

intervals.

As for signs of meningeal irritation I have not seen them. Pitkin has shown repeatedly that there is no increase in the cell count in the spinal fluid following spinocain injections. Neither have I seen diplopia or transcient blindness.

Of post operative pains in the legs, I have seen it in eight or ten cases—at times rather severe, but in no case did it last longer than three weeks.

I have seen no palsies.

I have used it in all of the commoner operations in the abdomen. I have used it in open competition with ether or nitrous oxide, used it in the main on good surgical risks, favoring it if anything, but not going out of my way to urge it, unless I thought it definitely superior to any other form of anesthesia. I would estimate that in the past three years about fifty per cent of my operative procedures below the diaphragm have been performed under spinal.

It is definitely superior, other things being equal, when operation is needed in a patient suffering from stomatitis, acute or chronic pulmonary disease, asthma, nephritis, diabetes or dis-

turbed liver function.

In any case where technical difficulties are anticipated, or whether the operation is apt to be prolonged as inflammatory disease in the pelvis malignancies of the intestines or pelvis, difficult gall bladder or stomach work, in ventral hernias, intestinal obstruction or perforation of any kind, at least, if seen early, and in peritonitis, spinal anesthesia should head the list when considering the choice of anesthesia.

In the various operations performed by the gynecologist (in our hospital they are all performed by the general surgeon) it is ideal. It should not be used for trivial operations.

In nephrectomies and prostatectomies I have had great comfort with it, and in these cases it is particularly indicated.

One of my orthopedic friends tells me that it is invaluable in the reduction of difficult fracture

of the lower extremities, and, also, in open bone work.

I have used it in six cases to relieve post operative distension due to paralytic ileus folowing abdominal operation under other anesthesics. The results were brilliant in three and negative in the other three. I do not think it is of value in the distention due to peritonitis, and undoubtedly very dangerous to use it as the sole remedy if obstruction is present. Here, however, it may be a diagnostic agent (W. Mayo).

Under spinal anesthesia, by the way, post operative abdominal distention is rare and the pa-

tients rarely have to be catherized.

In the ordinary run of abdominal surgery it can be used if thought advisable as well as ether or gas, but it has to be surrounded with more precaution than either of the latter, notwithstanding the statements to the contrary from enthusiasts.

At present we are in a wave of enthusiasm all over the country over spinal anesthesia. There is great danger of adopting procedures as fads in medical practice. This is, of course, to be condemned. A method of anesthesia must have a more solid basis than faddishness to recommend One using it should surround himself with every safeguard to prevent fatality which can come to any one who uses this, as well as any other form of anesthesia. People, as you know, have certain orthodox methods of dying, even under anesthesia, and view with distrust and alarm any one who would start anything new. I believe, therefore, it should be used whenever it can be with benefit to the patient, and be used by many men so that if a fatality should happen the doctor would have the defense and sympathy of competent men.

Assuming that spinal anesthesia has a place in surgery that is unique, and realizing also that there are definite potential dangers in its use, if one is alive to those dangers, they can, for the most part, be avoided. If definite trouble is encountered, treatment is extremely effective. The anesthetist or surgeon should not venture on the use of spinal anesthesia with hazy ideas or indecisive action. If he is to safeguard the anesthesia he should have a very definite clean cut plan concerning every aspect which bears on the question of vascular depression.

My own technique stresses two points: Prophylaxis and adequate preparation for extreme emergency. Under preventative measures, FIRST—should come the proper selection of cases and this is a matter of judgment. In general, as I have said, it should not be used for very poor risks. There might be certain factors about a poor risk today that would induce me to use spinal that were not present in a similar case yesterday. Of cleven fatal cases in Boston, six were poor risks and one was very poor.

The SECOND prophylactic measure is to see that the patient has had an adequate amount of fluids before operation. They do better. Patients whose vascular system is full of fluids stand a

drop in pressure better.

The THIRD measure is the use of Sodium Barbital. I give at least ten grains three hours before operation. It seems to have a definite value. The nose and throat men of my acquaintance tell me that since they have used it the transitory shock so often noted in making cocain applications to the nose, or after novocain injections are absent. I have never used soluble Barbital hypodermically.

We use as a clinic hypo one hour before operation, morphine 1/8 to 1/4 with hyocaine 1/150. The latter is in ampules, and is never made from

the tablets. Atropine is never used.

The FOURTH—the use of ephedrine. I use it in 3/4 gr. doses hypodermically, two hours before operation in all patients whose blood pressure is below 110. It is used in practically every case in the solution of novocain that is used to anesthetize the site of the spinal puncture. An exception is usually made in cases where blood pressure is over 200. It is then omitted, but one must be watchful because a pressure of 120 coming on suddenly on such a patient may be very serious.

The FIFTH measure is that we charge the patient the fee of an ether anesthesia and I demand the complete and undivided attention of an

expert anesthetist.

It is her duty to have ready, in advance, one sterile syringe containing 3/4 gr. of ephedrine, in solution, plus 5 minims of adrenaline, and in another 5 minims of adrenaline. We have gone for many weeks, and never used either, but they are always prepared fresh each day I use spinal.

It is also her duty to take and record the blood pressure before anything is done because we have to have a standard to start from. She also has the tiltometer in place on the table, and when we are ready she places the patient in position for the spinal puncture. We will refer to her duties again. The next important prophylactic measure is the placing of the anesthetic. In our hospital the surgeon does this. In hospitals where there is a physician, who is the anesthetist, this duty is his

Spinocain is always given with the patient in the horizontal position with no pillow under the head and the arms extended over the head, and lying on the side of the body opposite to that upon which the operative work is to be done. If a midline incision is to be used it makes no difference. The head is brought down to the chest and knees to the abdomen, the shoulders and hips should be on the same level. The patient should never be sitting up when spinocain is being administered. Pitkin estimates that with spinocain given in the upright position, the fluid injected

will rise from the lumbar to the cervical region in from nine to eleven seconds—you cannot lay them down fast enough. In five cases that I know of death was due to this, and this alone. It is about the same as pouring an ounce of chloroform on a closed ether cone and clamping it down

on a patient's face.

Under aseptic precaution a wheal is made on the site of the proposed lumbar puncture, usually between the 2nd and 3rd lumbar vertebra, occasionally between the 3rd and 4th, with half an ampule of Pitkin's novocain ephedrine solution, the other half being carried in between the spinous processes. If the patient's skin is soft and white I proceed with the puncture. If it is tough, as it often is, I make a minute incision with a small bard parker knife, which makes it very

casy to start the needle.

I use Pitkin's needless of rustless steel, first bending them in a half circle after removing the These needles are stylet to detect any flaws. very fine and have a point beveled at an angle of 45 degrees, and will cut a minute trap door in the dura and so prevent leakage of spinal fluid, possibly the great cause of post operative headaches. The needle with its stylet is carried straight in and as it goes through the dura a snap will be felt and sometimes heard. If spinal fluid does not drop out at once, I rotate the needle, push it in or draw it out. If I am sure I am in the canal I am patient. If not, I reinsert the stylet, withdraw to the skin and try again. You all know how easy it can be and also how exasperating. Once I failed to get in at all and several times got incomplete anesthesia, probably due to error of technique.

If the spinal fluid drops easily I lock on the 4 cc syringe, containing the amount of spinocain I intend to use, and draw out on the plunger to

again make sure that I am in the canal.

Often times the spinal fluid does not flow freely and must be teased out while the needle is being rotated, and in certain cases it is necessary to remove the syringe from the needle entirely and catch the drops one by one as the piston is being gradually drawn back until the desired amount is obtained. This little trick has helped me often.

if I am going to do an operation on the vagina, rectum, or on the lower extremities, I merely slowly (and I think slowly should be emphasized) inject 2 cc. of spinocain and withdraw the needle.

If I am going to remove the gall bladder or do a gastroenterostomy, I have to expand the area of anesthesia in the spine and I do this by expanding the amount of solution to be injected. This is done by withdrawal spinal fluid into the syringe, say to 4 cc. injecting slowly to 2 cc., then withdrawing to 4 cc. and slowly injecting the whole amount. The amount of expansion necessary can be determined only by experience. Remember that the intensity and duration of the

anesthesia is dependent upon the amount of novocain in the area and that expanding dilutes it. So in a large individual with a longer area in the cord, and if a long operation is anticipated, it might be advisable to start with 4 cc. of spinocain and expand that.

So we have the spinocain in the spinal canal. The patient is now rolled on his back, the anesthetist holding the head of the patient to the table all the while. Then I take an Allis forcep and test for the height of the anesthesia. I usually find it at the desired level almost at once. If it is not there I continue to test until it is three inches below the level desired and then order the table to be placed in five degree Trendelenberg position, as shown by the tiltometer. It will

usually rise three inches after this.

The patient is kept in this position throughout the operation in uncomplicated cases, and it is the position of safety. The shoulder pieces for a lower position are now adjusted. Now the anesthetist steps into the picture, for early treatment of vascular depression is one of the best of prophylactics against further depression, and possible collapse. Before a certain point is reached in the progress of the depression the blood pressure may be easily controlled by subcutaneous medication and posture, but after this point is passed the patient is out of control by this method and intravenous medication is needed.

The point at which treatment should be started varies. In general it should be earlier with a sudden drop than with a slow sag. Two-thirds of the normal preoperative level of blood pressure is the point, at or above, which we would like to keep the blood pressure, in the five degree position. With a greater degree of Trendelenberg

this point may be somewhat lower.

In spite of the statements of many men of experience that it is useless to take the blood pressure, that it always falls, and always comes back, we take it every five to ten minutes. The pulse, respiration, and color are also watched, because to the sensitive anesthetist they tell things.

The absence of fatalities in these cases is the reward of being wide awake and acting early. Being wide awake and watchful enables one to get data to form judgment when the judgment is of value, and acting early is on the same principle of stepping on the burning match before the house is afire.

If it should be necessary, as it occassionally is, to induce general anesthesia, in addition, great care should be used and the induction should be

extremely slow.

Well, say we have got the patient anesthetized, and we are blissfully on our way, when the anesthetist tells us that all is not well. What is to be done?

The anesthetist, after giving the alarm, immediately tips the patient into a high Trendelenberg position. This, I believe, is a most valuable

measure. Another nurse immediately gives the hypodermic of ephedrine-adrenaline mixture—and withdraws the patient's arm to expose the elbow for a possible intravenous injection.

The anesthetist swings into play the carbon dioxide and oxygen mixture and either myself, or my assistant, drops out to give adrenaline in the vein. Any other route is a waste of time and five minims in the vein will almost wake the dead.

This is our routine, and I may say that I do not intend to have them die if I can prevent it. In this plan of action one might stop at the lowering of the table or after the administration of the ephedrine-adrenaline solution, or have to go through with the whole plan in order to bring the patient back to normal. We seldom have to use it, but we are prepared to move into action in a minute at any time.

Careful attention to the details of the technique, where this anesthesia is justified, will usually be rewarded by maximum safety to the patient, total freedom from pain, unparallelled relaxation,

a relative anaemia giving a more bloodless operative field, quiet intestines, needing little or no artitificial restraint, interruption of shocking impulses en route to the central nervous system, simplification of the technical aspects of surgery, and freedom from post operative complications—all contributing to the ideal.

I cannot guarantee that you will always attain the ideal. In medicine and surgery, where there are so many variable factors at work, it is rarely attained.

Just as when, considering happiness, all that our forefathers guaranteed was the "pursuit of it"—so with the ideal anesthesia.

# THE MANAGEMENT OF CHRONIC SINUS DISEASE\*

By W. V. MULLIN, M.D.; CLEVELAND, OHIO

SINCE the general principles governing the diagnosis and treatment of diseases of the nasal accessory sinuses have been thoroughly detailed in the many textbooks on the subject, it would seem that there would be little more to add. The individual application of these principles, however, seems to vary so much with the rhinologist that success must come through his personal interpretation of their meaning in each case under his care. It is in the hope, therefore, of bringing forth the views of others that my own beliefs are presented.

# Preliminaries to Treatment of Sinusitis

Emphasis upon the taking of a careful, detailed history may seem trite, but the importance of such a history in arriving at a correct diagnosis and its influence on the proper treatment to be instituted cannot be overestimated. Unfortunately, this necessary preliminary to treatment is only too often neglected, one reason perhaps being the small size of the average history card, which allows space only for a few diagrams and a list of symptoms followed by blanks for check marks, but makes no provision for a history of the general symptoms and course of the case. Whatever the reason for neglect to take a proper history—inertia, lack of time, space, or otherwise—the consequences will be identical, for

the symptoms found necessarily will determine the type of treatment.

As an example, consider the symptom of discharge, and the difference in treatment when pain or odor accompanies this symptom; or consider polypi, which sometimes produce only local nasal obstruction and at other times are the cause of bronchial asthma, when they require more radical treatment; or again, consider the contrast between the methods used in bronchial asthma, bronchitis, or bronchiectasis when sinus symptoms are present and those employed when they are absent.

After completion of the history, it is advisable to question the patient as to what he expects from treatment and the results for which he hopes. Then the physician must determine the results which he believes can be achieved. Can he remedy a slight postnasal discharge by local treatment, or will operation be required? Can an arthritis be relieved by a sinus operation? He must weigh the conditions present with the methods available, and give the patient a clear understanding of the chances of success or failure.

In sinus disease it is well to think first in terms of pansinusitis, since the mucous membrane is continuous with that of the nose and has practically the same blood and nerve supply, and then to determine the comparative responsibility of the individual sinuses in the production of symptoms.

<sup>\*</sup>Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 3, 1930.

I have been impressed with the influence of a deviated septum upon the failure of sinuses to recover after acute infections, and by the same token a well-performed correction of this deformity often is the first form of operative treatment to be undertaken when sinus disease is present.

Needless to say, every procedure that will aid diagnosis should be carried out. After the history and inspection, a well-taken and skilfully interpreted roentgenogram is of inestimable value. In this connection there has been much discussion of the merits of lipiodol. While it frequently is of great value and I should not wish to belittle its usefulness, often it is employed unnecessarily and the results obtained are merely spectacular. If the time spent in preparing the patient and instilling lipiodol were occupied in studying a well-taken film with a roentgenologist skilled in this field of work, an equal amount of information would be obtained in the majority of cases.

#### Symptomatic Treatment of Sinusitis

A postnasal discharge is a most annoying symptom, but one that perhaps is not always associated with sinus infection. Certainly, removal of part of the middle turbinate or opening of a few of the ethmoid cells offers nothing in the way of treatment for this symptom. Recently I heard a lengthy paper presented, discussing in detail a method of operating conservatively upon the ethmoid labyrinth when but a few of the cells contained pus. It was my feeling that in every case described equal benefit could have been secured by the use of nasal packs and suction, leaving the mucosa intact.

A discharge with odor, on the other hand, is indicative of sinus infection with retained secretion, usually of saprophytic origin, and most often this type of infection is found in the antrum. The response to treatment, of course, depends upon the ability of the lining mucosa to recover function after aeration and drainage.

In 1915 I began antral irrigation through the natural ostium, and have now given up inferior meatal puncture entirely. The use of the natural ostium has many advantages. Irrigation is much less painful, and therefore is done earlier and more frequently. By this method, I believe, as much can be accomplished as by making an inferior meatal window. I have therefore abandoned intranasal surgery upon the maxillary sinus, and treat it conservatively through the middle meatus until it is evident that improvement cannot be expected, and then perform a Caldwell-Luc operation under local anesthesia, removing all the mucosa.

Pain is a symptom that demands prompt relief. It indicates either pressure or bone involvement, but it is not indicative of the amount of infection within the sinus, nor is it a localizing symptom. Often it is the source of confusion on the part of general practitioners as well as patients, who are apt to believe that the pain should be over the affected sinus.

Polyps are the nemesis of every sinuologist. In their treatment I make a distinction between those producing only nasal obstruction with local symptoms and those associated with asthma and secondary conditions in the chest. In the first instance I make no attempt at radical surgery. I remove all the polyps in sight, warning the patient that they will probably return and that observation and further removal will be necessary at frequent intervals over a long period of time. When polyps are associated with bronchial asthma, however, thorough eradication of all infected and polypoid membrane is necessary—this, of course only after the patient has been thoroughly studied for any allergic manifestations.

Of all the sinus conditions the hyperplastic polypoid ethmoid seems to give the poorest and slowest response to any type of treatment. When surgery upon the ethmoid labyrinth is required, it should be thorough enough to relieve the symptoms without any effort to make any one type of operation fit every case. This is the only feasible plan when the irregular anatomical and morphological structure of the ethmoid bone is considered. The expression, "complete exenteration" of the ethmoid cells, therefore, is a misnomer.

There has been much discussion of the sphenoid sinus as an independent entity, but this description is not satisfactory according to my experience. I have seldom seen a diseased sphenoid sinus except in connection with the entire ethmoid labyrinth,

In treating the frontal sinus I follow the same general plan as in treating the maxillary sinus, practicing conservatism as long as possible. If removal of the anterior tip of the middle turbinate or the ethmoid cells around the nasofrontal duct will not relieve the symptoms, I prefer to approach it through the external route. I have long since abandoned all intranasal frontal operations.

In the majority of cases in which an external frontal-sinus operation is required, a unilateral pansinusitis usually is present. In this event, I prefer a two-stage operation, cleaning out the maxillary sinus and doing all that is necessary in the ethmoid and sphenoid areas, but not rasping or enlarging the nasofrontal duct. When the reaction from this procedure has subsided, I then perform the external frontal operation, preserving the anterior wall and its periosteum.

It has seemed to me possible to make fairly definite statements up to this point, but there is much confusion in my mind on several questions. it as a kind of specialization. I have found it very difficult, over a period of fifteen years in this work, to find young doctors who are willing to take it as seriously as it deserves. They come and go into the positions of Assistant College correct all remediable defects in students whether acutely ill or not before graduation."

#### A CASE OF BLACKWATER FEVER AND ITS UROLOGICAL ASPECT\* By CARLOS M DEL VALLE, M.D. NEW YORK, N. Y.

History Blackwater Fever was first studied by English physicians about twenty-five years ago in Africa, India, Jamuica and other tropical dependencies of England giving it the descriptive name because of the color of the urine passed by those suffering from the malady group of English scientists, among them Man son, formed a commission under the auspices of R C.PS for the study of this condition which they described as follows Concerning the etiology, English, French and German physicians have worked assiduously to find if the condition is in itself a disease or a variety of malaria, also if the syndrome is due to the use of guinine. This point has given rise to innumerable discussions Some are of the opinion that in certain proportion of cases, and assuming that Blackwater Tever is a variety of malaria, quinine treatment has given a mortality of over 25%, while in cases not treated with guinine the mortality was about

Symptoms It has been observed that this con dition affects mostly those affected with malaria, although the plasmodium malariae may not be found in the blood. In benign cases the onset is ushered in by chills, fever, general debility, anor exin and bloody urine, in severe types, with intense chills, high fever (about 40 C), delirium and bloody urine which at first looks like wine (red) but as the disease progresses, becomes almost black (like black coffee), continuing thus until the end either in death or convalescence When the fever is high, at first the pulse is of good quality and strong, but as the condition goes on, the heart becomes weaker and also the pulse and respiration in the same proportion

Differential Diagnosis An acute case is easy to diagnose, particularly if one has had some practical experience, it is difficult to recognize a case outside the natural or endemic zones, particularly after several years have elapsed of mularia and other tropical diseases

Prognosis The English estimate about 25% mortality but in the Canal Zone and in the Panama Republic, the mortality is estimated as high as 50% in true Blackwater Fever

Treatment There is no specific therapeutic The treatment at present course to be followed is rather symptomatic. The main dangers are anuria and heart failure. The anuria is combated by means of diuretics and urinary anti-In my experience the best results are obtained by the use of theobromine and urotropin in 5 gr doses alternating with each other The drugs are administered tild or q 4 h, according to the individual case etc, in spite of the fact urotropin has been known to provoke in certain instances hemoglobinuria the effect of this drug was noticed very promptly in my cases by the almost prodigious manner by which the urine became clear and free of blood as well as the ease and increase of micturition

History of the case Name L W A , age 42 born in Porto R. o, occupation, salesman

Complaints: Chills, fever, debility and bloody urine.

Family history: Negative.

Past illness: Has had malaria, about twelve attacks, but no other illness.

Present illness: Onset about four years ago and after having resided in New York one year. Had the first attack one very cold day in the winter while on the street and when least expected. When he arrived indoors, he had severe chills, and on passing urine it was almost black in color. The temperature was 40 C. that night, and remained high for three days. This patient came from the tropics following professional advice. He has had several attacks, always after or during exposure to cold. One day while in my office I had him immerse a hand in very cold water with the result that an attack was ushered.

Physical Examination: Pathological findings are as follows: Enlargement of the spleen about three finger breadths, pallor and emaciation. The heart is normal except for a heamic murmur which is not propagated.

Blood Pressure: Systolic, 100; Diastolic, 60. Blood Examination: Negative for malaria (several tests were made, particularly during the chills and fever periods).

# 

Treatment: A urotropin solution, as follows, was injected into each renal pelvis: Five grs. were dissolved in 20 c.c. of distilled water that had been sterilized by boiling and very slowly introduced until the patient complained of begin-

ning discomfort, then the catheters were removed and the patient ordered to rest in the recumbent posture for about an hour and allowed to go home. The catheters used were at first No. 4 because of slight stricture on both sides. So far eight treatments have been administered. I alternate injections of neo-silvo, 16 gr. in 10 c.c. of water, as above indicated, in both instances administered at a temperature of about 40 C. (respecting Nature's indication of 40 degrees in the fever). This amount of heat gives the patient considerable comfort. At present the urine is clear of infection as demonstrated by sterile culture specimen from both sides and No. 6 catheters are admitted readily.

The problem that presents so far as the anuria is concerned is its etiology. Is it caused by the (a) acute nephritis due to the malaria, (b) to the use of quinine, (c) obstruction of the ureters, (d) inflammatory process, or a combination of these? Whatever the etiology, it seems proper to establish a cystoscopic examination as a matter of routine and thus a field of research might be opened for the study from a different angle and the better understanding of these conditions.

Summary: My observations in several cases are that there is always an infection of the kidney tissue as well as impaired function. The renal infection is not primarily malaria, it is a secondary process that gains access to the kidneys (usually a strain of streptococcus or staphylococcus) due to lowered resistance of the renal tissue as well as the asthenic condition of the entire system. Such a condition favors infection since the kidneys are unable to resist the invading micro-organisms. The urine is bloody due to the infection, the destruction of cells, and the inflammation. Thus the "Blackwater" or bloody urine. An attack may be provoked by cold or any agent that may lower the resistance of the already weakened organs. My studies have led me to believe that "Blackwater Fever" is an infection of the kidneys as above described in a malarial patient.

#### HEALTH SERVICES IN COLLEGES

Every member of the Medical Society of the State of New York will find practical value in the report on page 1283 on "Health Services in Colleges and Universities of New York State," prepared by Dr. Mitchell for the Committee on Public Relations The thousands of students who go out from our colleges every year will be leaders who will exemplify their college training along physical as well as mental lines These graduates constitute a group which is the most influential one that the medical profession can reach

# PRESIDENTIAL COMMENTS ON CURRENT EVENTS-NO. 9

The many evidences of changing times, new social trends, and the broadening of medical practice are having the effect of arousing general medical interest all over the State. In nearly every county of the State there is aroused interest in the modernizing of relationships. It has a definite appeal to the profession in general. It seems to be the answer to the shifting of professional obligations from curative practice only, to the inclusion of preventive measures in a doctor's regular work.

I have completed a comprehensive inventory of the health activities in each county of the State, by whom initiated, and the relation of the local profession to them; the extent, beyond the theoretical support, that the profession has undertaken to correlate and cooperate with other health influences. All health agencies recognize that the medical man is trained in the technical character of medical service and that he is the only one qualified to render it. All that the non-professional agencies want is the medical man to lead They just want leadership, and if the profession of medicine is not willing to give this, then how can we justly continue to find fault with somebody who offers to help us to meet problems of public medical service that have been waiting for us just about as long as they will wait? The evidence is plain that the profession has begun to think on these questions. It has begun to look upon medicine as a public service in addition to an individual occupation.

Times are changing and, with our will or without our will, we must change with it. There are unsolved health and medical-care problems. The public naturally looks to the medical profession to answer them, but if the profession does not offer a plan and guidance, someone else will do so,—someone must answer insistent public demand.

There seems to be no great problem in scientific medicine. It steadily advances. Graduate education is expanding all over the State.

Many men in practice today can remember the authority that once surrounded the doctor in his community. His knowledge was essential to the individuals in the community. His relationships were personal, not surpassed by any other relationships in community estimation. The doctor was not only a leader in medicine but often in civic affairs. Every doctor who has been in practice thirty or forty years can see a great change in public opinion as to what is expected of the practice of medicine. The doctor was a leader in the conditions that prevailed a generation ago. I believe that he will become a leader in the new conception of what is expected of the practice of medicine.

The doctor today must recognize that there are new conditions and that there must be a new relationship to meet them. In no sense whatsoever is he to be any less of a scientific man, but he must broaden his viewpoint. He will not have to sacrifice any of his intimate relationships to individuals but he must meet certain new social conditions. It will avail him little to fight these conditions, and if he does, he will be defeated in the end.

The leaders of medicine see this change coming. Some of them say, "Fight it and retreat as slowly as we can." Others say, "Adjust our relationships, guide health proposals by organizations representing public interest, make use of all organizations and of all wealth, continue to fulfill the social function that the medical profession has always filled toward human happiness and human betterment. We sacrifice not one bit of our scientific attainments by doing this. only meet the broader conception of the practice of medicine; and after all, it is nothing more than to render to one's families and friends the greatest service that one human being can render to another,—to keep him from sickness and to keep him well. No other group in the world can give this service. Our responsibility for this to the public may be defined in words by saying, "The obligation of a profession to society is 'Of him who knows most, most is expected."

The public realizes, beyond question, that the doctor is better fitted than anyone else to render health service, and the public looks to him primarily for this service. Let us not be sensitive and let us not get our thoughts twisted because the public is struggling today to meet certain conditions that the medical profession up to the present time has not fully met. It will little avail us to fail to cooperate with the inevitable demands that are growing out of present-day social trends; and after all, why should we not face the issue squarely? We are a profession. We are not primarily directed by commercialism. There is just as much of a place today for the ideals of medicine as there ever was. Medicine today is more of a community problem than it ever was. The fact that there are various health organizations interested in human welfare, simply means that there are unsolved problems,-and that it is the only reason that they have gained a foothold. They are simply making a civic effort to bring to our attention certain problems that have not been medically solved. They are making the same kind of civic effort that prevails today throughout the world in all human relationships. Government understands this principle. Nations understand it. Industry understands it. medical profession is beginning to understand it to a greater extent than it is generally thought

The day is not far distant when the profession will understand just what is going on. The

trouble with the medical profession in public relations is essentially only this,—that it keeps about five years behind the trend of public opinion. As a profession, we have long advocated the betterment of public health and the public has long given us that responsibility. We have gotten so busy, however, with our economic problems that we have neglected to keep in close enough touch with public opinion and close enough to preventive medical trends that would, if adopted by us, ef-

face economic problems The speck of dust on an eyelash lins come to seem like a mountain when we look into the distance. We have become piqued for some reason that one can hardly comprehend. Is it because some other group began to do civic medical work and then to bring to our attention unsolved health and medical care problems, that we have not undertaken to improve?

WILLIAM H Ross

#### MEDICAL ETHICS

The metropolitan newspapers of the last few weeks have frequently reported interviews to the effect that the "Code of Medical Ethics" is antiquated, and that the doctors who uphold it are short sighted

How many doctors know exactly what the code of cthics is? So far as the written code applying to New York State is concerned, there are two codes,—that of the American Medical Association, called the "Principles of Medical Ethics", and that of the Medical Society of the State of New York, called the "Principles of Professional Conduct" These two codes are in no wise antagonistic, but since nearly all the leaders of the medical profession in New York State belong to the American Medical Association, they subscribe to both codes. In fact, a New York physician must belong to the Medical Society of the State of New York and subscribe to its code before he can belong to the American Medical Association.

The essential basis of each code is stated in Section 1 of that of New York, as follows ---

'Everyone on entering the medical profession and thereby becoming entitled to full professional fellowship, incurs an obligation to advance the science and art of medicine, to guard and uphold its high standard of honor, to conform to the principles of professional conduct and to comport himself as a gentleman"

The Principles define the basic relations of a doctor to his patients, his duties toward his fellow practitioners, and his obligations to the public. The Principles of the national organization generally go into details more deeply than those of New York State.

The newspaper articles were principally on the subject of medical advertising. Let us see what the two codes require. Section 31 of the New York code rends.—

"Physicians should not make use of special circles or any other form of advertisement for the purpose of inviting attention to themselves, they should not boast of cases, operations, cures or remedies, nor aid or permit the publication of any of the foregoing in the public prints. They should not invite lay visitors to be present at operations, in the case of a patient's family an exception may be made."

The Principles of the American Medical Association, Chapter II, Article I, Section 4, reads —

"Solicitation of patients by physicians as indi viduals, or collectively in groups by whatsoever name these be called, or by institutions or organi zations, whether by circulars or advertisements, or by personal communications, is unprofessional This does not prohibit ethical institutions from a legitimate advertisement of location, physical surroundings and special class-if any-of patients It is equally unprofessional to accommodated procure patients by indirection through solicitors or agents of any kind, or by indirect advertise ment, or by furnishing or inspiring newspaper or magazine comments concerning cases in which the physician has been or is concerned All other like self laudations defy the traditions and lower the tone of any profession and so are intolerable The most worthy and effective advertisement possible, even for a young physician, and especially with his brother physicians, is the establishment of a well merited reputation for professional abili ty and fidelity This cannot be forced, but must be the outcome of character and conduct publication or circulation of ordinary simple business cards, being a matter of personal taste or local custom, and sometimes of convenience is not per se improper. As implied, it is unprofes sional to disregard local customs and offend rec ognized ideals in publishing or circulating such cards

"It is unprofessional to promise radical cures to boast of cures and secret methods of treatment or remedies to exhibit cirtificates of skill or of success in the treatment of diseases, or to employ any methods to gain the attention of the public for the purpose of obtaining patients

Ten years ago, or even five years the term

"Antiquated" might have been applied to the interpretation of these two sections as forbidding a doctor to sign his name to an article on public health; but now county medical societies throughout the land are urged to adopt programs of health education; and the lecturers, writers and promoters receive the widest publicity in the newspapers. But physicians everywhere condemn a doctor when he seeks publicity for the sake of himself or a business concern.

The question of secret remedies was possibly involved in the newspaper comments on the ethi-

cal codes.

Section 33 of the New York Code reads:-"Physicians should not hold, nor receive remuneration from patients for any drug, apparatus, instrument or appliance used in medicine or surgery. They should not receive rebates or commissions from the prescribing of any agent used therapeutically, or from the recommending of patients or the sending of specimens to any laboratory for diagnostic purposes. Physicians should not dispense or promote the use of secret remedies nor assist unqualified persons to evade legal restrictions governing the practice of medicine.'

The code of the American Medical Association. Chapter II, Article 1, Section 6, reads:-

"It is unethical to prescribe or dispense secret medicines or other secret remedial agents, or manufacture or promote their use in any way."

Finally the newspaper articles imply a difference of opinion between physicians. If such a difference arises, Section 24 of the New York Code provides:-

"Diversity of opinion or opposition of interests may sometimes occasion controversy and even contention. Whenever such instances occur and cannot be adjusted, they should be referred for arbitration, preferably to the Board of Censors of the County Medical Society of which such physicians are members."

The Code of the American Medical Association. Chapter II, Article. V, Section 1, reads:-

"Whenever there arises between physicians a grave difference of opinion which cannot be promptly adjusted, the dispute should be referred for arbitration to a committee of impartial physicians, preferably the Board of Censors of a component county society of the American Medical Association."

The observance of these two sections would have prevented the notoriety and ill feeling which always follow newspaper publicity of the differences among medical men. Serious disputes are constantly being settled amicably by friendly conferences within the county societies.

A careful reading of the two codes of ethics will show that their principles are as simple and basic as those of the Ten Commandments, or the Golden Rule. (See page 1314.)

## LOOKING BACKWARD

# This Journal Twenty-five Years Ago

Annual Meeting: The first article in this Journal of November, 1905, was an editorial on the annual meeting, as follows:

"The twenty-second annual meeting of The New York State Medical Association, held October 16-19, 1905, was most successful from every standpoint. No better scientific program was ever presented, as men recognized as authorities in different lines of work were present not only from New York, but from other States, to take part in symposia on hygiene and preventive medicine, on the toxaemia of pregnancy, and on cancer. The attendance was large and the discussion most interesting.

"The meeting of Tuesday, October 17th, was devoted to the question of the amalgamation of the State Association with the State Society. The resolutions approving the agreement made by the

Joint Committee of Conference and heretofore approved by the Medical Society of the State of New York at its annual meeting, January 31. 1905, were carried by the decisive vote of 1,517 ayes, 2 noes, 295 not voting. The reappointment of the old Committee of Conference of the Association was carried by the same vote.

"The large majority in favor of amalgamation clearly shows the desire on the part of the members of the Association to carry out the agreement and foreshadows a united profession.

"Differences of opinion over small and unimportant matters will always arise among large bodies of men, but where all are working for such common causes as the advancement of the science of medicine and the relief of human suffering and the upholding of the honor of the Medical Society of the State of New York, such differences can never be of great importance."

# MEDICAL PROGRESS

Tetany After Exercise - R D Livrence and R A McCance report the case of a girl, agea 16 years and 9 months, who during two and a half years had shown definite signs of tetany about The attacks besix times at irregular intervals gan, as a rule, about ten minutes after games, such as tennis or lacrosse, and lasted half an hour The girl's general health had always been satis-Chemical blood and urine examinations were made before vigorous exercise and during tetany, which was well established fifteen minutes after the exercise was discontinued. The respiration rate remained between 40 and 50 per minute for thirty-two minutes, when the girl became apneic for about two minutes and the spasms rapidly relaxed. At the end of sixty-five minutes she seemed perfectly normal and none the worse It was obvious from the high for the attack normal level of the serum calcium, 117 mg before exercise and 118 mg after, that calcium deficiency was not a causal factor. There was a 'fall in the morganic phosphorus from 36 mg be fore to 2.54 after exercise. A rise was noted in the hydrogen ion concentration of the blood from 7 37 before exercise to 7 42 after These findings conform with those of others, but there was no fall in the alkali reserve, in fact a small rise was observed, from 51 to 55 volumes Usually a fall is obtained, which is explained as part of the buffering adjustment made by the body to maintain the normal hydrogen ion concentration of the The authors ofter no explanation as to why their results should differ in this respect from those of other workers The urmary findings were diagnostic. Ammonia disappeared from the urine, traces of acetone were excreted, and the hydrogen ion concentration changed to the maximum possible alkalimity. The authors conclude that the tetrny was not due to the exercise per se, but to an alkalemia caused by prolonged (presumably functional) over-breathing after the exercise was completed -British Medical Journal, August 16, 1930, n, 3632

Slipshod Surgical Diagnosis—Horace G Wetherill deplores the fact that slipshod surgical diagnosis has been fostered and justified, in recent years, through the ready excuses and easy expedients offered by what is called "an exploratory operation" or worse still, by the employment of that comprehensive "shotgun" diagnosis "a surgical condition". The truth, the painful truth, is that carelessness and negligence are most often responsible for fulure to make proper diagnoses the author's observation and experience lead him to believe that mistakes are made least often by

the surgeon who takes a deep personal interest in his patient and sees him through all the stages of his progress from history taking to recovery Many recent graduates of some of our greatest universities and those who have had training in fine hospitals and big clinics, and who have become accustomed to rely upon the laboratory and the specialty work of others, have been deprived of that broader and better vision which a more intimate contact with the patient and a greater personal responsibility for his welfare bring about The surgeon is responsible for all that has been done before by others and he is responsible for the results One finds in the practice of sur gery today a few, relatively, whose judgment is comparable to, or surpasses, their dexterity, and many whose dexterity surpasses their judgment The first are surgeons, the second are operators Inevitably, therefore, mistaken surgical diagnoses, aside from the inherent difficulties incident to making correct ones, must continue to have a personal factor that cannot be disregarded. When the negligent, and indifferent, the lazy, the incompetent, and the dishonest are also taken into account there is added an important personal element which can be made to explain many failures -New England Journal of Medicine, August 21, 1930, ccm, 8

Internal Derangements of the Knee-Joint -Mi Harry Platt of Manchester, England, says there are still many obscurities attached to the subject of injuries of the semilunar cartilages of the knee Exact knowledge is still lacking regarding the mechanism of production of these injuries, their diagnosis, and the nature of the les on as seen at operation The typical internal semilunar cartilige lesion, he says, is a fracture through the meniscus itself with the line of frac ture occurring in about 93 per cent in the longi tudin il axis, more than half of them being of the "bucket buidle" type In this form the cartilage is split longitudinally but remains attached before and behind. Internal cartilages in which no fracture is demonstrable are frequently encountered in cases in which a positive diagnosis of cartilage mjury has been made. In a few cases hypermotility is present, but as a rule non-fracture lesions do not offer a satisfactory explanation of the mechanics of internal derangement yet excision of the cartilage in such cases is almost invariably followed by a removal of the disability Hypermotility of the external cartilage is a true anatomical entity and is the usual cause of 'trigger knee "-Patrik Haglund Festschrift of the leta Chirurgica Scandinavica Ivii 16, June 18 1930

Spurious Tuberculosis Provoked by the Calmette-Guérin Virus.-Dr. Alexandre Comis has made a number of experiments with this virus, injecting laboratory animals (mostly young ones) with enormous doses. When examined at the expiration of a month, these animals showed lesions of a distinctly tuberculous nature. The lesions were most marked in the lungs, though they were found also less pronounced in the liver and other organs. In the lungs the finds were those of islets of acute tuberculous pneumonia surrounded by a zone of intense, but non-specific inflammation. This first phase was followed, at the end of the fourth month after the inoculation, by a chronic inflammation localized around the blood vessels, surrounding especially the capillaries of the finer bronchioles. There was an hypertrophy of the interstitial pulmonary tissue with an infiltration of lymphocytes and some large mononuclears. The lesions of this stage were confined almost entirely to the region of the bronchi and were of the nature of a chronic tuberculous bronchitis or chronic interstitial pneumonia. The third phase, after the lapse of several months, was marked by complete recovery and a disappearance of all the lesions without any traces whatever pointing to their previous existence. The injection of the B.C.G., therefore, causes at first an acute mild tuberculosis, followed by a benign chronic tuberculosis, and terminating in a complete restitutio ad integrum.—Schweizerische medizinische Wochenschrift, August 16, 1930.

The Obstetrical Aspect of Intracranial Hemorrhage.-Writing in the New England Journal of Medicine, September 11, 1930, cciii, 11, Frederick C. Irving states that during the ten years from 1920 to 1929, inclusive, 13,849 babies were born at the Boston Lying-In Hospital. Of these 99 died of intracranial hemorrhage, an incidence of one in 140 births. During the period from 1909 to 1929, inclusive, there were 182 autopsies in which the heads were examined. Of these 73, or 40 per cent, revealed intracranial hemorrhage as the cause of death. The relative frequency of intracranial hemorrhage following the various types of delivery were as follows: Cesarean section 0.3 per cent, normal delivery 0.4 per cent, low forceps operation 0.5 per cent, high forceps 3.0 per cent, breech extraction 2.6 per cent, and version 1.7 per cent. Numerous intracranial hemorrhages have occurred when labor has progressed normally and no operative interference has been carried out. Failure to establish spontaneous respiration within a reasonable time is strongly suggestive of intracranial hemorrhage. Later evidences of this condition are apathy, refusal to nurse, pallor, and a tense annot be present. Spasm or paralysis may or may Should they exist the diagnosis is practically certain. The prevention of this

condition is by far the most important aspect of the question. The rôle of intrauterine asphyxia as a cause or predetermining factor has never received the attention it deserves. The clinical signs of intrauterine asphyxia are marked and lasting variations in the fetal heart rate and the passage of meconium. Faced with the situation in which the fetus shows evidences of asphyxia before birth, what should the obstetrician do? If after careful and constant observation all evidences of fetal distress disappear, it is the best policy to leave the case to nature with every expectation of a successful outcome. Low forceps on the author's service shows a gratifyingly low incidence of fatalities from intracranial hemorrhage, being only one-tenth of one per cent greater than in normal delivery. The rule is to apply low forceps if the head has been on the perineum for two hours, preceding the operation by a liberal episiotomy. Axis traction rods are always used no matter how low the head is to avoid premature extension, which might cause pressure of the head against the pubic arch with the possibility of tears of the falx or tentorium.

A Preliminary Note on the Detection of an Insular Hormone in the Duodenum.—N. B. Laughton and A. Bruce Macallum, writing in the Canadian Medical Association Journal, September, 1930, xxiii, 3, claim to have produced extracts of duodenal mucosa which when injected into normal rabbits and dogs prior to an injection of 0.5 mg. of glucose per kilogram of body-weight prevented a marked hyperglycemia such as occurred in rabbits not so treated, and also caused the blood sugar to return more rapidly to normal or subnormal levels, thus confirming the work of Heller. In departreatized dogs with marked hyperglycemia these extracts had no influence on the blood sugar, thus the possibility of insulin being present could be discounted. It would appear from these experiments that a substance exists in normal duodenal mucosa which has a specific stimulating influence on the islets of Langerhans, in other words, an insular hormone. This, coupled with Workman's observation that there is marked hypertrophy of the duodenal musoca in cases of diabetes mellitus which come to autopsy, introduces a new factor into the etiology of diabetes. Insular failure may result from excessive stimulation of the islets by the duodenal hormone produced as a result of excessive sugar intake over long periods. Secondly, inflammatory conditions in the duodenum may lead to a deficiency in the hormone, followed by a diminished activity in the islets themselves resulting in a hyperglycemia.

Insulin in the Treatment of Epidemic Encephalitis and Its Parkinsonian or Psychic Sequelæ.—Drs. J. Froment and M. Chambon.

writing in the Journal de Medecine de Lyon of September 5, 1930, state that a physiochinical and biochemical study of Parkinsonism leads to the conclusion that it is directly related to a disturbance of the mechanism which, automatically in man, stabilizes the attitudes and effects the adaptation to varying static conditions. The organism has lost the secret of the economic maintenance of its various attitudes This leads mevitably to a condition of over-fatigue which in its turn gives rise to the Parkinsonian cachexia-an expression of This has led the authors to fatigue acidosis administer insulin and alkalies with, as they claim, remarkable results in the way of a symptomatic Apart from paralysis agitans, the authors have found insulin useful in the relief of certain psychic sequelæ of epidemic encephalitis, namely, light confusional or anxiety states of pseudoneuropathic type, true dream states, having no tendency to spontaneous recession The insulin effect is chiefly on the muscle, assuming that complex reaction in which the oxidation of glucose and the synthesis of glycogen are united one with the other Its happy effects in the treatment of the Parkinsonian and psychic seguelæ of epidemic encephalitis may be ascribed to the re establishment of normal muscular metabolism. the disappearance of lactic acid, the preservation of the proteins, and the recovery of the normal physiological action of the muscular tissue

Sclerosis and Occlusion of the Coronary Arteries -After reviewing the literature and pathology of coronary sclerosis and occlusion Oskar Klotz and Wray Lloyd present a study of 44 cases of coronary disease which have been met in an autopsy service during the past four years Of these cases 26 comprised a group pre senting advanced lesions of coronary sclerosis of a degree sufficiently marked to be classified as In the remaining 18 cases a coronary stenosis thrombus had been found lodged in the coronary artery A comparative study was made of these groups which the authors summarize as follows Coronary disease of the heart usually affects males between the ages of 55 and 60 years, rarely before 30, and is the outcome of an endarteritis associated with atheroma and calcification arteriosclerotic process brings about a stenosis ot the vessel, but the complete occlusion results from thrombosis In no case did thrombosis develop in the absence of sclerotic arteries sclerotic patches are multiple, various branches of the right and left coronary being involved at the same time Stenosing endarteritis in both right and left coronary arteries enhances the myo cardial damage, if only one coronary artery is involved the process may progress to a consider able degree without causing myocardial damage or cardiac manifestations If the stenosis develops slowly, the anastomotic circulation between the right and left coronaries compensates for the vascular derangement, when one coronary alone is seriously affected. Rapidly occluding processes, as in thrombosis, induce more serious myocardial disturbances than the slowly progressive and compensating stenosis associated with chronic endarteritis The stenosing arteriosclerosis appears to have its beginning either in a primary endarteritis or in an intimal degeneration followed by endarteritis The authors were unable to demonstrate a direct relation between rheumatic lesions and coronary sclerosis or be tween syphilis and coronary sclerosis stenoses arising at the aortic entrance to the coronary arteries, resulting from syphilitic aortitis, are not included in this discussion The manner of distribution of the scleroses does not support the contention that the arterial lesions are the result of mechanical stresses due to unique branching of the coronary system The causative factors of endarteritis and atheroma of the coronary arteries are still undetermined - Canadian Medical Association Journal, September, 1930, xxiii, 3

Bacillus Coli Infections -- Writing in the British Medical Journal, September 13, 1930, 11, 3636, K Douglas Wilkinson expresses the opinion that many times the diagnosis of Bacillus coli infection of the urinary tract in children is missed by those who have not pyelitis in mind and fail to make a careful microscopic diagnosis of the urine Recent etiological and pathological studies have raised important questions which will probably modify the prognosis and treatment of these infections Chown and Wilson and Schloss have made observations by which they reach the same conclusions, namely, that pyelitis is a misnomer, that pyuria is due to an interstitial suppurative nephritis, and that careful examination of the kidney pelvis generally fails to show any pyelitis In the types of cases studied there were obviously general blood infections of the most severe nature, and it is doubtful if the B cols appearing in the urine was the original invading organism Wilkinson feels that, while he is not in a position to prove that B. coli infection of the urmary tract is always a pyelitis, he can prove that it is not always a part of a septicemia or evidence of nephritis He thinks the pathologist has experience only of a selected group of patients out of the many who have B coli infections of the urmary tract, namely, the more severe cases which are septicemias Among 117 consecutive unse'ccted cases of pyelitis at the Children's Hos pital in Birmingham there were 9 deaths, a rate of 77 per cent, or 3 per cent in children over two years of age. It is hardly likely that a severe septic condition in children with renal infection, and possibly abscess formation, could have a mortality as low as 3 per cent after the age of two

years, and it is significant that the collection of 78 post-mortem records took no less than twelve years, whereas clinically *B. coli* infections are common. In the treatment the three important requisites are: (1) Rest in bed until the urine is normal, as otherwise relapse generally occurs; (2) plentiful doses of sodium bicarbonate or potassium citrate until the urine is alkaline, then a mixture containing hexamine and acid sodium phosphate, until the urine becomes acid, when the alkaline treatment is resumed; (3) flushing the kidneys by a large fluid intake. Effort should be made to discover any abnormality of the genito-urinary tract and to correct it, if possible.

Appendicitis and Right-Sided Diseases of the Kidney.-H. Walthard estimates that about one-fifth of all right-sided kidney conditions are wrongly diagnosed as appendicitis and subjected to a useless appendectomy, while the real cause of the trouble remains undiscovered and untreated. Such general symptoms as pain, fever, chills, rapid pulse, vomiting, distention, as well as local symptoms-muscular tension, localization and radiation of the pains, and bladder disturbances—are signs more or less common to all the affections that come up for consideration, and may have many different meanings. diagnostic value of pain on pressure over Mc-Burney's point has been overestimated. In the immediate vicinity of this point lies the characteristic point of pressure pain of the ureter where it crosses the linea innominata pelvis. Hence both these points, and Lanz's as well, fall practically together, with the result that renal colic is diagnosed as ileus or appendicitis and operated on as such even by experienced surgeons, or conversely, pain at this point radiating into the thigh and genitals, as it may do in an appendix retrocecally placed, has been mistaken for renal colic and an indicated appendectomy not done. Sometimes an inflamed appendix is itself the cause of nephritis by way of the celiac ganglion, and the renal symptoms have disappeared after its removal. Frequently diagnosis is impossible upon the first examination. Pains in the right side of the abdomen may even come from the left kidney, so complicated is the apparatus of the sympathetic and parasympathetic nervous systems. How now can these affections be clinically differentiated from one another? Examination of the urine is not infallible, since pathologic changes may be present in the urine in appendicitis, while in a tuberculosis kidney the urine may be normal. Unilateral hematuria may occur in appendicitis. Roentgen examination is useful but not absolutely dependable. However, despite the difficulties that admittedly attend the diagnosis of right-sided abdominal conditions, the danger of

confusing appendicitis with renal disease is largely reduced if two principles are rigidly observed: first, that the surgeon who is consulted for pains resembling appendicitis shall always bear in mind the frequency of disease of the urinary organs, and second, that trouble shall be taken to examine the urine with scrupulous care in every such case. With a close inquiry into the history, a thorough examination and a careful weighing of all symptoms, the observance of these two rules will in most cases lead to the right diagnosis and permit recourse to the best form of treatment without too great loss of time.

—Schweizerische medizinische Wochenschrift, September 6, 1930.

The Physiological Basis of the Surgery of the Sympathetic Nervous System.—J. F. Fulton reviews the literature which shows that in the general physiology of the organism the sympathetic system serves primarily to maintain constancy of composition of the fluids of the body. This it achieves through control of the heart, blood-vessels, sweat glands and other vegetative functions. Recent work has failed to confirm the early suspicion that the sympathetic also governed certain phases of muscular contraction. There is no doubt but that ramisection causes transient modification in postural contraction, but no reflex involving the skeletal musculature is ever destroyed as a result of interference with the sympathetic. Consequently, since the alterations in postural reflexes are short-lived, there is no obvious justification physiologically for ramisection in cases of spastic paralysis. Cutting the splanchnic nerve in order to assist in failing kidney, or removal of the abdominal sympathetic chain to alleviate the distressing symptoms of Hirschsprung's disease are amply justified by the results achieved. In addition to its use in these conditions, any pathological process in which healing would be greatly accelerated by an increased blood supply offers an indication for ramisection, especially if the morbid process threatens the existence of an extremity. Thus in Raynaud's disease the advantages of the operation are obvious since the chief symptoms are due to local impairment of the circulation. Also the improvement in certain types of arthritis brought about by ramisection is almost certainly attributable to the resulting hyperemia. It is probable that following thrombosis in an extremity, collateral circulation is established more readily after the vasoconstrictors have been removed than when they are intact. Further studies are desirable on the effects of ramisection or ganglionectomy on various forms of chronic ulceration, as for instance, diabetic gangrene, and in a host of dermatological conditions.—New England Journal of Medicine, September 18, 1930. cciii, 12.

#### EXPERT TESTIMONY THE USE OF MEDICAL TEXTBOOKS

By Lorenz J. Brosnan, Esq. Counsel, Medical Society of the State of New York

The theory of expert testimony in the trial of a lawsuit is based upon the principle that the person offering himself as an expert possesses superior knowledge on a subject as to which the ordinary juror is unversed, and hence in theory the testimony of the so-called expert will be beneficial in assisting the jurors to arrive at a verdict. From a practical point of view, the term "expert" is an exceedingly misleading one. Very often physicians have asked your counsel the very logical question as to why the law should permit a physician, who would not be considered by the medical profession to be an expert on a particular branch of medicine, to express an expert opinion.

For example, in a case which your counsel tried a few months ago involving the question as to whether an x-ray should have been taken in an injury to a patient's eye, the plaintiff called as his expert a physician who on direct-examination testified that his work was principally "referred work" by other physicians, and he then proceeded to give an opinion adverse to the defendant physician. On cross-examination your counsel was able to elicit from this physician that his practice did not relate to the eye, and further that his practice was confined almost entirely to physiotherapy in the out-patient department of one of our hospitals. This, the physician admitted under cross-examination with considerable reluctance, was what he meant when he testified that his work was "referred work." This physician would certainly not be considered by the medical profession to be an expert on the subject-matter upon which he was testifying. Yet he was permitted to give an opinion which carried the case to the jury. Fortunately, the issues were resolved in favor of the defendant physician.

In the trial of a case involving the operation of ethmoidectomy, the plaintiff called as an expert witness a physician who at the time of trial had been in practice about three and one-half years. The qualifications of this physician to express an opinion were challenged by counsel for the defendant, and a preliminary cross-examination was permitted by the court. Upon that cross-examination, this physician who had offered himself as an expert testified:

"Q. Until September, 1923, that is three years, you have operated under your license to practice medicine? A. Yes.

O. And a year and a half of that time you spent as interne in these two hospitals mentioned? A. Yes.

Q. And the last year and a half you have been associated with Dr. . . . . in doing general compensation work? A. Compensation and treatment of injury, in addition to my general practice.

Q. You are not a specialist in eye, ear, nose and throat? A. With the exception-

Q. Yes or not. We will take the exceptions up later. A. No real specialty.

Q. That is a distinct, recognized specialty, isn't it, apart from the medical practitioner? A. Yes.

Q. As a rule the general practitioner does not undertake operations and treatment of the eye, ear, nose and throat? A. He does not.

Q. In this year and a half, Doctor, of your practice most of your practice has been dealing

with injuries suffered by workmen? A. No, sir. Q. In the compensation work? A. That is just part of it.

Q. I beg pardon? A. That is just part of the practice; I should say it is about a sixth.

Q. In addition to that, do you take care of the families of those employees? A. We take care of the employees and treat them gratuitous.

Q. What is the name of this? A. ...... Q. Is that a charitable institution? A. No, sir.

Q. Is that an institution people join and receive general medical treatment? A. No, sir.

Q. What is it? A. There are two large buildings, which are worked on a co-operative.plan, and the employees of those buildings have contracted with Dr. ..... to render all necessary medical and surgical treatment to all the em-

ployees; there are twenty thousand employees in this building, and that is done gratuitous. Q. That is done under the General Compensation Act? A. No. sir, it is done under private contract with the employees.

Q. You have not operated any of these ethmoidal operations yourself? A. I have assisted.

Q. Have you operated them? A. Not myself. Q. Never have operated one yourself. A. No, sir."

After such cross-examination, the defendant's counsel again challenged the qualifications of this physician to express an opinion, but the court ruled that this doctor could express an opinion regarding the operation of ethmoidectomy but that the weight of his opinion was for the jury. After the physician had expressed an adverse

N. Y. State J. M. November 1, 1930 LEGAL

opinion, he was further cross-examined. Among

other things he testified:

"Q. Now, Doctor, I just want to go back. \* \*\*\* There are a few questions I would like to ask you about this experience you have had. As I understand it, you have had about thirty thousand cases in the last twenty months, is that what you say? A. Yes.

Q. You mean you personally had charge of and treated thirty thousand cases in the last twenty months? A. I personally instructed and

treated in the thirty thousand cases.

Q. Did you personally see the thirty thousand cases? A. Yes sir.

Q. In the last twenty months? A. Yes sir. O. And that is about six hundred days, isn't it, thirty to the month and twenty months, would be about six hundred days? A. Yes sir.

Q. Thirty thousand cases would give you about five hundred cases a day? A. I think there is

a mistake in figuring, counsellor?

- Q. Fifty cases a day? A. I have had one hundred cases a day, but they are variable, you
- Q. Do you work all day? A. I work from eight o'clock in the morning until one o'clock, at noon.
  - Q. That is five hours? A. Yes. Q. Ten cases an hour? A. Yes.

Q. Ten cases an hour would be a case every six minutes, would it? A. Yes.

Q: So you see and consider and treat a case

every six minutes? A. Yes.

Q. And you have done that twenty months?

Yes, that is by applied figures.

- Q. And you see and consider all these cases, you say, now? A. May I exemplify your question?
- Q. No, can you answer it? A. No, I can't answer it, it is too indefinite.
- Q. These cases you handle, those thirty thousand cases, do they cover all fields of medicine? A. All fields of medicine and surgery, the medical effects of surgery.

Q. Do they include major operations? A. Just

the medical effect of major operations.

- Q. Well then, they don't include the performance of major operations? A. No.
- Q. Do they include ethmoidectomy? A. No,
- Q. Do they include diagnosis? A. Only medical treatment.
- Q. That is the giving of medical cases? A. Yes.
- Q. Not the removal of bones, curetting of ethmoidal cells? A. No, sir.
- Q. Nor the removal of turbinates? A. No, sir."

The physician further testified:

Q. Have you testified often in suits that have followed operations? A. I have.

Q. Compensation suits? A. In regular suits.

Q. Suits for compensation. To give expert testimony? A. Yes.

O. In the last six months, how frequently have you been going to court as such expert? A. I haven't been there for the last four or five months, say.

Q. Do you regard that as a part of your busi-

Q. In accident cases and cases of that kind? A. Yes.

Q. Before you go in, as you do here as an expert, you first try to find out what plaintiff is trying to prove, don't you? A. Yes.

Q. And then you see how much help you can

give him, don't you? A. Yes.

Q. And how much you can support what his contention is? A. Yes, sir.

Q. And that is part of the business in the deal, isn't it? A. Part of my work is expert testimony.

Q. Well, you are a professional testifier, aren't you, Doctor? A. No, sir.

Q. Well, you did it for pay right along? A. Yes.

A. And it is according to how frequently people will hire you? A. Yes.

Q. The more people hire you, the better you like it? A. Yes, sir.

Q. And the more they pay you, the better it

pleases you? A. Absolutely.

Q. Well, don't you call that a professional testifier? A. No, sir, it is all in connection with my general practice.

Q. Well, you are a professional testifier as a

side line then, aren't you? A. Yes, sir.

Q. You never operated a major operation on the abdomen, have you? A. Not myself.

- Q. But you would assume to undertake, wouldn't you, tomorrow morning, to go into court before a jury and testify as an expert as to how an abdominal operation should be performed? A. If the case were just, I would.
- Q. Let us assume the case was just, in your opinion; you would do that? A. Yes, sir.

Q. You have never performed an operation on

the brain, have you? A. No, sir.

Q. You would go into court and before a jury and testify on operation of the brain, wouldn't you, if you were hired? A. If the case were just.

Q. And if you were hired? A. If the case

were just and I were hired, I would.

Q. It is not a question of your honesty, Doctor, it is a question of your attitude concerning testifying on matters in regard to which you state you have not had personal experience. Have you ever taken out, enucleated an eye? A. No, sir."

Instances could be multiplied from your counsel's personal experience in malpractice actions covering more than a decade, but it is sufficient to point out that an expert, as the medical profession properly views that term, is entirely different from the point of view taken by the law.

In connection with the subject of expert testimony, there arises the question regarding the use of medical textbooks. Logically, it would seem that jurors might be assisted to considerable extent if they were permitted to examine the works of standard authors on the subject-matter of the case in which they are sitting, but this the law does not permit. In a malpractice action, neither the plaintiff's case nor the defendant's case may be supported by the introduction of medical textbooks claimed by either side to support their contention. In the cross-examination of any physician called by either side, however, the attention of such witness may be called to certain standard medical works and, if admitted by the witness to be a standard authoritative work, he may then be examined with reference to statements or opinions expressed in the textbook which contradict or are at variance with the opinion expressed by the witness. The principle has been judicially stated as follows:

"\* \* \* if the witness admitted that text writers of acknowledged authority had expressed opinions contrary to that one which he gave in regard to the matter under examination, that might go to detract from the weight to be given to such testimony. Therefore, it has been the custom, in this State at least, to call the attention of an expert witness, upon cross-examination, to books upon the subject, and ask whether or not authors whom he admitted to be good authority had not expressed opinions different from that which was given by him upon the stand. The reference to books in such cases is not made for the purpose of making the statements in the books evidence before a jury, but solely for the purpose of ascertaining the weight to be given to the testimony of the witness. The extent to which such examinations may go is very largely in the discretion of the court. It has been usual to permit questions of that kind to be asked in this State, and we are not aware of any well-founded objection

#### CLAIMED NEGLIGENCE CAUSING NEEDLE BREAK

In this case the patient complained of pain in her left lower chest, and for about two weeks she suffered from fever and considerable pain in her left side radiating from the shoulder to the flank.

The doctor who had been treating her made a diagnosis of pleurisy with effusion and wishing to confirm this diagnosis by a tap, he called upon the defendant-doctor to aspirate the patient's The defendant was not a specialist but was a general practitioner who had a long experience in surgical work. A specialist was not called by reason of the limited means of the patient.

The defendant doctor selected and tested two aspirating syringes with three sized needles for each and also a 2 cc. hypo syringe with two needles and proceeded to the patient's home. All precautions were taken to render the instruments sterile directly before the treatment. The defendant upon examination of the patient found convincing evidences of pleurisy with effusion and found the skin around the entire left chest tender from counterirritants that had been applied,

The area was prepared and the point for hypoinjection was sprayed with ethyl chloride. After the area was desensitized with cocain the defendant selected a needle, tested it, and then inserted the needle with the point turned slightly upward, but the result was a dry tap. He then withdrew the needle and re-inserted it with the point turned downward and on withdrawing the barrel a yellow fluid was drained into the aspirating apparatus.

When the barrel was about half full the patient jerked her body away sharply and the needle snapped at the hilt. The defendant attempted to find the needle but was unsuccessful. The patient was removed to a nearby hospital and put to bed. The following day an x-ray picture was taken which showed the presence of the needle in the patient's chest,

One of the surgeons connected with said hospital applied a local anæsthetic and incised over the spot where the needle was imbedded, and after a little work succeeded in getting it outin toto. The surgeon observed from the position that it was in that it had broken off at the hub and that the break was due to an upward movement of the ribs, an indication that the needle had broken due to the patient's moving her position rather than any unskillfulness on the part of the defendant.

After the removal of the needle, the patient was left in charge of the defendant and her recovery was from that point uneventful.

Suit was instituted against the defendant alleging large damages due to the needle break and charging the defendant with gross negligence in his treatment of the case. The action was duly brought on for trial before a judge and jury and after the plaintiff's witnesses had testified. defendant's attorney moved to dismiss the complaint for failure to make out a cause of action for negligence or any other cause of action. Said motion was granted by the judge thereby terminating the case in favor of the defendant.

# NEWS NOTES

# COMMITTEES ON PUBLIC RELATIONS

A meeting of the Committee on Public Relations of the Medical Society of the State of New York was held on October 9, 1930, in the New York Academy of Medicine. Its special business was the consideration of the rules and standing orders for the conduct of County Hospitals receiving aid from the State. The managers of the hospitals of Wyoming and Lewis Counties,—the only two now entitled to State aid,—had sent a tentative set of regulations which will be submitted to the State Commissioner of Health, Dr. Thomas Parran, Jr., for approval as the condition for the grant of State aid to the hospitals. Dr. Parran had asked the advice and counsel of the Committee on Public Relations; and in response the committee gave serious consideration to all points of the hospital management, for whatever rules are adopted will be precedents for all future ones.

The first principle on which the Committee insisted was that such hospitals should be open to all physicians of its county. There was also adopted the principles of complete medical histories and regular monthly conferences of the doctors composing the staff.

The complete set of rules would fill ten pages of the Journal; the standing orders are therefore omitted from this report.

#### GENERAL RULES

1. All duly registered physicians of the County may be members of the staff. From their number they shall nominate for election by the Board of Managers a medical board of five members. The medical board shall make recommendations to the Board of Managers for appointments for the necessary, efficient and adequate surgical, medical and special services of the hospital; shall amplify the rules and regulations for the conduct of the professional work of the hospital; and shall formulate whatever By-Laws seem necessary for the efficient conduct of its (medical board's) business. Before such rules, regulations and By-Laws shall become operative, they must be approved by the Board of Managers.

2. All surgical and special services rendered in a general hospital receiving State and County funds, shall be performed by physicians, resident or non-resident, who are qualified to undertake such activities, and who have the approval of the medical board.

3. All surgeons operating on their own private patients shall be responsible for the after-treatment. This also calls for a personal, daily visit used patients for the first week following operation. The above rule is made for the purpose of protecting patients.

4. Every physician entering a case in the hospital shall send a written tentative diagnosis, or a written history

of the case.
5. Chronic cases shall not remain in the hospital longer diagnosis is made, unless special than two weeks after a diagnosis is made, unless special provision is made by the physician-in-charge.

6. There shall be no operations scheduled for Saturday afternoon or Sunday.

7. All major operations shall be performed in the morning, except in emergencies.

8. All requests for operation must be made to the superintendent at least 24 hours before the hour of operation, except in emergencies.

9. All operations must be started on schedule time, or the following operations shall take precedence.

10. The staff will not be permitted to take instruments or apparatus from the hospital.

11. All discharges are to be signed by the physicians in attendance.

12. All orders for patients must be signed by their physicians in the order book. Nurses will not be held responsible for violation of this rule.

13. Medical rounds shall be made every day at 10 A.M.

with the nurse in charge of the ward.

14. Visitors to patients shall first obtain permission to enter the ward or room from the office, and shall not visit or come in contact with any other patient than the one for which permission is given.

15. Patients and their friends are reminded that this is a hospital where many sick people are congregated, and are expected to refrain from loud talking, laughing, or making noise which will disturb others.

16. The medical board shall recommend to the Board of Managers that a committee of one be appointed monthly by the president of the County Medical Society to serve for one month in making weekly inspections of the hospital; also the general conduct of the nurses while on duty during this inspection. The committee is to make a written report of findings and recommendations to the Board of Managers.

#### RULES FOR THE HOUSE STAFF

1. They shall see that the histories of all patients are complete on the day of discharge, and notify the Medical Board of any violation of Rule 4 of the Staff Rules

and Regulations.
2. They shall maintain professional secrecy at all times concerning any cases that come under their ob-

servation in the hospital.

3. They shall not discharge any patient without the approval of the attending physician or surgeon.

4. They shall not make any pelvic examination of any

female patient except in the presence of a nurse.

5. Morning rounds shall be made at 9 A.M. and evening rounds at 7.30 P.M.; and visits to patients at other hours of the day or night as may be necessary. And they shall at all times promptly visit any patient when

informed that his presence is needed.
6. The Chief of Staff or Associates shall report promptly to the Medical Board any serious breach of discipline, any accident occurring on the premises, or anything coming under their notice that would be likely to involve the hospital in legal action or otherwise reflect on the

good name of the hospital.

It shall be plainly understood that the government and discipline of the hospital are in no degree intrusted to the attending physician. Except in an emergency he shall give no orders, medical or otherwise, to private patients without the knowledge and consent of the pa-

tient's physician.
7. These rules and regulations may be amended or added to at any regular meeting of the staff, subject to approval by the Board of Managers.

# STAFF RULES AND REGULATIONS

In order to establish and maintain a high standard of

scientific work and to conform to the requirements of the Committee of Hospital Standardization and Classification, the physicians and surgeons practicing in the hospital shall organize as a staff and recommend for ratification by the Board of Managers the following

1 The hospital shall keep in a systematic manner case records of all patients treated in the hospital, together with a convenient summary of each case, and these rec ords shall be utilized in analyses to ascertain the effi

ciency of medical and surgical work done in the hospital The case records of the hospital shall contain the following data for each patient treated Identification of the patient by name or number, name of physician or surgeon responsible for the case, personal history of patient relevant to complaint, diagnosis on which treatment was based, laboratory a ray and physical findings important points of operation or of treatment, postoperative diagnosis, complications of convalescence, followup or progress notes, and, in case of death, autopsy findings when available

3 It shall be the duty of the historian to record the

necessary data on forms prescribed by the Medical Board 4 The data may be recorded by the attending physician or surgeon, or by an interne, or by the historian, but refusal or neglect on the part of the attending man to furnish the record and to give the necessary aid to the historian in the recording of the data shall terminate his privilege of treating cases in the hospital

5 It shall be the duty of the historian to make out a summary card for each patient, together with the followup record It shall be her duty to make statistical com-pilations of the results obtained for analysis and review

by the staff of the hospital

6 Medical histories must be taken and physical exam mations made not later than the first twenty-four (24) hours after the patient is admitted to the hospital

7 In all surgical cases the surgeon shall, previous to operation, record the diagnosis on which his treatment is based. This diagnosis shall be posted on the board

where operations are listed

8 In surgical cases the essential history pertaining to the condition for which the patient is to be operated upon together with the record of the physical examination, must be furnished to the hospital before the patient is operated upon except that in emergency cases this history may be dictated by the surgeon before or during the operation In non-emergency operative cases the history and record of the physical examination shall be delivered to the hospital by the surgeon, or ample time shall be allowed for taking the history of surgical pa tients after the patient reaches the hospital

9 During or at the close of each operation a descrip tion of the pathological findings and of the operation shall be recorded, together with a diagnosis based on the gross pathology. This shall be dictated by the surgeon

himself

10 The staff shall hold a conference at least once a month for the purpose of scientific discussion revision of summary cirds and for the consideration of matters concerning the welfare of the hospital. Any member who shall absent himself from three consecutive, or a sum total of five meetings in any one year, shall

thereby be eliminated automatically from the staff 11 A roll of attendance and a record of the transactions of every staff conference shall be kept by the

secretary and referred to the superintendent to be submitted by him as a part of his monthly report to the Board of Managers

12 All members, whether attached to the Consulting, Regular or Associate Staff, are required to register their time of entering and leaving the building, in a book provided for that purpose in the staff room, which signatures must be written in ink.

13 We, the physicians, whose names are herewith subscribed, agree to abide by the rules and regulations herein

set forth

Members of the staff agree to the following declara tion

I hereby declare that during such time as I consider myself eligible to the privileges of the hospital I shall conform to the principle not to engage in the practice of the division of fees under any guise whatever this principle I understand that I am not to collect fees for others referring patients to me, not to permit others to collect fees for me, not to make joint fees with phy sicians or surgeons referring patients to me for opera tions or consultations, nor knowingly to permit any agent or associate of mine to do so

M D Dated Signed

#### By-LAWS

1 Fhe staff shall, at its annual meeting, elect a President, Vice President, Secretary and Treasurer 2 It shall be the duty of the President of the staff to

preside at all meetings of the staff and in his absence

the Vice-President shall preside

3 Any member of the staff of the hospital by resolu tion duly proposed at a regular or special meeting thereof and adopted at the next following meeting by a majority of those present, may be asked to resign from the staff within a time set forth in the resolution, or by resolu tion similarly proposed and adopted a member of the staff may be expelled forthwith from such membership In the event of such expulsion or of such request to resign whether or not the said request shall have been complied with within the time mentioned in said request the said member so expelled or requested to resign shall cease to be a member of the said staff and to have any of the privileges of membership

Three members of the staff can request the calling of a special meeting by requesting the same in writing to the President of the staff who, upon receipt of such request, shall require the Secretary to issue the call for such special meeting to each member of the staff

5 All staff rules and regulations must be carefully studied and complied with by all members of the staff of the hospital and all members of the staff are required to signify their acceptance by signing an agreement to abide by the rules and regulations of the hospital

6 Any registered dentist in New York State who is n member of the State Society in good standing shall be a member of the Consulting Staff and allowed to practice his profession, except to perform major oral surgery

#### FIRST DISTRICT BRANCH

The twenty-fourth annual meeting of the First District Branch of the Medical Society of the State of New York was held on Tuesday, October 7, 1930, in the building of the New York Academy of Medicine at 2 East 103rd Street, New York City The meeting was begun with a buffet luncheon. The scientific session was opened at two o'clock and the following scientific program was carried out

1 "Symptomatology and Treatment of Drabetes," Elliott P Josin M D, Roston Discussion opened by Henry R Geyelin, M D, New York

2. "Toxic Goitre," Frank H. Lahey, M.D., Boston. Discussion opened by Charles G. Heyd,

M.D., New York.

3. "Essentials in Treatment of Fractures," John J. Moorhead, M.D., New York, N. Y. Discussion opened by James E. Sadlier, M.D., Poughkeepsie, and George A. Leitner, M.D., Piermont.

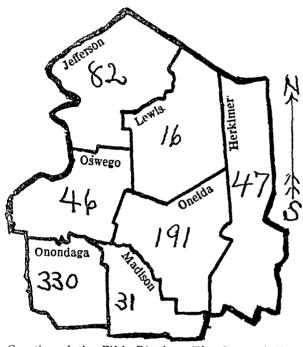

Dr. William H. Ross, President of the Medical Society of the State of New York, gave a half hour address in which he outlined the changing order of medical practice as the result of newer social trends. He emphasized the necessity that practising physicians should not leave the leadership in the newer medical work to doctors employed by the State, social organizations, and industrial corporations, but should make provision for practising preventive medicine as a part of their private practice.

The meeting was probably the best attended of any District Branch ever held, over five hundred physicians being present and filling the large as-

sembly hall to overflowing.

# FIFTH DISTRICT BRANCH

The twenty-fourth annual meeting of the Fifth District Branch of the Medical Society of the

Counties of the Fifth District. The figures indicate the number of members of the County Medical Society.

State of New York was held on Tuesday, September 30, 1930, in the Masonic Temple, in Little Falls, Herkimer County, with 109 physicians registered.

Luncheon was served at 1 P. M. at the Hotel Snyder, by invitation of the Medical Society of the County of Herkimer.

The following printed program was carried

Meeting called to Order by the President, Augustus B. Santry, M.D., Little Falls.

Address of Welcome by the Mayor, John M.

Tanzer, D.D.S., Little Falls.

"Some of the Newer Anasthetics," George S. Eveleth, M.D., Little Falls. Discussion by Drs. Victers, Gardner, Sears, Wetherell and Lahey. "Goitre," Frank H. Lahey, M.D., Boston,

Mass.: Discussion by Drs. Tinker and Groat.

"Medical Shock," Danna W. Atchley, M.D.,

New York, Discussion by Dr. Johnson.

"Treatment of Varicose Veins," John Sutton, Jr., M.D., New York. Discussion by Drs. Barnes and Diss.

"The New Public Welfare Law," Hon. Richard W. Wallace, N. Y. State. Department of Social Welfare, Albany.

In addition, Dr. William H. Ross, President of the Medical Society of the State of New York, addressed the Branch on the objects and aims of the State Society, and commented on the civic activities conducted by each county society in the District.

# THE EIGHTH DISTRICT BRANCH

The Eighth District Branch of the Medical Society of the State of New York celebrated its Twenty-fifth Annual Meeting, on October 2, at the J. N. Adam Memorial Hospital, in Perrysburg, with an excellent program and a large delegation from Cattaraugus, Chautauqua, Erie, Genesee, Niagara, Orleans, Allegany, and Wyoming Counties. Dr. W. Ross Thomson, of Warsaw, presided.

The host for the meeting was Dr. Horace LoGrasso, superintendent of the J. N. Adam Hospital, who showed the visitors through this magnificent tuberculosis sanatorium, arranged for a bountiful luncheon, and read a paper at the morning session on "Value of Light in the Treatment of Tuberculosis."

The delegates saw in the Perrysburg institution, the American counterpart of the Rollier project in Switzerland for the treatment of tuberculosis with light, although Perrysburg is many strides ahead because of its research work in this field.

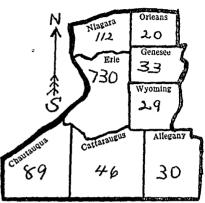

The hospital owes its origin to the late Dr John H Pryor, whose vision tenacity and courage resulted also in the establishment of the State Hospital for Incipient Tuberculosis at Ray Brook It is significant of the man that when the authorities sought to name the Buffalo Hospital after him, he said 'The selection of a name is a trifling matter. The imperative, press ing demand is for the rapid construction of a proper hospital for the neglected victims of a preventable disease who are compelled to suffer and endure hardship without adequate care or relief in the home, while others are infected, and the ghastly, disgraceful carmyal of unnecessary deaths flourish unabated There must be condemnation of apathy and stupidity in dealing with an unfortunte class and a strenuous appeal to hasten the day when injustice to the sick poor, and blind disregard to public health requirements shall cease to be a blot of shame upon the repu tation of this city"

The hospital was named after the Hon J N Adam, then Mayor of Buffalo, who donated 293 acres for the original site in the Perrysburg hills, 37 miles from the city It is a municipal institution for favorable cases of tuberculosis and all types of the extra pulmonary form of the dis-The project was started in 1909 and opened in 1912 The capacity is now 500 patients-394 adults and 106 children. The propcrty today consists of 680 acres, with sufficient farm lands to supply local needs and to support a herd of 60 Holstein cows Every attention is given to the needs of patients, not only for medical treatment, but in various entertainments to break the monotony of sanatorium life is a school for children employing five teachers for grade and commercial subjects

It was a happy thought to give the members of the Lighth District Branch the chance to see this institution at first hand

Following Dr LoGrasso's paper, there was discussion by Dr Brian O'Brien, former physicist at the hospital whose research into light

therapy was financed in part by the Buffalo Tuberculosis Association Dr W H Ross, President of the State Society, addressed the afternoon session on medical leadership in public health work Dr Johnson, President elect, spoke

Counties of the Eighth District The figures indicate the number of members of the County Medical Society

briefly Dr Card, Speaker of the House of Delegates, told members of the State Society's meapensive plan of liability insurance. Papers were read and discussed as follows

"Epilepsies—Etiology and Diagnosis, William T Shanahan, MD, Sonyea, discussion, Edward A Sharp, MD, Buffalo

"The Salient Features of Surgical Diagnosis in Conditions of the Abdomen," illustrated with lantern slides, Gordon Heyd, M D, New York City Discussion, George W Cottis, M D, Jamestown, and Marshall Clinton, M D, Buffalo (It is expected that these papers will be published in the Journal.—The Editor)

W WARREN BRITT, Secretary

#### ONEIDA COUNTY, CIRCULAR LETTERS OF INFORMATION

The Medical Society of prepare the physicians to vo on October fourteenth. Tou

Com 1 ittee -- Pritor s Note

sen ling out a series of circular letters in order to department which was to come before the Society Farrell of Rome, Chairman of the Public Relations

Letter No 1 gather

Utica, N Y, Sept 22, 1930

Dear Doctor

We have been instructed by the Comitia Minora, to send out a series of letters to the members of the County Society, dealing with matters which are under consideration by the Public Health Committee

At every Medical Meeting, or wherever doctors

gather together, the discussion sooner or later gets around to Economic Problems. A great many complaints are registered but few solutions of the doctor's dilemma is offered. Do we get to the underlying social trends and needs? Economics is a Community problem. So is Public Health. Therefore we must not be surprised if lay organizations show an interest in the solution of conditions which the Medical Profession has heretofore thought of is peculiarly its own.

There are two hundred Foundations in the United States, each with an endowment of Ten Million Dollars studying Health and Medical questions. They are well advertised in the Press and the public is becoming restless at the delay in the production of results. In addition, there are a great many lay organizations in every community, doing various forms of Social Service work, each of which has some relation to the Public Health Problem.

Moreover, the Daily Press, the Weekly and Monthly Periodicals, are crowded with medical topics, many of which are advocating some form or other of Socialistic or Communistic soluton of

medical problems.

The officers and leaders of the State Society, are alive to all this seething unrest. They are trying to find a solution which will enable the Medical Profession to regain and retain its leadership in all matters pertaining to the health of the Community. They would welcome any constructive suggestions that any of the constituent County Societies might offer. What we ask of you at this time is that you should devote some of your time to the thoughtful reading of articles in your Medical and Lay Journals, which are discussing Public Health Problem.

## Letter No. 2

September 29, 1930.

Dear Doctor:

The question of a County Health Department will come up for discussion at the October meeting of our County Society. In order that all may be prepared to intelligently discuss and vote on this proposition, we are going to summarize what has come to us in various leaflets and bulletins.

#### I. What It Is.

A COUNTY HEALTH DEPARTMENT is an official branch of the county government charged with the duty and responsibility of protecting public health and preventing disease. It is expected to bring to a county more complete utilization of present day knowledge about public health, thereby lessening the amount of disease and sickness and adding more healthful years to the average life.

Its establishment is recommended by the United States Public Health Service, State Department of Health, State Sanitary Officers' Association, State Medical Society and the Charities' Aid

Association.

The County Health Department proceeds on much the same basis as any well organized City Health Department. It is expected to promote Diagnostic Medical Service in Maternity, Infancy and Child Hygiene, Tuberculosis, Social and Mental Hygiene, Communicable Disease Control, Public Health Nursing Service, Laboratory Work, Health Information, Sanitation and Statistics.

# II. Why It is Needed.

To provide all of these services in all towns, villages and cities would be impossible for the State itself. On the other hand, the individual towns, villages and small cities are said to be too small to provide all of these services in their own areas.

The County is therefore selected as a unit best fitted by population, taxable resources and by actual experience over a period of years, to provide the things needed for an up-to-date health program.

gram.

# III. Where It Is Used.

The County Health Department plan is a development of the last decade. In 1914 there were only three such organizations in the entire United States. Now, there are approximately 350 County Health Departments operating in 32 States. Cattaraugus County is the first county in New York State to adopt the plan. Suffolk County, Westchester County and Cortland County have since established County Health Departments.

## Letter No. 3

October 6 1930.

Dear Doctor:

Among the objectives and responsibilities of the County Health Officer would be the following:

#### IV. What It Will Do.

1. To stimulate the control and prevention of tuberculosis by means of clinics for examination of children and adults, x-ray service, nursing information and sanatorium treatment.

2. To offer laboratory facilities to physicians in the diagnosis and study of disease and to test

water and milk supplies.

3. To control epidemics and contagious diseases.

4. To employ public health nurses and provide local health stations in the County.

5. To cooperate with the physicians of the County and to provide for the protection of

maternity, infancy and early childhood.

- 6. To cooperate with local Boards of Education in the promotion of school hygiene, including physical examinations of pupils and to cooperate with the family physician and dentist in correcting the defects discovered.
- 7. To examine milk and water supplies and supervise methods of disposing of sewage and garbage.

8. To undertake campaigns for accident pre-

vention.

9. To encourage efforts for the reduction of venereal diseases.

10. To encourage periodic health examinations for everyone.

11. To keep accurate and adequate records of births, deaths, sickness and other activities of the County Health Department.

#### V. Duties of a County Health Officer.

The County Health Officer is the executive director of the Health Department. He and his assistants are the connecting links in the promotion of a unified and efficient program throughout the County. The Health Officer consults and cooperates with the medical profession; he stimulates and encourages the valuable assistance of groups of laymen; and he studies the health problems of the County and suggests plans for their solution.

#### His Is a Full-Time Job.

He must be a physician of approved training, experience and qualifications. Certain duties covering the entire County such as inspection of dairies and milk, of camps, of institutions and of water are to be performed by the County Health Officer or his assistants. The development and direction of a public health nursing program would be his responsibility.

The local Health Officer would be expected to assist the County Health Officer so far as practical in his own district.

#### Letter No. 4

October 11, 1930.

Dear Doctor:

VI. How a Department May Be Created.

A County Department of Health is responsible to the people through a County Board of Health, appointed by the Board of Supervisors, consisting of seven members, one of whom shall be a supervisor, and two physicians who may be named from a list suggested by the County Medical Society. The full-time County Health Officer is appointed by the Board of Health.

He may be assisted by such deputies as are needed, by a sanitary inspector, and by two or more public health nurses. Local Health Officers are eligible for appointment as deputies.

The procedure is essentially as follows:

1. The adoption, by the County Board of Supervisors, of a resolution to establish a general health district and describing its bounds.

A meeting of the Oneida County Medical Society was held in Rome, N. Y., on October 14, 1930, with fifty members present. The principal topic of discussion was the proposed County Health Department.

The argument in favor of the department was presented by Dr. Arthur T. Davis, Health Commissioner of the Suffolk County Health Department, which was established two years ago as the result of the spontaneous action of the Suffolk County Medical Society, and which has func-

2. If it is desired to include within the district a city of third class, or a part thereof, it should be covered in the resolution subject to the consent of the proper city officials, after which the proposition to have it so included, should be submitted to the Mayor and Common Council of the city. Its inclusion will be legal only when the Common Council has adopted a resolution consenting to such inclusion and the Mayor has approved it.

3. A copy of the resolution should be submitted to the State Commissioner of Health with a request for the approval of the establishment of a health district, and as a basis for later request for

State Aid.

4. On receiving such approval, the Board of Supervisors should appoint a County Board of Health.

5. The Board of Health should meet for organization and elect one of its own members as president. Unless a budget for the first year was prepared and an appropriation voted by the Board of Supervisors, the Board of Health should prepare a budget covering salaries and expenses.

6. When provision has been made for salaries and expenses, the Board of Health should proceed to the appointment of a Health Officer, who shall act as Secretary to the Board of Health. The appointment must be made from a civil service eligible list, if available.

7. The Board of Health and the Health Officer should prepare a program to include a tentative understanding as to the relations between the local Boards of Health and the County Board and as to the duties and functions to be performed by the District Health Officer and the local Health Officers, who are continued as deputies.

#### VII. What It Will Cost.

Since State Aid is available to reimburse any County to the extent of one-half of its expenditure for approved public health work, a County Health Department may be established at one-half the estimated cost. A budget of \$24,000 annually is considered reasonably adequate in the average County.

tioned to the great satisfaction of the physicians and the officials of the County.

The argument against the County Health Department was presented by Dr. R. B. Morris, of Olean, Secretary of the Cattaraugus County Medical Society. Dr. Morris said that the health department of Cattaraugus County had been "given" by the Managers of the Milbank Fund, and that the physicians of the County had little or no part in its establishment or maintenance.

The society voted against the proposed county

health department.

#### BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on October 15, 1930, was called to order at 9 P M, the retiring President. Dr Aranow, in the Chair

Dr Aranow thanked the members for their co operation during his administration. He appealed to the membership for its cooperation and support of the incoming officers In turning over the gavel to Dr Gettinger, he expressed his best wishes for a very successful Administration

Dr Gettinger thereupon took the Chair and ad

dressed the Society as follows

"I hope to reach out for much constructive work, for at no time was the medical profession in such a dilenima, at no time did the medical profession face the problems that it faces today These conomic problems do not only involve the integrity, the initiative, the self determination and medical independence, but they touch the vitals of the profession namely, the stability of its exist-And while I feel that we cannot launch a solution to these problems, I believe that by education, by propaganda, by having an under standing with the public and the commonwealth, we can reach some agreement

'In conclusion, I wish to thank, in the name of the Bronx County Medical Society, the last Administration, particularly its President, Dr Aranow, who, unbeknown to you, has worked very hard has constantly watched medical legislation and he has deserved the gratitude not only of the profession in the Bronx, but of the entire profession of the State for his active, sincere and ardent work, and I hope that the men in the profession will appreciate this as much as he deserves

Drs Edward Feder, Reuben Gilbert and Louis M Palermo were elected to membership

Dr Magid reported on the plans of the Committee on Medical Economics for the coming year

The recommendation of the Comitia Minora, that four members of the Society be appointed to act as representatives to the Allied Professional Council of the Bronx, was approved

The following Resolutions were introduced and

carried by a rising vote

'Whereas The Bronx County Medical Society having sustained a severe loss in the death of its honored associate Henry S Beers, MD

Resolved That the Bronx County Medical Society record the sense of its loss in the death of Dr Beers and that a minute thereof be placed on the records of the Society and be it

Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member

The Secretary read the following Resolution adopted at the Conference of County Secretarics and endorsed by the Executive Committee of the Council of the Medical Society of the State of New York

The County Secretaries having learned through the press that the Commissioner of Health of New York City in addresses and interviews has advised the Midi cal Profession to abandon what he calls the Code of Ethics, to publicly advertise and to open one price chinics take exception to and condemn this attitude of the Commissioner as subversive of the welfare of the practicing physician and detrimental to the public health 'They fully realize that men adopting this method

would do so not from motives of altruism or philan thropy, but solely with an idea of personal aggrandize ment, and that the commercial the unscrupulous and the incompetent would foist themselves upon the public at large as being endorsed by the Department of Health and the city authorities

'Turthermore those registered physicians of the pres ent advertising type against whom even the Department of Health has been endeavoring to protect the public would take advantage of this seeming endorsement and

entrench themselves more firmly

The Conference of Secretaries believes that the Prin ciples of Professional Conduct are necessary, beneficial just and equitable and calls upon the Executive Com mittee of the State Society rigidly to enforce its provisions and to confer with the State Grievance Committee regarding the possibility of any violation of the Medical Practice Act'

Following discussion it was moved and carried that the Bronx County Medical Society endorse this Resolution

The Program of the evening then proceeded as follows

#### Addresses

1 "Mass Production and Wholesale Distribution in Medicine" Inaugural Address, Joseph H Gettinger, President, Bronx County Medical Society

"Thoughts on Medical Economics," George Chandler, Chairman, State Committee on Medical Economics

I J LANDSWIN, Secretary

## GREENE COUNTY

The annual meeting of the Greene County Medical Society was held on October 7th at Cairo, N. Y., with eight members present out of the twenty-two members of the Society. The guests of the Society were Dr. Thomas Parran, Jr., State Commissioner of Health, and Dr. Huntington Williams. District Health Officer.

Dinner was served at 1 P. M. and the meeting was called to order immediately afterward by the President, Dr. D. Sinclair of East Durham.

Dr. Waller, Chairman of the Legislative Com-

mittee made his annual report.

The Treasurer's report showed a satisfactory

Letters from Dr. Ross, President of the State Society, and Dr. Edgar Vander Veer, President of the Third District Branch, were read expressing their regret at not being able to attend.

The President appointed Drs. Honeyford and

Van Hoesen a committee to draft resolutions on the death of Dr. Charles P. McCabe, ex-president

of the Third District Branch.

The principal speaker was Dr. Parran, State Commissioner of Health, who took for his subject "The County Health Unit and the need of Hospital Facilities for the County." Dr. Parran was given a rising vote of thanks for his delightful talk. A general discussion followed clearing up many points not before understood.

A committee of five was appointed to confer with the existing Hospital Committee, the Board

of Supervisors and the Public Health Nurse Management Committee, and to have the power to associate with them representative citizens of the county. The purpose of this committee to be to gather data regarding, (1) the establishment of a hospital, (2) the plan of operation of the Committee on Public Health Nursing, (3) to look over the needs of the county-in the way of Public Health, (4) to obtain information as to what is being done in other counties relative to the operation of County Health Units, and (5) to determine, if possible, if such a plan is desirable and feasible in Greene County.

The President appointed on this committee, Drs. Rapp, Honeyford, A. O. Persons, Van Hoe-

sen and Daley.

The following officers were elected for the year 1931:

President......Dr. M. H. Atkinson, Catskill Vice-President., Dr. I. E. Van Hoesen, Coxsackie Secretary..........Dr. W. M. Rapp, Catskill Treasurer......Dr. C. E. Willard, Catskill Chairman, Legislative Committee,

Dr. P. G. Waller, New Baltimore

Chairman, Committee on Public Health

and Public Relations..Dr. A. B. Daley, Athens Delegate to State Society,

Dr. F. W. Goodrich, Catskill The minutes were then read and adopted as read, and the meeting adjourned.

W. M. RAPP, Secretary.

#### RADIOGRAMS OF THE ERIE COUNTY MEDICAL SOCIETY

The Erie County Medical Society is continuing the radiograms broadcast on Saturday evenings from 7:45 to 8 o'clock, through station WGR. The Spring program was printed in this Journal of February 15, 1930, page 236. The program of this Fall is as follows:

Aug. 2—Early Diagnosis of Tuberculosis, Dr. Julius Ullman.

Aug. 9-City's Part in Preventing Tuberculosis, Dr. Nelson W. Strohm.

Aug. 16-Light and Tuberculosis, Dr. Horace LoGrasso.

Aug. 23-Dangers of Exercise in Tuberculosis, Dr. J. Herbert Donelly.

Aug. 30—Advice to the Tubercular and Hints for the Well, Dr. Nelson W. Strohm. Sept. 6—Medical Treatment for the Tubercu-

lar, Dr. Donald R. McKay.

Sept. 13—Surgical Treatment for Tuberculosis, Dr. Henry N. Kenwell.

Sept. 20—Heart Disease as a Public Health Factor, Dr. Louis H. Chely.

Sept. 27—Diabetes, Dr. Richard N. DeNiord.

Oct. 4—Bright's Disease, Dr. Richard N. De-Niord.

Oct. 11-Rheumatism, Dr. Julius Ullman. Oct. 18-Pneumonia, Dr. Julius Ullman.

Oct. 25—Cause of Asthma, Dr. Salvatore J. Parlato.

Nov. 1—Treatment of Asthma, Dr. Salvatore I. Parlato.

Nov. 18-Indigestion, Dr. Paul H. Sandresky. Nov. 15-The Public Health Nurse, Bertha H. Gibbons, R.N.

Nov. 22-The Fear of Dental Treatment, Hector G. Marlatt, D.D.

Nov. 29-Preventing Diseases of the Teeth and Gums, Leslie R. Murray, D.D.S.

Dec. 6—Halitosis, Speaker to be announced.

Dec. 13—Cancer Control as a Public Health Problem, Dr. Augustus W. Hengerer.

Dec. 20-Some General Dietary Hints for the Holidays, Dr. Francis E. Fronczak.

Dec. 27-Improving Your Looks by Plastic Surgery, Dr. Charles B. Handel.

Jan. 3-Headaches, Dr. Frank J. Montrose.

#### CLINTON COUNTY

The Annual Meeting of the Clinton County Medical Society was held at Plattsburg, N. Y., on Tuesday, Oct. 14, 1930, at 6:30 P. M.

The meeting was preceded by a dinner at which there was an attendance of twenty-three, and during which part of the business of the session was

transacted.

The following officers for 1931 were elected: President, Dr. L. G. Barton, Jr.; Vice-president, Dr. I. H. Haynes; Treasurer, Dr. F. K. Ryan; Secretary, Dr. L. F. Schiff; Censors, Drs. Macdonald, Dare, and Rowlson; Delegate, Dr. A. S. Schneider; Alternate, Dr. L. G. Barton, Jr.; Dr. E. Wessell of Plattsburg was elected a member of the Society.

The Maternity Survey Committee presented a statistical report and asked for a little more time in which to make a final analysis of the figures

presented. (See page 1306.)

The following topics were discussed and disposed of as indicated:

Hourly Nursing—referred to a special com-

Committee on Medical Economics—Presi-

dent authorized to appoint one. Physicians in Relation to Public Welfare Law-committee requested to prepare report at the earliest possible date and present to Comitia

An amendment raising the annual dues to \$5.00

was adopted.

The scientific program consisted of an address by Dr. Arthur H. Krida of New York, "Surgery of the Knee Joint" illustrated by lantern slides; and the President's address by Dr. A. S. Schneider, "Phlyctenular Disease in General Practice."

Dr. Krida was elected an honorary member of

the Society.

#### ROCKLAND COUNTY

The fall meeting of the Rockland County Medical Society was held at Letchworth Village on September 24th. The members of the Society were guests of Dr. C. S. Little, Superintendent of the Înstitution.

A most inspiring address was given on Mental Hygiene by Clifford W. Beers who gave a brief review of his remarkable book "A Mind That Found Itself." Mr. Beers was a New Haven boy who graduated from Yale in 1897, and in 1900 broke down mentally and became a patient. After three years of mental illness he re-entered the world of men. With recovered sanity, he abandoned his business career to devote his life to the Mental Hygiene movement and in 1901 the National Committee for Mental Hygiene was organized.

What the National Committee has accomplished in its nineteen years of life under Mr. Beers is well known. Through the general propaganda that it has sponsored and the specific surveys that it has conducted with the financial aid of the Rockerfeller Foundation, institutional facilities of a proper type have been vastly expanded and placed under competent psychiatric direction.

In closing, Mr. Beers urged the members of the Medical Society present to consider the psychopathology of the patient and to correct it as far

as is possible.

The meeting was well attended, and the members thoroughly enjoyed the hospitality of the genial Superintendent. Two new members were elected to the Society.

W. J. RYAN, Secretary.

#### WASHINGTON COUNTY

The annual meeting of the Medical Society of the County of Washington was held at Hudson Falls, October 7, 1930, at 4:30 p. m.

Members present: Drs. Banker, Paris, Samuel Pashley, Samuel Pashley, Jr., Orton, Borrowman, Park, Prescott, Munson, Bailey, MacArthur, Cuthbert, Leonard, Oatman and Casey.

Visitors: Drs. J. W. Dean, Annette Barber, George M. Mackenzie and Mrs. Thompson, nurse. The Treasurer's report was read and approved

showing a balance of \$124.86.

The report of Comitia Minor was read.

The following officers were nominated and elected: President, B. C. Tillotson; Vice-President, D. M. Vickers; Secretary, S. J. Banker; Treasurer, C. A. Prescott. Censors: A. E. Falkenbury, Samuel J. Pashley, Jr., J. H. Ring. Committee on Legislation: W. A. Leonard, E. D. Mac-Arthur, W. L. Munson.

Dr. Orton read a paper on "The Injection Treatment of Varicose Veins," and as a preliminary suggested caution in the routine use of digitalis in pneumonia.

Dr. Cuthbert read a paper on "Mediastinal Aneurism" and reported some very interesting cases, showing the X-ray findings.

Adjourned for dinner.

Evening Session: Dr. George M. MacKenzie read a paper on "Visceral and Referred Pain." Very interesting and instructive.

S. I. BANKER, Secretary.

### SCHOHARIE COUNTY

The seventy-third annual meeting of the Schoharie County Medical Society was held in Cobleskill High School Tuesday, October 14, 1930. The meeting was called to order at eleven o'clock A. M. by Edgar S. Simpkins, President of the

Society.

The following who had been placed in nomination for 1931 at the semi-annual meeting were duly elected: President, Joseph F. Duell, Jefferson; Vice-President, Ward L. Oliver, Cobleskill; Secretary, Herbert L. Odell, Sharon Springs; Treasurer, Le Roy Becker, Cobleskill; Censor, Willard T. Rivenburgh, Middleburgh; Delegate to State Society (with power of substitution) David W. Beard, Cobleskill. Committees appointed: Legislative, H. R. Bentley, L. R. Becker, C. L. Olendorf; Public Health, H. L. Odell, W. S. Pomeroy, L. Driesbach; Publicity, J. J. Beard, L. Driesbach, R. G. S. Dougall; Public Relations, L. R. Becker, W. S. Pomeroy, D. W. Beard; Physical Therapy, M. Bruce, R. G. S. Dougall, D. W. Beard. A committee consisting of Drs.

Odell, Becker and J. J. Beard was on motion appointed to frame resolutions on the death of Dr. Adam Y. Myers. The Chairman of the Legislative Committee gave a short verbal report.

The Treasurer reported a present balance of \$85.08, with some bills still unpaid. The bill for the Eastman films was on motion ordered paid. An adjournment was taken for luncheon at Hotel Augustan after which the Society reconvened in the lecture room of the High School for the scientific session.

Drs. Edgar A. Vander Veer and Homer I. Nelms of Albany gave a most excellent paper on "Nervous Indigestion" well illustrated by x-ray films. A rising vote of thanks was given Drs. Vander Veer and Nelms for their meritorious paper.

Dr. David W. Beard presented a series of three Eastman films on "Injuries of the Hand." The series was very complete and helpful, and was

thoroughly appreciated by those present.

H. L. ODELL, Secretary.

### NASSAU COUNTY

The October issue of Nassau Medical News, the monthly publication of the Medical Society of the County of Nassau, contains an argument for the support of the following proposition:

"Shall the appropriation of the sum of One Million Seven Hundred and Fifty Thousand Dollars (\$1,750,000) made by the resolution entitled 'A Resolution to establish a public general hospital for the care and treatment of the sick in the County of Nassau and to appropriate the sum of One Million Seven Hundred and Fifty Thousand Dollars (\$1,750,000) for said purpose and to provide for the submission of a proposition to approve said appropriation at the next General County Election, adopted by the Board of Supervisors of the County of Nassau on the 6th day of October, 1930, for the acquisition of lands and the erection of buildings for the purpose of erecting and establishing a public general hospital for the care and treatment of the sick in the County of Nassau in the manner provided in said resolution, be approved?"

The News says:

"To lose the election this year would mean a delay of several years before we could hope for another opportunity as favorable as this. Remember that this is the third attempt that the Medical Society has made to secure these facilities. In 1922 there was presented to the Board of Supervisors a petition asking for the erection of a contagious disease hospital. In 1923 the Medical Society made a very elaborate survey of the hospital situation of the county and again urged the erection of a hospital for the care of these neglected cases. This time we have invested two years of real hard work. This time we have gotten support from the most influential people in the county. This time we actually have an opportunity to let the people decide.

"Let us not miss this opportunity. Get out the vote. Tell people what this hospital means. More than that, tell the people what it would mean to

lose it."

The county medical society is also sending out a four-page handbill describing the proposed hospital and the cases for which it is designed. It calls attention to the great success of the County Tuberculosis Hospital at Farmingdale, and proposes that the new hospital shall be managed in a similar way. The last page of the hand bill contains letters from prominent people and officials of Nassau County favoring the hospital.

Volume 30 Number 21 1311

### THE DAILY PRESS

JIMMIE!

Unfair Competition

By Gene Byrnes

From N Y Herald Tribune, August 1, 1930

#### SCIENTIFIC VALUES

James J. Montague, in his verse in the New York *Herald Tribune* of April 24, sets forth a mental attitude which physicians have to consider. Astronomy enables world commerce to

> Astronomers are men who ply The trade of studying the sky;

They're happy, if into their ken A comet rambles now and then,

Or if, some lucky night, they view A planet which is fresh and new.

With souls alight with eager hope They sit behind a telescope

And seek, in some sidereal zone, A sphere which is as yet unknown.

Yet these strange bodies that they see Are of no use to you or me. traverse the seas; and now research workers, searching the infinitely small, are charting the way of health and life for every human being to follow.

We cannot on them file a claim And add them to our broad domain,

Or vote their people yea or nay Upon our next election day.

Or make them vote their acceptation Of sumptuary legislation

What they discover in the skies May make us possibly more wise,

But I can't understand how it Can be of any benefit.

For any good it does the nation Theirs seem a useless occupation.

#### TWO VIEWS OF "TALKIES"

The New York *Times* of October 9 comments editorially on the nerve-breaking work of running talking movies and says:

"Varied are the protests against that lusty infant industry, the talking pictures. They are threatening the very existence of the legitimate theatre; they have ruined the cinema palace as a place for a quiet nap; they have thrown numbers of worthy musicians out of work; they have sidetracked the art of the silent screen, and even keep people from patronizing midget golf courses.

"The latest complaint comes from the operators in Liverpool. They threaten a general strike because their work has been 'rendered much more onerous' since the introduction of talking pictures. The ordeal of listening hour after hour to the noise of loud-speakers in the operating boxes is 'ruining the physical and nervous system' of many operators. They ask for shorter hours and noise relief."

On the other hand, the authorities of the Pennsylvania Railroad are installing "Talkies" in the New York Station, according to the following note in the New York Times of October 15:

1312

"Radio music will be diffused through the main rotunda of the Pennsylvania Station through an elaborate loud-speaker system which is now being installed by engineers of the Radio Corporation of America, it was learned yesterday.

"Six powerful reproducers will be hidden at the ends of the station near the ceiling. The idea is to entertain travelers waiting for trains and to 'calm the commuters,' officials declared. music will be regulated so that there will be no 'bedlam,' it was said, but merely 'music quietly floating through the air.' Tests are made between 3 and 4 o'clock in the morning. The apparatus will be arranged to pick up radio broadcasts and also to play recorded music."

(We hope the report is exaggerated for we are a Long Island commuter.—Editor's note.)

### SYRA, THE ISLE OF THE BLESSED

the following editorial allusion which may send some classical physicians to their Greek textbooks:

"A dispatch in yesterday's Times from Athens tells of an event on the isle of Syra that crowns one of America's most beneficent philanthropies. It was this isle that Eumaeus described to Ulysses in the Odyssey:

"There is an island called Syra, above Ortygia, · where are the turning places of the sun. It is not very thickly settled, but is a good land, rich in herds, rich in flocks, full of wine, abounding in wheat. Famine never comes to the land, nor does any hateful sickness besides fall on wretched mortals; but when the tribes of men grow old throughout the city, Apollo of the silver bow comes, with Artemis, and assails them with his gentle shafts and slays them.'

"On this isle, now a commercial centre among the Cyclades, a short voyage from the Piraeus, the Near East Relief built an orphanage which at times held as many as 3,000 refugee children. There it fed and clothed them, gave them some

The New York Times of October 16 makes such training as boys and girls in America have, and taught them the beginnings of simple trades. They learned to make their own clothes, cultivated their gardens and fields, and even helped to build the walls of their temporary home. Now they are nearly all living among their people and earning a livelihood. The Syra institution is more delightfully situate than some of the other orphanages, but it has typified in its program the work of all throughout the Near East. All together, 132,000 children have passed through them, while other hundreds of thousands have been helped in their distress.

> "The buildings and equipment at Syra have now with high ceremony, in which the American Minister and Prime Minister Venizelos participated, been transferred for a period of five years to a Greek Foundation, to be used as a vocational trade school, specializing in textile trades.

"Ancient Greece gave the world the word 'philanthropy.' America has given her gratitude and mercy back in substance and sacrifice which have made an ampler definition for that word than the Near East has ever before known."

### NOISE ABATEMENT IN NEW YORK CITY

An editorial writer in the New York Sun of September 29 turns to classics for illustrations of sensitiveness to noise, although he takes the allusions secondhand, as the following quotation shows:

"The inhabitants of Sybaris dwelt in peace and luxury on the shores of the Gulf of Tarentum a thousand years or two before the malarial mosquito settled down there. The Romans thought them effeminate, and their civilization effete. They scoffed at the city's zoning regulations, and particularly at the ordinance prohibiting industrial noises in residential areas. Possibly having in mind this unusual sensitiveness to unseemly din, they invented the tale about a Sybarite who was unable to sleep because a petal was crumpled in his bed of rose leaves. The Sybarites may have been the first, but were certainly not the last, city-dwellers to yearn for peace and quiet. Carlyle dreaded the sound of a cock-crow. Schopenhauer was tortured by the crack of a carter's whip. Herbert Spencer used to plug his ears with wool and think great thoughts.

"For all these and a wealth of other equally entrancing historical allusions the public is indebted to the Noise Abatement Commission, whose report was published yesterday. It is a handsome volume, illustrated with contemporary cartoons, and popularly edited—for no commission will ever be able to deaden the din without popular support.

"The commission recommends, besides a noise squad, an 'energetic educational campaign to arouse public consciousness to the evils of noise and the advantages of a quieter city.' City dwellers can never look forward to a day-or even a night-when their streets will be as silent as the Antarctic wastes and a man can hear his own heart-beat. But they can, if they insist upon it, come to enjoy a far more peaceful lot than is theirs today."

### BOOK REVIEWS

SLEEP AND THE TREATMENT OF ITS DISORDERS. By R. D. GILLESPIE, M.D. 12mo of 267 pages. New York, William Wood & Company, 1930. Cloth, \$3.25. William Wood & Compar (Minor Monograph Series.)

Dr. Gillespie presents an exhaustive and authoritative treatise on the subject of sleep. He expounds the physiological changes accompanying sleep, including a discussion of the experimental effects of sleeplessness in animals as well as in man. Following this theoretical introduction he next considers the various disturbances of sleep such as night-terrors, narcolepsy, and somnam-The management of these disturbances are carefully analyzed, and the pharmacologic actions of the various sedatives are by no means overlooked.

EMANUEL KRIMSKY.

Ker's Infectious Diseases: A Practical Handbook, Revised by CLAUDE RUNDLE, O.B.E., M.D. Third Edition. Octavo of 614 pages, illustrated. London and New York, Oxford University Press, 1929. (Oxford Medical Publications.)

This is the third edition of Ker's textbook of infectious diseases. The first edition was published in 1907, and the second in 1920.

The original edition was based upon the lectures delivered by the late Dr. Claude Buchanan Ker to the students of the Edinburgh University and has maintained a high standard of descriptions in that the author recorded his own observations and experiences in a field

in which he was an authority. Following the augmentation in our knowledge concern-

ing the infectious diseases which occurred during the Great War, the volume was revised by Dr. Ker. The present edition has been contributed by Dr. Rundle and is published with the purpose of bringing the work up to date by incorporating the results of recent advances in the study of the etiology, prevention and treatment of scarlet fever, measles and diphtheria, and at the same time maintaining fairly intact the careful, admirable and masterly clinical descriptions of the original text.

The book can be recommended, indeed, as a valuable textbook in this important field. It has been carefully printed and the paper and binding are excellent.

JOSEPH C. REGAN.

TREATMENT IN GENERAL PRACTICE. By HARRY BECK-MAN, M.D. Octavo of 899 pages. Philadelphia and London, W. B. Saunders Company, 1930. Cloth,

\$10.00. "The neglect of thorough and painstaking teaching of therapeutics in this country is not so often the subject of serious consideration in our medical councils as it might well be. With only a few notable exceptions, the medical schools seem content if there is presented within their halls, usually to junior students who have had as yet practically no contact with the sick, a ridiculously inadequate course of lectures, the rest being left to the teachers in the departments of medicine, pediatrics, etc. And these later seem to shift the responsibility largely onto the gods, not through any culpability on their part, but simply because of their immersion in the task of of acquainting the student with the prodigious method ology of modern diagnosis, no time is left for an exhaustive consideration with him of the treatment of disease." Thus, Dr. Beckman begins his excellent book and then proceeds to correct as best he can the shortcomings of the medical curriculi. And he has made a very good job of it; for he has presented modern treatment in a manner that is scientifically accurate and amply comprehensive. Furthermore, his style is entertaining and extraneous matter has been judiciously eliminated. In eight hundred pages he has presented a large subject in a very complete form.

This is one of the best books on modern therapy that has come to the attention of this reviewer.

M. F. DeL

PRACTICAL PSYCHOLOGY AND PSYCHIATRY. For Use in Training-Schools for Attendants and Nurses and in Medical Classes, and As a Ready Reference for the Practitioner. By C. B. Burr, M.D. Sixth Edition. Octavo of 378 pages, illustrated. Philadelphia, F. A. Davis Company, 1930. Cloth, \$2.75.

This is a manual of 378 pages. About one-third of the subject matter is related to a discussion of normal and abnormal psychology which leads readily to the study of mental disease types, the latter being instructively and interestingly presented.

Considerable space is given to the matter of treat-ment and many helpful suggestions are available for

both nurse and physician.

The very important subject of mental hygiene is deservedly stressed, the different phases being discussed from practical standpoints, beginning with child guidance and healthy habit formation, and continuing on with instructions adapted to youth and early adult life. The book contains a wealth of information of value to anyone interested in the care of mental cases, or in disseminating information calculated to give the great mass of the people a more normal outlook upon life, mass of the people a horizontal disease in the volumer generation.

A. E. SOPER.

SURGICAL DIAGNOSIS. By American Authors. Edited by Evarts A. Graham, A.B., M.D. Three Octavo Volumes and Index, totalling 2989 pages and 1281 illustrations. Philadelphia and London, W. B. Saunders Company, 1930. Cloth, \$35.00 a set.

Publications, the primary purpose of which is to shed light on the always baffling problems of diagnosis, are welcome. Alexander Johnson, for so many years an associate of Charles McBurney, two decades ago contributed to surgical archives his masterly monograph (in three volumes), on surgical diagnosis. An individual effort, the product of a keen mind and rich experience, it stands to this day as a monument to sagacious clinical observation.

It is trite to say that the last twenty years have been marked by the greatest strides forward in all history. In this time medicine has kept pace with scientific progress and so it is that these volumes, depicting as they do what medicine of today offers diagnostically, are op-

portune.

"Wisdom is the vital union of art and science." Dr. Graham, with his more than forty co-writers, has evolved a work thoroughly in consonance with that statement. In the three volumes (with desk index) conveniently arranged by regions are set forth, briefly and in orderly fashion, surgical diseases, pitfalls relating thereto and diagnostic aids therefor. Each section has been written diagnostic aids therefor. Each section has been written by men, singly or in groups, who have special knowledge, training, experience in the special field with which they deal. Under the competent editorship of Dr. Graham, these articles have been blended into a work of admirable excellence. The student and practitioner of surgery will alike find this publication modern, well balanced and F. D. J.

### OUR NEIGHBORS

### AN ADVERTISING OPINION FROM MINNESOTA

The October issue of Minnesota Medicine has the following editorial on medical adver-

"Advertising is contrary to the code of medical ethics. The same rule applies to all professions and this is one of the outstanding differences between a profession and a business. While the physician is, perforce, dependent upon his fees for his livelihood, monetary return is not and should not be the prime consideration. Advertising smacks too much of a

purely business proposition.

"In a recent editorial, the Minneapolis Journal takes the profession to task for not changing its code of ethics regarding advertising. The editor thinks we should use this same tool which quackery has so misused and that the public suffers because we fail to inform them as to what we have to offer for the alleviation of physical ills. We cannot agree that the public would be better served if physicians began to advertise.

'What would we advertise? Our specialties? Then how about the general practitioners? The diseases we can cure? This presupposes a diagnostic ability on the part of the patient. Or perhaps we should publish our faces? Not so good.

"Obviously the newspapers would all favor the adoption of advertising by physicians. How about increasing the cost of medical service? The prohibition of advertising places no physician at a disadvantage.

"Most publicity amounts to advertising. This is the reason that the physician to be

consistent is inclined to sidestep publicity. This does not mean that the public is deprived of medical information. What with health journals such as Hygeia and the Public Health Journal, radio broadcasting by national and state medical associations and health articles in newspapers and magazines, the intelligent reader can easily keep posted.

"The newspapers themselves are to a certain extent to blame for the usual reticence on medical matters encountered by them. Information, when given, is likely to appear in a distorted, sensational write-up featuring the individual rather than the subject matter. The public is interested in individuals rather than

abstract facts, we are told.

"Medical groups — so-called clinics — are bound by the same rules of ethics as individual physicians. Articles sometimes appear without the sanction of the individual physician or the group, but not infrequently a group utilizes publicity methods or even solicits patronage in a manner that would be severely criticised in an individual. A hospital sometimes advertises and incidentally the medical group which owns or patronizes the hospital receives publicity. A hospital, in our opinion, should not be operated as a money-making proposition and therefore should not resort to advertising in lay magazines or newspapers.

"No, we can see no reasons for changing the status quo of medical advertising; and there are many reasons why we should continue to play the game according to the present rules." (See page 1291).

### COMMONWEALTH FUND IN RURAL HEALTH IN MASSACHUSETTS

The New England Journal of Medicine of September contains a plan for aiding the rural health service of Massachusetts by means of financial grants and supervision of the Com-

monwealth Fund. The article says:

"Two years ago, Governor Allen recommended legislation allowing towns to combine in health districts for the employment of a full-time executive health officer and staff. Such a bill was introduced by Professor C. M. Hilliard of Simmons College and was passed by the Legislature. Although Lee, Lenox and Stockbridge have combined to give an admirable adequate milk inspection service, no towns have as yet combined for the all-round health service thus contemplated. Now along comes the Commonwealth Fund of New York with the aid and incentive necessary to promise real success.

"Massachusetts and Tennessee are the two states selected for aid in developing rural health service. Nearly \$100,000 will be put into this program here each year for three to five years. The following features of the Commonwealth Fund program show constructive thinking:

MYIES ROSER CO. LIN

Sample and literature upon request. .

DAVIES, ROSE & Co., Ltd. Pharmaceutical Manufacturers, Boston, Mass. (Continued from page 1314)

Funds for developing the 1. Education. teaching of preventive medicine in medical schools and postgraduate training for general practitioners engaged in rural practice will be available. Also, assistance will be given to some teacher training school in developing courses in health education,

(a) Medical students. About five scholarships will be offered in some Massachusetts medical school to students who will agree to practice following their hospital internship for at least the first two years in a small community. If the recipient changes his mind he is asked to repay the loan; otherwise not.

Some fifteen physicians, (b) Physicians. largely selected from the health districts, will be given, each year, their tuition, travel and \$1,000 for four months' study. The Fund must approve the course and the school. Fund is not interested in making specialists out of general practitioners, but it is deeply interested in encouraging study in various fields of general medicine, surgery, pediatrics and obstetrics. In this way men graduated some years since may become familiar with the more recent advances. Thus is recognized by a great foundation that in an informal medical profession is the basis of sound public health work.

(c) Certain scholarships will be offered public health nurses for postgraduate study in their many fields.

(d) Certain scholarships for teachers interested in health education will be available.

2. Coordinating Unit. Funds will be made available for organizing a unit in the State Department of Public Health which will develop, advise and coordinate the activities of the health districts organized under this plan. This unit will be composed of a medical health officer, public health nurse and sanitary inspector.

3. Aid to Districts. A limited number of health districts (two the first year) that develop programs and staff that seem to the Fund adequate will receive financial aid.

In addition to the above, the State Department of Public Health can contribute in suitable instances toward the salary of the local health officer by appointing him a part-time epidemiologist of the Department. It will be of great help not only to the local communities but to the entire state to have more trained health officers available for emergency service, in their respective localities.

Here then is given to us a plan adapted to our needs which will give our rural people this much needed skilled full-time service. Will they accept it?

The forces working against it are community jealousies, inertia, and suspicion.

Those working for it are the disinterested professional and lay people who realize the shocking neglect in the application of precise knowledge available today for the reduction of sickness and death among the people. May we not be found wanting in making amends for past neglects now that the means have been given us"

### FREE MEDICAL SERVICE IN MILWAUKEE

The October issue of *The Wisconsin Medical Journal* contains the following report of a survey of medical charity given in Milwaukee during the year 1929:

"A recent survey made by The Medical Society of Milwaukee County revealed some interesting facts relative to charity work done by the doctors in Milwaukee during 1929, in and out of private practice.

"A questionnaire was sent to each of the 640 members of the Society, 220 returning their questionnaires completed. Of this number 120 stated that they kept no record of charity work; 60 stated that they kept records.

"Approximately 11,532 patients were cared for by 125 doctors or on the average of 93 patients a year each; 133 doctors stated that they valued the charity work done by them at \$136,268 or on the average of \$1,024.72 each.

"The loss in bad accounts as reported by 63 doctors was 12.6%. The loss in dollars and cents as given by 86 doctors was \$78,658 or on the average of \$942.62 each.

"Of the 220 reporting, 89 doctors stated that they held full or part time clinic appointments. They stated that during the year 1929 they had given 467 hours of free service in clinics or on the average of 34 days each annually.

"The total value of charity service, in institutions of those reporting was \$206,076 or on the average of \$2,676.13. It was felt, by 46 of the doctors reporting that 27% of those accepting charity could pay.

"On the basis of the returns it appears that some 57,000 charity patients were cared for by doctors in private practice in Milwaukee during 1929. The total cost of caring for patients in private practice on the basis of regular medical fees would have been \$680,000. The value of service rendered in free dispensaries and clinics was approximately \$620,000. The total free medical service rendered by members of The Medical Society of Milwaukee County was approximately \$1,300,000 during 1929."

Finding one's way about

ARE you ever confronted with the need of finding your way amidst the therapeutic maze in the selection of the right remedy for constipation?

There is a simple, sure path you can safely follow when you select Agarol the original mineral oil and agar-agar emulsion with phenolphthalein. There are no contraindications to its use; no "ifs" no "buts."

Just the right amount of thoroughly emulsified mineral oil to supply unabsorbable moisture to the intestinal contents and make their passage easy and painless. Just the right degree of peristaltic stimulation to make the result certain and facilitate regular habit formation.

One tablespoonful at bedtime

is the dose

Final decision on the true worth of Agarol rests with the physician. We will gladly send a twin package, withliterature, for trial.

AGAROL for Constipation

### ANNUAL MEETING OF WISCONSIN

Editorial comments on the annual meeting of the State Medical Society of Wisconsin are contained in the October issue of *The Wisconsin* 

Medical Journal, which says:

"With an attendance of one-third of all the members of the State Society, the 89th Anniversary Meeting held in Milwaukee during the week of September 9th exceeded all previous records and is believed to have set a national record for societies of comparable size.

"The 1930 meeting, placing emphasis on a program for the general practitioner, had four outstanding features which seemed to meet with the

approval of the membership.

"All sessions on Wednesday and Thursday were contained in the Schroeder Hotel, headquarters of the meeting. The afternoon sessions were divided into three separate parts in separate rooms from two until four to permit of greater opportunity for choice of subject matter. At four the members convened in the Grand Ball Room for the orations.

"The alumni luncheons were held on Wednes-

day noon. Thursday noon was devoted to nine round table luncheon conferences, attendance limited to twenty each, for the general discussion of previously announced subjects under the direction of selected discussion leaders. Despite the fact that each reservation had to be accompanied by check in advance covering the cost of the luncheon, each conference was filled and not all applicants could be accommodated. One hundred and eighty members were accommodated in these luncheon conferences on Thursday noon and their distinct success promises their further development for the 1931 session.

"Instead of a full third day program on Friday the plans were so changed as to permit the members to choose any one of ten hospital clinics arranged by staff members at Milwaukee hospitals from nine to twelve. Over seventy staff members participated in these programs and the total

attendance was over three hundred.
"Friday afternoon was then devoted to the annual golf tournament instead of a sixth half day

of scientific program."

### ANNOUNCING SORICIN CAPSULES

WHEN Larson first suggested the use of Soricin (purified sodium ricinoleate) as a detoxifying agent, he opened up an entirely new method of combating infection.

Detoxification with Soricin was first applied in dentistry, where it has afforded brilliant results in the treatment and prevention of oral infection in the mouth. The use of a detoxifying agent in medicine and dentistry is based upon its ability to render pathogenic organisms non-pathogenic, and to detoxify their toxins. This prevents the absorption of toxins from the focus of infection and the consequent development of secondary infections.

Detoxification has been confirmed by Cesari, Cotoni and others at the Pasteur Institute in Paris, who have reported that their experiments confirm Larson's work. More recent investigation has revealed the

fact that detoxification is as applicable in the treatment of infections of the intestinal tract as it is in the control of mouth infections.

For the past two years, Morris, Dorst and others have studied the action of Soricin in the bowel and have now reported their results fully in current medical literature. Their clinical studies show that Soricin Capsules when given by mouth afford prompt relief in colitis and other diseases of the intestinal tract. The experimental work so far completed justifies the further clinical study of this important drug by the medical profession.

If you are interested in the work of these investigators, we would be glad to send you, free of charge, a supply of Soricin Capsules, together with complete clinical information. THE WM. S. MERRELL COMPANY, CINCINNATI, OHIO.

### RADIO PROGRAMS IN MINNESOTA

The October issue of Minnesota Medicine gives a report of the Radio Committee as follows:

"One hundred seventeen radio programs were broadcast under the direction of the Radio Committee from April 3, 1928, to June 1, 1930. With the exception of two programs from KSTP, all have been sent from Station WCCO.

"The regular health service feature has been given every Wednesday morning at 10:15 with the exception of holidays, by Dr. Wm. A. O'Brien, Associate Professor of Pathology,

University of Minnesota.

"Censorship.—Station WCCO volunteered to turn over the problem of passing on all medical advertising to the Committee. Since then, nothing has appeared on the air from WCCO of objectionable nature, because of this arrangement. There was one program which was approved and later proved to be objectionable. This was because of misrepresentation on the part of the advertiser, and the station regrets it just as much as we do.

"Publicity.—Good publicity has been received from all the papers and the station. Announcements of the programs appear in the press and are given over the air at frequent intervals. In addition, since January 1, 1930, all programs have been made in advance and are now published in Minnesota Medicine. More recently they have been carried by the Journal Lancet and some of the newspapers. Everybody's Health now carries 'Health from the Air' extracts from the programs since May 1, 1930.

"Audience.—We are still reaching the State of Minnesota, parts of North and South Dakota, Iowa, Wisconsin, and northern Michigan. We have been informed that our audience has grown to a remarkable size and that the health service feature is now one of the main attractions of WCCO. Letters from interested listeners vary from four to three hundred per talk. When the audience is promised a copy of the talk, a large number write in; otherwise, few letters are received except those asking for advice and offering suggestions for future programs. As the program is part of the Women's Hour feature of the station, naturally, a large percentage of our audience is We believe this is very desirable as it is through the women that we reach the home and family. The number of convalescents, invalids, and shut-ins remains about the same. They have been very much interested in the talks and write frequently.

"Our letters also indicate that a large number of men are now listening. This is very

### CONSULTATION BUREAU IN MINNESOTA

The Minnesota State Medical Association established a Consultation Bureau early in the year 1929, and conducts a consultation page in the Minnesota Journal. A report of the activities of the bureau is contained in the October Journal as follows:

March 21, 1929 to Sept. 20, 1929.

Organized March 21, 1929.

First inquiry received within 24 hours after announcement; 55 inquiries have been received to September 20, 1929.

Types of inquiries received are as follows:

Case reports, 29; requesting general information, 5; requesting prognosis, 1; requesting diagnosis, 4; requesting treatment, 10; requesting diagnosis and treatment, 7; reading of dental films, 1; question of industrial disease, 1.

Publications—books to buy, 3; where to publish articles. 1.

Apparatus and Appliances, 3.

Medical-Legal, 4.

Locum Tenens Appointment, 2.

General—treatment of diseases, 3; courses of study, 2; reliability of radium corporation, 1; State aid for charity patient, 1; patent medicine, 2 drugs, 1; therapy, 1; blood test to prove paternity, 1; use of Schick Test, 1.

Four cases were followed up by further inquiry. Thirty-nine doctors have used the service.

Eleven doctors have sent in from two to four inquiries.

Number of inquiries received, according to month; March, 1929, 6; April, 1929, 15; May, 1929, 10; June, 1929, 6; July, 1929, 6; August, 1929, 6; September, 1929, 5.

Sept. 20, 1929, to May 20, 1930.

Types of inquiries received as follows:

Case Reports, 66; requesting general information, 11; requesting diagnosis, 12; requesting prognosis, 4; requesting treatment, 26; requesting reading of dental films, 1; requesting reading of x-ray pictures, 1.

General—information regarding schools, 1; information regarding books, 4; blood test to prove paternity, 2; patent medicine, 1; drugs, 1.

Medical-Legal, 1.

Forty doctors have used the service.

Eleven doctors have sent in from two to six inquiries.

Number of inquiries received according to month. October, 1929, 7; November, 1929, 4; December, 1929, 5; January, 1930, 7; February, 1930, 5; March, 1930, 3; April, 1930, 20; May, 1930, 15.

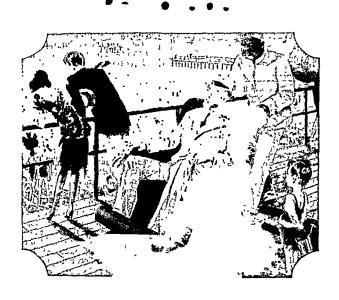

Patient Types . .

### The Rheumatic

Regular and adequate bowel elimination constitutes an essential part of treatment in the majority of patients suffering from the arthritic or gouty diathesis.

The comfortable action of Petrolagar is to be preferred to drastic physic. Petrolagar is pleasing to take and mechanically restores peristalsis without causing irritation and does not upset digestion.

Petrolagar, a palatable emulsion of 65% (by volume) pure mineral oil emulsified with agar-agar, has many advantages over plain mineral oil. It mixes easily with bowel content, supplying unabsorbable moisture with less tendency to leakage. It does not interfere with digestion.

Petrolagar Laboratories, Inc., 536 Lake Shore Drive, Dept. N Y. 11 Chicago, III. Gentlemen.—Send me copy of "HABIT TIME" (of bowel movement) and specimens of Petrolagas.

## PHILLIPS Milk of Magnesia

THE IDEAL LAXATIVE-ANTACID

The name "PHILLIPS" identifies Genuine Milk of Magnesia. It should be remembered because it symbolizes unvarying excellence and uniformity in quality.

Supplied in 4 oz., 12 oz., and 3 pt. Bottles.

THE CHAS. H. PHILLIPS CHEMICAL CO.

New York and London

# LIVER EXTRACT LEDERLE

A VERY palatable, highly concentrated fraction of liver for the treatment of Pernicious Anemia. Efficiency established by more than two years of clinical trial.

Physician's sample and literature on request.

LEDERLE LABORATORIES
NEW YORK

### MEDICAL SOCIETY ACTIVITIES IN OHIO

The first article in the Ohio State Medical Journal for October is the following editorial comment on Fall activities:

"Reports from many of the academies and county societies evidence the fact that the forth-coming months are to be of unusual educational value to Ohio physicians.

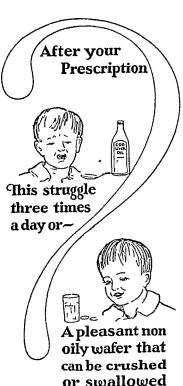

"Several societies have arranged joint meetings with neighboring county societies. Many have tentative plans for joint meetings and social gatherings with organizations composed of members of other professions, such as lawyers, druggists, dentists and ministers. Numerous interesting symposiums and clinics have been scheduled. In fact, an analysis of all the reports indicates that unprecedented emphasis is being placed this year by local medical organizations on the educational and scientific benefits that may be derived by all physicians in associating themselves with their colleagues in organized activities.

"Special emphasis also is being directed toward the business and economic questions of medicine and medical practice. Many local societies have scheduled symposiums for the discussion of economic and social problems as they affect the practice of medicine.

"Previous to the November election opportunity should be afforded every member of every county society to learn of the qualifications of all candidates for local and state offices, and especially of their attitude on medical, health and welfare questions. The legislative committeemen in each county society, in close touch with the Policy Committee and headquarters of the State Association, are prepared to make suggestions and lead discussions on matter of public policy both now and during the session of the Eighty-Ninth General Assembly.

"The Policy Committee has met frequently during the past three or four months and has already assembled information on scores of prospective legislative measures affecting public health and medical practice that must be met when the Legislature assembles. The Medical Economics Committee has been exceptionally busy on a study of the several important problems referred to it for investigation by the House of Delegates and the council. The Publication Committee has had its consecutive and many duties. The other state committees are and have been functioning on their multiple activities.

"Unity, concerted activity and keen interest are apparent in the ranks of the medical profession in Ohio as this high pressure period of the year arrives. These vital elements in organization must be maintained if the important questions and problems are to be successfully met."

### ESPECIALLY FOR CHILDREN

Write palatability into your prescription, if it is to be followed regularly. There is no Cod Liver Oil struggle against White's Cod Liver Oil Concentrate—and the Vitamin A and D potency exceeds N. N. R. requirements.

### The Pre-school Child

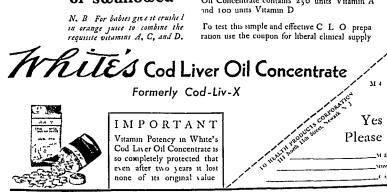

that is undernourished, underdeveloped or rachitte will take White's Cod Liver Oil Concentrate over long periods of time without usual repugnance.

### And During School

these same children, the T. B. contacts, the pretubercular, the malnutrition cases, may be given the pleasant little wafers easily, at meals, during recess, or in connection with their routine examinations.

### Vitamin A is most essential

for such cases, together with Vitamin D—and as a prophylacuc against respiratory and other infections. Each wafer of White's Cod Liver Oil Concentrate contains 250 units Vitamin A and 100 units Vitamin D

### CLASSIFIED ADVERTISEMENTS

Classified ads. are payable in advance. To avoid delay in publishing, remit with order. Price for 40 words or less 1 insertion, \$1.50; three cents each for additional words.

WANTED: SALARIED APPOINTMENTS EVERYWHERE for Class A Physicians. Let us put you in touch with investigated candidates for your opening. No charge to employers. Established 1896. AZNOE SERVICE is National, Superior. AZNOE'S NATIONAL PHYSICIANS' EXCHANGE, 30 North Michigan, Chicago.

### SANITARIUMS-FOR SALE

We have a number fully equipped, some partially so, and properties that can be made suitable; New York, New Jersey, Connecticut. Send for list and give number of rooms wanted for patients (approximately), also location derised. Address Swift Realty Co., 196 Market Street, Newark, N. J.

#### LITERARY ASSISTANCE

Busy physicians assisted in preparation of special articles and addresses on medical or other topics. Prompt service rendered at reasonable rates. Also revision and elaboration of manuscripts for publication. Please mention requirements. Authors Research Bureau, 516 Fifth Avenue, New York City.

Attractive Doctor's apartment available in exclusive Brooklyn residential section. Corner location. 8 rooms, 2 baths. Frivate entrance to office and waiting room. Office fully equipped if desired. Present occupant leaving for research work. Reasonable rental. See Agent, 1312 West 6th Street, or phone Windsor 0893

Sublease desirable additional space in Grand Central zone district to M. D., General Practitioner or specialist at low rental of two dollars and fifty cents (\$2.50) per square foot with telephone and secretarial service. Dr. S. N. Glasserow, 8 East 41st St., New York City

So. Orange, N. J.; corner property; 10-room house; 2-car garage; doctor's zone; good location for doctor or dentist; could be bought on easy terms. Address A. W. Preston, 236 So. Orange Ave.

DOCTOR'S APARTMENT FOR RENT. Six rooms, corner apartment, best section of 15th Ave. Bklyn. Large apartment house. Unusual opportunity for medical doctor. Reasonable rental. Immediate occupancy. Apply 5501—15th Ave., Bklyn., Cor. 55th, or Telephone Supt., Berkshire 9594.

### EFFECTIVE OCTOBER 1ST, 1930

Mead's Viosterol in Oil is now designated 250 D because in deference to Dr. Henry Steenbock—and in the interest of uniform nomenclature—this product is now assayed by his method. Before October 1, 1930, this same product was assayed by the McCollum-Shipley method and was designated 100 D.

Mead's Viosterol in Oil, 250 D (Steenbock method)—in normal dosage-is clinically demonstrated to be potent enough to prevent and cure rickets in almost every case. Like other specifics for other diseases, larger dosage may be required for extreme cases. It is safe to say-based upon extensive clinical research by authoritative investigators (reprints on request)—that when used in the indicated dosage, Mead's Viosterol in Oil, 250 D is a specific in almost all cases of human rickets, regardless of degree and duration, as demonstrated serologically, roentgenologically and clinically.

The change in Mead's Product is in designation only—not in actual potency. Mead's Viosterol in Oil, 250 D—in proper dosage—continues to prevent and cure rickets. See page xiii—Adv.

### BREEZEHURST TERRACE DR. HARRISON'S SANITARIUM

For Nervous and Mental Diseases and Alcoholic Addiction

Beautiful surroundings. Thirty minutes from Pennsylvania Station, New York

For particulars apply to Dr. S. Edward Fretz, Physician in Charge

Whitestone, L. I., N. Y. Phone: Flushing 0213

### PRODUCTS OF RESEARCH

From the research laboratories of Eli Lilly and Company comes report of two new products of such character as to interest a large number of clinicians.

Pulvules Sodium Amytal-filled capsules sodium iso-amyl-ethyl-barbiturate-are intended for oral use in the preoperative preparations of surgical cases and other purposes. Long clinical trial has shown that their use in conjunction with local and regional anesthesia has allayed the patient's preoperative apprehension and afforded protection against the undesirable psychic effects of operating room activities. They are also said to lessen the likelihood of toxicity due to the local anesthetic itself and to diminish nausea following the operation. Pulvules Sodium Amytal are supplied through the drug trade in bottles of 40 and 500 three-grain Pulvules.

Liver Extract No. 55 with Iron is the second item. It is not to be confused with Liver Extract No. 343, used so widely in the treatment of pernicious anemia. In fact, it represents that entirely different liver fraction which is effective in the production of hemoglobin and related pigments. In combination with ferrous ammonium citrate it has proved of distinct value in cases of secondary anemia.

This new Lilly Product is standardized on dogs made anemic by long-continued bleeding. The extract derived from 300 grams of fresh liver must produce an amount of hemoglobin equal to at least 65 percent of that produced by 300 grams of fresh liver. Liver Extract No. 55 with Iron is supplied in bottles containing the extract derived from 6½ pounds of fresh liver. To this has been added 231 grains of ferrous ammonium citrate.

Literature will be supplied by Eli Lilly and Company, Indianapolis, Indiana, upon application. See page xii -4dv.

PARKE DAVIS & CO DETROIT MICHIGAN

MEDICAL SERVICE BULLETIN ON

### THIO-BISMOL

Bismuth, in suitable chemical form, ranks next to arsphenamines as an antisyphilitic agent In the form of Thio-Bismol (sodium bismuth thioglycollate) it is taken up promptly and completely from the site of injection (the muscle tissues), reaching every part of the body within a short time with rapid therapeutic effect

The injections cause a minimum of tissue damage, for Thio-Bismol is not only water-soluble but tissue-fluid-soluble differing in this respect from other bismuth preparations The intramuscular preparations injection of Thio-Bismol causes,

as a rule, little or no pain

Not the least important factor in Thio-Bismol therapy is the co-coperation of the patient the injections are so well borne and their effects so manifest that the patient is more than willing to continue the treatment for the necessary length of time

Thio-Bismol alone or in conjunction with arsphenamine, produces rapid therapeutic improvement demonstrable by serologic tests and regression of lesions

Accepted for N N R by The Council on Pharmacy and Chemistry of the A

Boxes of 12 and 100 ampoules (No 156) each ampoule containing one average adult dose (0 2 Cm -3 grs ) of Thio-Bismol to be dissolved as needed in sterile distilled water a sufficient amount of which is supplied with each package

### Antiphlogistine

relieves local congestion, and breaks down a vascular stasis. It causes an inhibition of the sensory nerves, thus relieving pain by acting through the thermal nerves of the skin.

Antiphlogistine is an analgesic, depletant and supportant measure for inflammatory conditions associated with pain and discomfort.

> Antiphlogistine retains its heat for from twelve to twenty-four hours, thus obviating the necessity for frequent changes occasioned by other forms of poultices.

### Babies and Growing Children

### Čan Take This Food Iron

OST babies are anomic because their mothers are anomic Bottle fed infants, in particular, are almost certain to be anomic, because cows' milk contains only one third as much iron as does human milk

Growing children are usually deficient in hemoglobin, because the regular diet of white bread, milk, potatoes, cane sugar and sim lar foods, is lacking in iron

Physiologists have long known that the best from for blood building is to be found in the green leaf of certain vegetables associated with chlorophyll, but the difficulty is to get children and adults to eat the necessary large bulk of vegetables and greens to supply the body needs of hemoglobin

These difficulties have been overcome by concentrating the soluble substance of a mixture of greens into a food iron known

### Food Ferrin

Both children and adults can take this food concentrate readily, because it is devoid of objectionable taste, does not disturb but aids digestion, does not injure the teeth, and does not cause constipation

So that you can make a clinical test of Food Ferrin, we would like to send you a physicians' sample with our compliments. The coupon is for your convenience.

# Cheplin's B. ACIDOPHILUS MILK

Approved by the A. M. A. Council on Pharmacy and Chemistry

There is only one way of convincing you just how reliable Cheplin's really is—and that is a trial in your next case of:

### Chronic Constipation or Mucous Colitis

Cheplin's B. Acidophilus is cultivated in milk, its best Medium (owing to the presence of 5% lactose), and this, combined with the careful selection of each strain of seed, produces a maximum concentration of viable B. Acidophilus. Hence, maximum results!

For additional information send your name and address for a reprint from the Boston Medical and Surgical Journal on the Acidophulus therapy together with SAMPLE and name of DISTRIBUTING DAIRY in your city.

CHEPLIN BIOLOGICAL LABORATORIES, Inc. Syracuse, N. Y.

in

### Difficult Feeding Cases

In difficult feeding cases commonly known as Marasmus or Malnutrition, the first thought of the attending physician is an immediate gain in weight, and then to so arrange the diet that this initial gain will be sustained and progressive gain be established.

Every few ounces gained means progress not only in the upward swing of the weight curve, but in digestive capacity in thus clearing the way for an increasing intake of food material.

As a starting point to carry out this entirely rational idea, the following formula is suggested:

Mellin's Food . . . 8 level tablespoonfuls Skimmed Milk . . . 9 fluidounces Water . . . . . . . . . 15 fluidounces

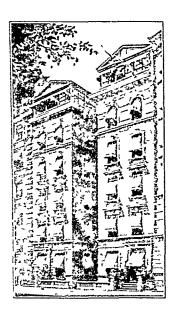

This mixture furnishes 56.6 grams of carbohydrates in a form readily assimilated and thus quickly available for creating and sustaining heat and energy. The mixture supplies 15.5 grams of proteins for depleted tissues and new growth, together with 4.3 grams of mineral salts which are necessary in all metabolic processes. These food elements are to be increased in quantity and in amount of intake as rapidly as continued improvement is shown and ability to take additional nourishment is indicated.

A pamphlet devoted exclusively to this subject and a liberal supply of samples of Mellin's Food will be sent to physicians upon their request.

Mellin's Food Company

Boston, Mass.

### For Alcoholism and Drug Addiction

Provides a definite elimination treatment which obliterates craving for alcohol and drugs, including the various groups of hypnotics and sedatives.

Physicians are invited to be in attendance on their patients. Complete bedside histories are kept.

### MENTAL SYMPTOMS AMONG BRAIN TUMOR PATIENTS, AND BRAIN TUMORS AMONG THE INSANE+

By LEO M DAVIDOFF, MD, NEW YORK, N Y

RACTICALLY all patients with brain tumors show a certain degree of mental impairment in the form of apathy, defective attention and concentration, dullness of intellect, and slowness of response later stages, dementia, drowsiness, stupor, and coma supervene Baruk<sup>1</sup> in a study of 55 cases concludes that the most important factor in mental disturbances of patients with brain tumor is the accompanying increased intracranial pressure. He must have reference to the general changes in the state of consciousness and attention just mentioned, for in cerebellar tumors in which the increase in pressure is greatest, psychotic manifestations other than apathy, drowsmess, and the like are least apt to occur Contrariwise, tumors of the frontal or temporal lobes and the corpus callosum are often accompanied by affective changes, memory disturbances, hallucinations, speech defects, even moral perversions, and may still be producing relatively little increased intracranial pressure

The cerebral location of neoplasms most frequently causing psychotic symptoms is undoubtedly the frontal lobes The character of these changes is often too subtle to be recognized by the family of the patient and by the physician who fails to evaluate the condition from a psychiatric angle. It may consist of an alteration in temperament and disposition Vincent13 and Puusepp11 emphasize a lack of interest, a want of judgment and sense of proportion, a loss of the sense of responsibility, and a defective memory. Some impairment of emotional control, and notably an mappropriate hilarity, is a peculiar feature which characterizes certain cases, the patient's speech may be foolish and silly A general lowering of the moral standard is not infrequent Not uncommonly, also, there is a blunting of the mental faculties amounting, in

some cases, to a dementia, while in others well-defined psychoses may develop Schwab<sup>12</sup> is particularly impressed by the changes in personality a concept which obviously is in itself difficult to define

Courville<sup>2</sup> demonstrated that auditory hallucinations, although infrequent in cases with brain tumors, when they do occur are associated with either frontal or temporal neoplasms. Those associated with temporal lobe tumors are usually accompanied by hallucinations of sight, smell, and taste, as well as other mental changes, while in the cases of frontal growths the various features of the mental picture are not hallucinatory.

Ikutaro<sup>†</sup> as well as Kubitcheki<sup>o</sup> feel that mental symptoms are neither frequent nor specific in patients with frontal lobe tumors Conversely, in the presence of other symptoms, a history of early development of mental changes is very suggestive of a frontal location of the growth

With neoplasms of the temporal lobes, mental symptoms are quite common and usually differ from those found with frontal lobe lesions Kolodny thinks that memory defects, while occurring later are more common than with frontal tumors These defects in temporal tumor cases involve the memory for both recent and past events, unlike the frontal lobe cases in which memory for recent events only is lost. The memory defect is more frequently associated with left than with rightsided temporal tumors,-possibly because memory is in part dependent upon the intactness of auditory and visual impressions, which sufter in a disruption of the sensory component of the speech mechanism. Other disturbances of psychic function are uninfluenced by a right or left-sided localization of temporal tumors These changes, as in the case of frontal tumors, are in temperament and personality The patients may be euphoric or melancholic, eventually silly and childish

Among the other mental symptoms in con-

From the Dejartment of Neurosurgery New York Neurological Institute, and the Department of Neurojathology New York State Psychiatric Institute

nection with temporal lobe tumors is that of visual hallucinations which, if prominent, may mislead the psychiatrically-minded neurologist. Horrax found this present in seventeen. out of seventy-two temporal lobe tumor cases. In twelve they were of a formed character, while in five, of a more simple nature. Cushing3 is of the opinion that these hallucinations are due to irritation by the tumor of the optic radiations, since the hallucinatory visions appear on the blind side of the field if a hemianopia is present. The hallucinations may, neverthelss, be present without demonstrable visual field defects and may, indeed, precede such defects by a considerable period. Contrary to the complex images of temporal lobe hallucinations, those accompanying occipital tumors are usually simple flashes of light or The formed visions, although quite complicated in certain cases, characteristically repeat themselves in every detail. Thus I recall a lady who saw very vividly pass before her eyes a gentleman dressed in mid-nineteenth century costume, carrying a cane and This vision was treleading a white dog. quently repeated. At other times, she saw very beautiful flowers, red roses opening from buds into full bloom. Another woman, less classically minded, perhaps, saw a series of horses' heads and on other occasions, big yellow flies arranged in checker-board fashion. The important point about these patients is, however, that they usually have perfect insight, and are fully aware that these visions, natural and vivid as they may be to them, are, nevertheless, creations of the mind, or perhaps more correctly of disturbed cerebral function.

Another symptom of temporal lobe tumors which may lead the patient to be suspected of suffering from a disease of the mind, is the strange intellectual "dreamy state,"-or "voluminous state" as Hughlings Jackson called it. A patient of Dr. Foster Kennedy<sup>8</sup> graphically described a typical dreamy state as follows: "An overpowering sensation as if I am going into a sound slumber . . . a kind of dreaminess . . . I feel prostrate . . . I know where I am but my feelings seem unreal: a far away unearthly feeling . . . I know that I am myself all the time, neither I myself nor the things around me are changed, but the relationship between them and me is altered. I do not think I can speak in these attacks. I was in one when Sister came round a little while ago: I knew she was near but I could not take the medicine; I could not explain to her why I could not take it. I do not think I can move in these attacks.

"Sometimes there is a kind of buzzing, whirring sound, which seems unreal though not

far off. I do not take any interest in things, though I am aware of them. I always try to find out what the attack is like; I am sufficiently conscious to try to remember what I am experiencing in order to tell the doctors about it. Nearly always there is a terrible sensation of fear; I am aware that there is nothing to be afraid of; but the feeling of pure fear is as bad and horrible as it was at first. (A reference to previous attacks.)

"This fear is not associated with any object or person whatever,—I know everything is all right but nevertheless this dread (of nothing) persists during practically the whole attack."

These phenomena, however, seldom appear alone; they usually accompany another manifestation, the so-called uncinate spell which consists of hallucinations of taste or smell. Characteristically, the odor is disagreeable, the taste, metallic, although sour, sweet, bitter tastes have often been described. The spell may be an aura preceding a generalized convulsion or may be followed simply by the dreamy state. In any case, the signs are those of organic brain disease localized in the temporal lobes.

In cases of tumor of the corpus callosum, the psychic changes may not be characteristic of the location of the disease, but apraxia, if typical, and recognized, may be very valuable in diagnosis. Thus, one case recently described was that of a patient who was treated as insane because he frequently urinated in his dishes after eating, and tried to put his legs into the sleeves of his dressing gown as if it were a pair of trousers. But at autopsy, he proved to have a glioma of the corpus callosum.

Viewing the situation from the opposite point of view, namely the occurrence of brain tumors among mental hospital patients, one finds in the statistical reports from the New York State hospitals for the insane, for the past five years, an average of less than 0.5 of one per cent of patients clinically diagnosed as brain tumor cases. Of the brain specimens at the New York State Psychiatric Institute about six per cent are those of brain tumors. Other estimates of the frequency of brain tumors among insane patients by Blackburn, Knapp, Fischer, and Leubensher vary from 0.21 to 1.7 per cent.

This small percentage of patients with brain tumors is nevertheless an important one since it represents a group which is increasingly more successfully treated if surgical means are applied. The great difficulty lies in the recognitions of the presence of tumor in such patients because so frequently the mental picture overshadows any other irdications of

the disease, and often, owing to the lack of cooperation on the part of the patient, these

other signs are difficult to disclose.

Of course, the very fact that so few brain tumors occur among psychotics is in itself evidence that tumors are not among the important causative agents of recognized types of psychoses. It would seem more likely that such psychoses in individuals with brain tumors are often not directly associated with the growths except in so far as they act as physical strains instrumental in precipitating psychoses in psychopathic persons.

Howsoever the mental symptoms may be related to the neoplasm, it is nevertheless true that the small number of patients suffering from tumor of the brain mentioned above become patients in hospitals for the insane. In going over the histories of such patients in the records of the New York State hospitals, I found that they practically all belonged to either one of two types: namely, those who slowly develop mental deterioration unaccompanied by any outstanding organic neurological abnormalities, and those who quite suddenly pass from apparent good health into a state of stupor or even coma, mental irresponsibility, and incontinence, and who show evidence of widespread cerebral and meningeal disease or irritation. The former eventually prove to have slow-growing, usually meningeal, tumors, and the latter, rapidlygrowing gliomas, most commonly, gliablastoma (spongioblastoma) multiforme.

A slowly growing meningioma of the frontal lobe may increase so gradually that the brain will adjust itself to the limited space within the cranial cavity and in spite of the very considerable dimensions reached by the tumor, no obvious evidence of intracranial expansion will result. Meanwhile, the constant pressure upon, with the consequent atrophy of, the frontal lobe or lobes, gradually produces deterioration of memory, judgment, attention, and the personality in general, leading the patient to a psychiatrist. Frequently, such a patient is hospitalized for years, classified as suffering from an incurable mental degeneration based, perhaps, upon some unknown organic cerebral disease, and not until autopsy is the tumor discovered,-a tumor often attaining a weight of one, two, or even three hundred grams.

There are twenty meningiomas, removed at autopsy from psychotic patients, in the collection of the New York State Psychiatric Institute. About one-third of them are the large growths arising probably from the olfactory groove that were associated with symptoms principally psychic. The neurological symptoms were usually absent, or so far in the

background that they were almost regularly missed, especially when the patient resisted examination, and the examiner's slant was chiefly psychiatric rather than neurological.

An excellent example of such an instance

is the following:

P. Z. a white Lithuanian woman, Brooklyn State Hospital No. 28745, vol. 577. New York State Psychiatric Institute autopsy No. 1098. Admitted: September 29, 1921.

F.H.: Unknown.

P.H.: Nothing known of early life except that she was born in Lithuania and came to the U. S. fifteen years ago; married fourteen years ago; had three children, two of whom are now living. Patient was described as a good housewife.

Makeup: Poorly defined. No unusual traits

admitted.

Previous attacks: None

Psychosis: Duration, one year and six months. beginning three months prior to the birth of last child. During the latter months of pregnancy she complained of headache and some failure of eyesight as well stomach as trouble. Physicians in attendance spoke of kidney trouble associated with the pregnanacy which secondarily affected the eyes. She received at that time injections of some drug, one daily, on twelve successive days. Gradually she became indifferent, lost interest in the care of her household and children and in her own personal appearance. She slept a great deal and complained of feeling weak.

P.E.: A well-nourished, even obese, woman, but showing no other definite endocrine changes. There were "no cranial nerve disturbances" other than the subjective complaint of poor vision. The pupils were equal and reacted well to light. The deep reflexes were somewhat sluggish but equal. There was no

Babinski,

Mentally: She was extremely dull and indifferent, presenting a picture of advanced mental deterioration. No hallucinations or trends were evident. She was discharged after three weeks, against advice,

Readmission: April 22, 1922.

Interval History: At home she showed no change in her condition, but complained of headaches and some dizziness. At times, she was somewhat depressed but mainly her mental condition was characterized by extreme dullness. The readmission became imperative after she wandered out into the street scantily clad, carrying her naked baby in her arms.

Reexamination: Her physical and mental states were essentially the same as at her previous

hospitalization.

Course: Her condition remained unchanged for about six weeks. Then she suddenly had a fainting spell after which she was kept in bed. She became extremely apathetic, but could be aroused sufficiently to give halfhearted replies to questions. She did not cooperate in any systemic examination, however.

The only notable evidence of organic neuropathology was the development of an involuntary oscillatory movement of the head, accompanied by tremors of the arms. "Examination of the eyegrounds could not be satisfactorily done on account of her resistiveness."

Gradually she passed into a stupor from which she could not be aroused, and died June 13, 1922.

Autopsy: Nothing of any note in any organ except the brain. This showed a moderate-sized meningeal tumor (about 100 gms) arising from the cribriform plate, spreading apart the two frontal lobes, but indenting especially the left one—which was atrophied to a shell only two to three cm. in thickness. (Fig. 1), (Fig. 2).

FIGURE 1

The tumor in situ, showing the large size of the tumor, its encapsulated character, and the displacement of the brain by it.

Several points about this case combined to mislead the physicians in charge. In the first place, the history of headaches associated with dimness of vision occurring for the first time during pregnancy naturally led them to assume

that these were manifestations of threatened eclampsia, the dangers of which were past

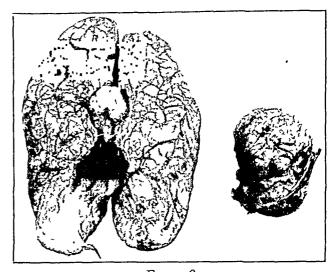

Figure 2

The tumor shelled out of its cerebral bed, showing the marked atrophy of the left frontal lobe.

with the birth of the child. The language difficulty, as well as the lack of cooperation on the part of the patient precluded an olfactory examination,—even had it been considered,—which would have been of undoubted value. Even a satisfactory examination of the fundi oculi, which would certainly have shown at least some atrophy, was too difficult to carry out. X-ray examination would unquestionably have been of aid. Finally, the possibility of this being a case of brain tumor was not sufficiently stressed so that failing ordinary measures some more drastic diangostic procedures such as ventriculograms were not considered.

State hospital experience with cases of tumor of the glioma group is more precipitous and dramatic. This is especially true of cases of gliablastoma (spongioblastoma) multiforme. These tumors sometimes grow so rapidly that they provoke acute mental symptoms resembling delirium and other toxic encephalitic manifestations. This frequently amounts to a complete dementia. The patient shouts, hallucinates actively, is resistive, pugnacious, incontient of both urine and feces. In a recent paper4 mention is made of three patients of this sort previously apparently well who were picked up in the streets wandering aimlessly, improperly clad, confused, disoriented, and unruly, presenting acute social problems. These tumors, moreover, tend to occur most frequently in the left temporal lobe and the resulting speech disturbances simply add to the apparent disintegration of the individual. Such uncontrollable states may alternate with periods of stupor, even coma.

Unlike the cases of the first variety, these patients present a confusion of abnormal organic neurological signs in addition to the mental changes which make the diagnosis difficult to distinguish from acute encephalitis. Such patients seldom present histories of longer than four months. Elsberg and Globus<sup>5</sup> refer to this type as "acute brain tumor." They call attention to the suddenness of the onset which is often, according to them, . . . "apoplectiform, with sudden dizziness followed by loss of power in one or more of the extremities. If the symptoms began without headache, severe pain in the head soon appeared and persisted until the patients became stuporous or comatose,

"Most of the patients looked acutely ill, and many of them appeared 'toxic' as though severly poisoned by the disease. At first this frequently led to the suspicion that one was dealing with an inflammatory lesion, and the first examination revealed many signs which are often found in encephalitis.

"When the patients were first seen, rigidity of the neck and a Kernig sign, a more or less well-marked papilledema, inequality of the pupils and a state of drowsiness or a state of stupor were often present. Not rarely, ptosis, unilateral facial paresis and paralysis of one limb or the limbs on one side were found.

"With these signs, alterations of the tendon reflexes in the affected limbs with a Babinski sign and other evidence of motor involvement were almost regularly present, and in the patients who were able to cooperate, sensory disturbances were noted.

"Tenderness on percussion of the skull on the side of the tumor was observed decidedly more often than is usual in tumors of the brain."

This picture, together with the mental confusion, disorientation, stupor and complete disintegration of personality, is so suggestive of a generalized disease of the central nervous system that localizing signs are often discounted, and in their absence, no effort by ventriculography or ventricular estimation is The error in these circumstances is based on the exact antithesis of the state of things in the first group of cases. There, the slow expansion of the growth permits its accommodation in the skull with so few disturbances that even a large neoplasm can be clinically overlooked; here, the tumor expands so rapidly that even distant parts of the brain show secondary effects as a consequence of pressure which results in a malady so generalized that an examiner may feel that it cannot be explained on the basis of a localized lesion.

#### COMMENT

Most recognized brain tumor cases exhibit some psychopathology which, if analyzed by the neurologist and neurosurgeon, might give some suggestion as to the localization of the growth.

On the other hand, a certain small percentage of psychotic patients are suffering, undiagnosed, from cerebral tumors which could probably be recognized if the psychiatrist would keep in mind the possibility of such a lesion.

These patients may be divided into two groups, (1) Those with slowly developing symptoms chiefly of mental deterioration and few neurological signs, and (2) Those with a profusion of neurological signs in addition to a rapidly disintegrating mentality. The first group usually have slowly-growing tumors, meningiomas, for the most part. The second group prove to have rapidly-growing gliomas, -chiefly gliablastoma (spongioblastoma) multoforme. The diagnosis of tumor in the first group is often missed for lack of investigation of inconspicuous signs; in the second, for failure properly to evaluate the many obvious signs that present themselves.

## THE DIAGNOSIS AND TREATMENT OF CARCINOMA OF THE BREAST\*

By WILLIAM CRAWFORD WHITE, M.D., NEW YORK, N. Y..

EARLY WARNINGS OF GROWTH

**TUMORS** of the breast, unfortunately, are rarely accompanied by pain. If only we had the same warning as occurs with a tooth abscess, how much more often we would see the cases early. Occasionally, the patient complains of a vague distress or "drawing" pain, but after careful investigation, I believe that it is almost entirely a matter of second thought; -after the tumor has been discovered through some other cause. Usually, the patient accidentally feels a lump in the breast while bathing. So often does the patient volunteer this information, that one looks for this story. In accordance with the degree of education of the patient depends the speed with which the woman goes to her physician for advice.

Another warning is the bloody discharge from the nipple. We see nipples that have a very slight serous discharge, enough to make an occasional stain on the underwear. We also see an occasional breast that exudes a drop of milk in non-lactating breast. These latter two are not significant of tumor. I have never seen any tumor develop with such symptoms. On the contrary, a bloody discharge is very significant in the non-lactating breast. It indicates a papillary growth in the ducts, and this is a tumor growth which is often not palpable.

Brawny Localized Edema of the skin is an indication of growth in the breast. It is due to obstruction to the lymph channels, which run out vertically to the skin from the neoplasm. This area may be one inch or several inches in diameter. In an obese breast with the tumor well away from the nipple, nothing else abnormal may be noted except this localized brawny edema.

Persistent Ulcer of the Nipple of the chronic type in a non-lactating breast, is very suggestive of tumor growth in the ducts, with secondary extension to the nipple and necrosis. Syphilis should always be eliminated. This is commonly called Paget's disease of the nipple. But this rightfully is a disease of the ducts with early extension to the nipple.

Length of Time: that the mass has been noticed is of very little help. The history is not dependable. Also one must remember that a nodule may be malignant and of very slow growth. A story of a tumor that began to increase in size after a long period of quiescense is very suggestive. Tumors in the breast appear after adolescense. The benign adenomas are often seen in the late "teens," or early "twenties;" the cystic changes usually in the late twenties and

later most commonly in the general period of the menopause. The papillary growths, the carcinomas, and the sarcomas rarely appear before 25. However, with our increasing knowledge of malignancy it can not be used as an absolute rule that no malignancy appears before 25 years of age. Too many cases of carcinoma have been seen in younger people, to make such a hard and fast rule.

In the factor of *Trauma*, one must remember that it is a common mental process, to imagine a cause after a tumor appears. One is told of some bump against a bed post or door, or of some accidental blow a month or a week before. When the trauma is sudden, and severe enough to cause hemorrhage with hematoma, then, we can well relate the effect and cause. Such patients have sufficient evidence otherwise. But I am talking of the usual case. I have never been able to convince myself that there is any relationship between acute trauma and new growth of the breast.

There is no indication that one breast is more involved than the other. I have not convinced myself that marriage, pregnancy or lactation are definite factors in the etiology of tumor. Frank Adair, of the Memorial Hospital, New York, has studied the incidence of carcinoma of the breast to nursing after pregnancy. He feels that there is a tendency for the women who lactate and nurse over some months, to have less carcinoma. His work is interesting and suggestive, but until well confirmed, it should be taken with a "grain of salt."

Infection in the form of a history of old caked breast or abscess with incision has not been a factor. It is surprising to see how uniformly one sees malignant breasts without any such history, and on the other side, one sees so many abscessess of the breast which never have developed malignancy. Infected breasts at lactation are frequent enough to cause a large total of cases, and if they had been a factor, the relationship would long since have been discovered.

## LATE SIGNS OF CARCINOMA

- 1. Large masses that may cause one breast to be larger than the other, with distortion as it hangs down. In this condition, the mass is usually attached to the skin and to the muscles so that it becomes fixed.
- 2. The skin over the mass takes on a pigskin or orange peel induration. The skin loses its natural laxity and feels thick and hard at this site. It can not be moved independently of the tumor mass.
  - 3. The nipple loses its erectile properties, and

<sup>\*</sup> Read before the Queensboro Surgical Society, November 19, 1928.

becomes inverted to some degree. Care must be taken to compare this nipple with its neighbor and also to satisfy oneself that the condition is not an old deformity.

4. Palpable axillary lymph nodes in the adjacent axilla. These are discreet, hard and movable. They are not tender, and there is no indication of soft tissue involvement about them. The most frequent site in which they are palpated is along the lower border of the pectoralis major. Feel up toward the apex of the axilla with the palm anterior and the fingers at the apex. Such hard lymph nodes are very suggestive, but do not jump to a conclusion. One must differentiate from hyperplasia as a result of chronic irritation, subacute pyogenic infection, and tuberculosis. Hyperplasia is characterized by soft nodes which are usually discreet. Pyogenic lymph nodes involve the adjacent tissue and do not move freely. They also are tender. Tuberculous lymph nodes when small feel like malignant nodes; when large they feel like pyogenic glands. They differ from the latter, in that they are free from tenderness and pain. The above description will hold for many cases. In many other cases, there is no definite diagnosis until the lymph nodes are removed and examined. I have many times seen large hyperplastic or tuberculous glands associated with carcinoma of the breast. And before operation we have usually made an erroneous diagnosis of metastases to the axillary lymph nodes.

#### HISTORY AND EXAMINATION

It is our custom to follow a definite routine in the examination of the breast case. We have a history and physical which have been dictated and typewritten. In addition we have a check sheet to be attached to the history. This is of such a size that it may be included with the rest of the hospital record, or it may be folded and filled with other breast records. I find that either alone is incomplete. The check sheet is invaluable.

It is so easy in the history to forget some important points that would be sadly missed in collected statistics later.

The breasts should be inspected and palpated with patient erect, and reclining. As a routine, one must examine and compare both breasts, both axilla and both superaclavicular spaces. The lower edge of the liver should be palpated.

Inspection: With normal breasts the anatomy is bilateral. With tumors, often one breast is larger than the other. If the mass is of any size, irregularity in the contour of the breast may be noted. The irregularity takes the form of a depression of the skin over the mass. The nipples must be observed to see if there is any inversion But one must not be led to a hurried conclusion. A careful history must eliminate the possibility

of old deformity. And at that, there is also to be remembered that some women have never noted their deformity of the nipples. Until I began to appreciate this fact, I had been led into false preoperative diagnosis.

The inspection of the supraclavicular spaces is very important. Often the early metastatic involvement of the supraclavicular space can be detected by increased fullness. Note if there is any edema, pigskin appearance, or redness of the breast. Note if these are localized or diffuse.

With a powerful light in a dark room, transilluminate the breast. Dr. Max Cutler<sup>8</sup> has developed this technic in conjunction with the Cameron Company. If the mass is solid, one has a dense opaque shadow. If the tumor is a cyst or there is a cystic mass, there will be much better transillumination. This diagnostic aid is recent but should be of value.

Palpation of the breasts should be made with the palm of the hand held flatly against the breast. If the fold of the breast is held between the thumb and fingers or between the two hands, phantom tumors will be felt. I can not too strongly stress the value of the flat hand palpation. This should be made with the patient erect and also reclining. In the latter position, palpate with the arm at the side and then in 90 degrees abduction. When the arm is abducted one can more readily determine if there is any attachment to the pectoralis major. Also, in abduction some of the lymph nodes under the lower border of the pectoralis major may be more readily palpated, if enlarged,

By palpation one determines if there is one or more nodules. Also determine if the lump is soft or hard; smooth or irregular; fixed or movable; tender or not; attached to the superficial or deep tissue; attached to the nipple. Also when the axilla and the supraclavicular space is examined for enlarged lymph nodes, feel when the part is in relaxation. The nodes may then be more readily found. The hyperplastic lymph nodes feels soft and discreet. The tuberculous node is soft and discreet when small, but becomes adherent to adjacent nodes when it becomes large. It is still soft. nodes that have only partly been invaded the feeling is the same as with the hyperplastic. When carcinoma has extensively involved the lymph node, it feels hard.

#### PATHOLOGY

Tumors of the breast may be divided, pathologically into the benign and the malignant.

The benign tumors are the fibroadenomathe galactocele, the blue domed cyst, the multiple cystic mass (so cystic mastitis) the papillary

Fibroadenomas vary in the relative proportion of fibrous tissue and glandular cells. variations have been given different names, but as they are all essentially the same, a simple name to cover the group is sufficient. In the breast, one has a lump that is freely movable beneath the skin and is not attached to the deep tissue. In most cases it has a definite capsule from which the tumor may be shelled out. Less frequently it may not be shelled out. At the same time it is definitely localized and has a capsule. At times, especially when large, it is edematous and attached to the superficial tissue. A biopsy and quick section will demonstrate, however, that this is a benign condition and not sarcoma. It is well to remember that when the mass does not shell out, one is approaching the border line case.

The Galactocele is a cyst filled with milk. It has a smooth wall and is well circumscribed. It is related to a breast that had lactated.

Chronic cystic mastitis is a cystic condition of the breast that may manifest itself through one large cyst and a few small ones, localized about it in one portion of the breast. From this stage we have many gradations up to a diffuse involvement of the breast with many sized cysts. These cysts contain clear yellow serum, a dark brown fluid with cellular detritis in it; a comedo like exudate; or combinations of all three. In this type the walls are thin with a glistening surface.

Papillary cysts are characterized by a growth from the lining of the cysts. This varies from a sessile growth to a tree-like arrangement with branches. Usually this is associated with an old bloody exudate in the cyst. The papillary formations are not necessarily confined to the cysts. Careful section usually will demonstrate papillæ in the neighboring acini and alve-With the microscopic sections of the entire breast as developed and perfected by Sir Lenthal Cheatle, one may see all stages of papillary formation in the same breast. It is obvious that the bloody exudate from a nipple can not come from a cyst. Such an exudate comes from papillary growth in dilated ducts or acini. This type has not penetrated the elastic membrane of the acini or alveoli to enter the surrounding tissue.

Lipoma is a fat tumor that is similar to that found in any other part of the body. When present it is usually found on the periphery of the breast. It is infrequent.

Tuberculosis of the breast is rare, but occurs often enough to warrant preparedness to diagnose the condition. The cases that I have seen have been in the central portion of the breast. The mass has had an irregular contour with pigskin area of skin over the mass to which it

Sometimes there is slight retracwas fixed. tion of the nipple, and again there may be a story of discharge from the nipple of a milklike substance. It is painless, slow in growth and not necessarily associated with pulmonary tuberculosis. Lee and Adair have described an odd condition that they have observed in obese women. They call the mass "Traumatic Fat Necrosis," and it looks enough like carcinoma to require a careful differentiation. This mass occurs in obese breasts in older women who have had a severe trauma to the breast, such as hypodermocylsis, enough usually to When seen, months or cause ecchymosis. years after the injury, the patient presents herself with a painless lump. It is well defined and often adherent to the skin. One case had marked adherence to the skin so that it could easily be observed when the breast was raised. At operation a small cystic mass is This has a hard wall with a shaggy chocolate rough lining. The contents are semifluid with a yellowish granular material. Microscopic examination shows necrotic fatty material with many giant cells. There is a chronic inflammatory tissue about this. Lee and Adair have reported five cases and quote Bloodgood The diagnosis was only as having seen two. made once before operation, and so one must depend on a quick section by the pathologist at operation.

### SURGERY

"The efficiency of an operation is measured truer in the terms of local recurrence than of ultimate cure."

In the history of surgery of cancer of the breast, one sees steady progress. In the time of H. B. Sands, the surgeon operated with little or no idea of cure. Sands never had a three year cure. His operation was a simple Under the influence of Volkmastectomy. mann, the routine excision of the axillary lymph nodes as well, became the practice. This reduced the growth of axillary glands. Then in 1882 Halsted<sup>3</sup> commenced the routine operation of removing the breast, thoracic portion of the pectoralis major, and the axillary glands. He left a raw wound which he usually skin grafted at the same operation. Under this treatment he had a marked reduction of local recurrence. His results were excellent, especially when one remembers that in the first ten years of this surgery, he rarely operated upon a case that did not have axillary metastases. Halsted carried his incision directly down through the skin to the muscle. The next advance in technic is due to Sampson Handley, who showed that early carcinoma of the breast spread in the subcutaneous fascia. So he propounded the theory that if one should take out the same or even less skin than Halsted removed,

and in addition dissected out the subcutaneous area an additional radius of 2 to 3 inches, he would have less local recurrence. And his proposal has been justified in better results than those obtained by Halsted.

It is my practice to cut the skin so that a radius two and one half inches from the tumor Then I make a subcutaneous dissection out an additional two and one half inches beneath the skin. The incision is then carried down through the thoracic portion of the pectoralis major, including the upper part of the sheath of the corresponding rectus abdominus muscle The P minor is also re-This is advisable for metastasis are moved sometimes found between the two pectoral muscles, lying on the pectoralis minor. Also it gives one better exposure for a thorough dissection of the avillary contents It has been said that "the man who closes the wound should not be the man who makes it" After all we are dealing with a terribly serious disease and we should not be prevented from doing a worthwhile job. Fortunately in most of the cases the skin may be approximated The tension at operation often is more appar ent than real. In some, especially the thin cliested with small breasts, one must necessarily do an immediate Thiersch graft The grafted area is unsightly, but skin grafts in such cases have the advantage that they allow more use of the arm It is our practice to remove the mass in one piece, and we usually proceed from without inward. Yet we do not feel that the direction is of much moment, as we have often removed them from within outward Halsted was enthusiastic for supraclavicular dissection and at one time went so far as to divide the clavicle in his zeal to remove all the lymph nodes Halstead found supraclavicular metastases frequently in cases with only midaxillary glandular involvement. While I do not condemn the supraclavicular operation, I have not practised it, chiefly, because I have felt that a case with supraclavicular glandular involvement was beyond a surgical cure

I am accustomed to use a one-fourth inch tube drainage through the scar in three or four places and a stab wound availary drain with a three eights inch tube. The scar drains are removed the next day and the availlary drain about the third dry. Dry dressings are applied to the wound. The upper extremity is left free

There are many varieties of skin incision One must vary the incision with the site of growth. The important point is to go sufficiently wide of the tumor. In the old Halsted incision, the wound was carried out on to the arm, but later on he carried his incision only up to a point two or three centimeters below the clavicle. He had felt that the longer in-

cision did not allow a better exposure and possibly was a large factor in causing post operative edema of the arm

#### RADIATION

Enough information has been gathered to draw the conclusion that radiation after operation has given an increased average of length of life after operation Greenough has found that his cases had an increase of about nine X-ray therapy is still to a certain de gree in an experimental stage At first low voltage was employed and then under German influence, the massive high voltage, up to 200 -000 volts, came into popularity The results were not as good as the first reports might indicate, but the massive dosage has not been applied long enough to draw any final conclusions Another school is still persisting in the use of repeated treatments with small doses. They too have not had a long enough experience or wide enough experience to prove their case. I have seen local recurrences with both types of treatment. I do feel that either treatment is of value, and that, for the present, the machine at hand must be thoroughly tried out. In the local recurrences or the metastases to the pelvis or spine, 1-ray therapy is indicated. Often a combination of radium packs and Roentgen radiation in alternation has proved effective, temporarily checking the progress of the disease. Many cases of severe pain associated with metastases to the spine or pelvis have had temporary relief from pain and comparatievly good health for months

I feel that Roentgen radiation before opera tion is not indicated. Its advantages are theoretical. In practice it is well nigh impossible to persuade the patient to wait the necessary four to six weeks for the operative stage. Most of my patients insist on an operation as soon as possible, but one has no difficulty in persuading post operative therapy. This can be given in visits to the office of the therapist, or at most, a few days stay in the hospital With expert care, one does not now see disasters with radiation that formerly were not uncommon I admit, however, that one still sees oc casional cases of nausea and vomiting after high voltage therapy, but rarely is this more than a temporary upset. In 1927, I' investi gated the results of moderately radical surgery of the breast at the Roosevelt Hospital You will note that in 157 cases of all operative types, 36 per cent were alive and well at the end of five years. In a group of 61 cases followed for ten years, 24 per cent were alive and well at the end of that period. If one examines the cases that came to us so early that no axillary metastases were found, you will note that 70 per cent were alive at the end of five years.

and that 57 per cent were alive at the end of ten years.

## Conclusions

1. All tumors of the breast deserve immediate operation. In all questionable cases, excise and do frozen sections at the time of operation. Then proceed if necessary.

2. Make the radical operation thorough.

3. Give Roentgen radiation after operation and repeat at stated intervals. The results at present are not ideal. But compared to the early days of Ilalsted and Gross, great strides are being made. Some of these are early diagnosis, more radical surgery and post-operative radiation.

# THE TREATMENT OF ARTHRITIS "RHEUMATISM" WITH SPECIAL REFERENCE TO NON-SPECIFIC PROTEIN THERAPY

By HENRY 1. SHAHON, M.D., NEW YORK, N. Y.

From the Arthritic Clinic of the Post Graduate Hospital.

ARTHRITIS, "Rheumatism," is one of the oldest diseases of which there is record. Doctor Goldthwait classifies Arthritis under two headings: (1) Chronic Infectious Arthritis, and (2) Chronic Hypertrophic Arthritis. The classification which the writer thinks is best is the following:

- (1) Infectious Arthritis.
- (2) Toxic Arthritis.
  - (a) Chronic Atrophic Arthritis.
  - (b) Chronic Hypertrophic Arthritis.

Infectious Arthritis: In this type the bacteria or the result of bacterial action are present in the joint. This condition may attack any type of individual, the slim, visceroptotic or the obese habitus. Usually but not always the onset is sudden. The condition is usually polyarticular. There is swelling, pain, limitation of motion, loss of function, and spasm followed by deformity. Often there is glandular and splenic enlargement. Secondary Anemia, slight temperature, high pulse, loss of flesh and loss of sleep are noted.

In 119 cases analyzed by Backoven, one focus of infection was found in sixty; two foci in forty; more than two foci in twenty-one, and no foci in eighteen. Pyorrhea was present in fifty-five cases, dental abscess in forty-six, gingivitis in thirty-five, tonsilitis in twenty-six, prostatitis in twelve, constipation in eight, appendicitis in six, and cholecystitis in five. Sinusitis, infected adenoid tissue, colitis and extensive dermatitis were each found in four cases.

In infectious arthritis we are dealing then with one or more foci of infection somewhere in the system. It stands to reason then that a careful history of the patient must be taken in every case.

In the family history one must search constitutional defects as are manifested by Gout, Obesity, Diabetes, Bright's Disease, Arthritis, Tuberculosis, and Syphilis.

In the personal history find whether or not there have been any past infections which might initiate a joint change or might still persist as an infective form.

In the physical examination determine if the patient is of the normal, obese, or undernourished habitus. A local examination of the affected parts will make possible a differentiation among myositis, bursitis, periarticular inflammation and inflammation within the joint itself.

In the search for focal infection we must search particularly the mucous membrane tracts, both gastro-intestinal and genito-urinary. This examination should include the para-nasal sinuses, the teeth, the tonsils, the middle ear, the gall bladder, the appendix, the coecum and colon, the kidneys, the prostate, the seminal vesicles, the uterus and the oviducts.

The most common sites of focal infection are the tonsils, teeth, sinuses and the colon. One should not forget also that the secondary foci in the neighborhood lymph glands or in the joints themselves may maintain the infection even after the original foci have been removed.

Chronic Atrophic Arthritis: The etiology of this type of arthritis is not known. This condition is polyarthritic affecting first the small joints, fingers, wrist, elbows, knees, tarsus, shoulder, jaw and spine; the hips are rarely involved. This form of arthritis occurs in young adult womenmore frequently than in men. Grief, nervous shock, physical and mental strain, are important factors.

In this type of arthritis the pain is not very severe. There is not that "Soreness" as in infectious arthritis. At first there is a boggy swelling about the joint, later atrophy. Here all the joint structures are involved—cartilage, bone, synovia, and the synovial fluid. The synovial membrane is affected early and thickens. There is erosion of the cartilage, and bony changes come late.

Hypertrophic Arthritis This type of arthritis usually occurs in clderly people It is found in firemen, teamsters, refrigerator plant workers, longshoremen, and heavy load workers, pain is usually the result of slight or severe traumit or of motion out of proportion to the ringe of the joint, as the pain disappeurs a bony enlargement is noted, also deformity and Immeness. There is limited motion, due to the proliferation of bone about the joint, later deformity occurs in all the affected joints. The hip and the knee cause more disability than do other parts. The Illberden's nodes seen in the plalangeal joints are typical

## TREATMENT OF INDICTIOUS ARTHRITIS CHRONIC ATROPHIC AND HYPERTROPHIC ARTHRITIS

The treatment of arthritis may be best considered under two headings, first the general management of the patient for the elimination of infective foci and the correction of the systemic effects of infection, and second the correction of the mechanical defects. The accomplishment of both these objectives demands a combined, vigorous attack by the interinst and the orthopedist

The attack of the internist should be directed to the arrest of the disease processes which are involved and to general restoration, that of the orthopedist, to the prevention and correction of deformities and the restoration of the injured joints to as nearly normal function as is possible

The constitutional treatment is directed to the promotion of the physiological functions which have been retarded by the toxic processes and the stimulation of the organs of the body to get iter activity. Constitutional treatment therefor, in cludes every therapeutic measure at our command whereby these objectives may be attained as diet, exercise, actinotherapy, medication non specific protein therapy, chemotherapy, and fixation of the affected joints, supplemented by massage, diath ermy, and later by passive and active exercises is they are indicated by the progress of the joints toward restored function.

Dut There is no specific diet for arthritis. If the patient's stools show marked putrefactive changes, then the protein intike is diminished and the deficit replaced by europhydrates. It on the other hand the stools show to be of the fermentative type then the curbohydrates are diminished and the protein intake increased. Alcohol is permissible. If there are any gastric disturbances they should be corrected.

From Suitable exercises are instituted to overcome the defects in bodily mechanics. The patient is fitted with a support to be worn until the abdominal muscles have regained their strength and tone and the posture is improved.

Actinotherapy Just as the Alpine lamp is beneficial in joint tul creulosis it is also of similar value in chronic arthritis Medication Medicinal therapy is mostly paliative Cinchophen, Salicylates, Arsenic, Iodides, and Alkalies are greatly used Cinchophen, Atophan, Tolysin, and Aspirin telieve a great deal the pain, but their continued use for a long period of time will act as depressants. Alkalies are of course indicated in cases with gastric irritation.

Non Specific Therapy The treatment of arthritis by the non specific proteins is still in the experimental stage, and the clinical reports are relatively few. There exist in the body non specific splitting enzymes, protein in character, that attack invading protein toxins, whether they are bacterial, animal, or vegetable. These non specific enzymes may be activated by the injection subcutaneously, intravenously or inframuscularly of various foreign proteins in proper dosage.

Betz in 1921 treated arthritis with typhoid vaccines, and obtained appreciable results, when other methods had failed

Schmidt used milk by intramuscular injection In 1910, and during 1916 many articles were written in German and Austrian publications on the use of milk for parenteral injection in the treatment of various affections, especially arthritis. The writer has used milk exclusively as the injection substance and has obtained gratifying results in most cases and good results in gonorrheal arthritis.

Cow's milk is used It is sterilized by boiling for ten minutes and subsequently cooled to a comfortable temper ture the intra muscular route is the best. The writer would not recommend the intravenous route at all

The sites of injection are the muscles of the arm, and the glute il region. All the precautions as to asepsis and avoidance of entry into the vein are taken. The initial dose for an average adult is 1/2 cc The injection is generally repeated every other day, and the dose is increased by 1/2 cc at every injection. The total number of injections required varies with the individual case and may be anywhere from ten to twenty five. Some have used 4 cc as the initial dose and increase 1 cc it each injection. The reason the writer uses 1/2 cc as the initial dosc is because he believes the chances for a severe reaction is overcome and the patient will return to the clane or the office for the subsequent injections. It is well to remem ber that the second meetion should never be given unless it can be given after an interval of less than ten days, on account of the danger of i severe constitutional reaction. When the patient has a severe constitutional reaction, the dose injected tollowing such a reaction should not be increased it all over the previous one it rarely has to be reduced. The local disturbance at the site of injection is never severe enough to in erpicitate the princit

The reaction following in interminscular mill

injection rarely comes right away. The patient is instructed to wait for a period of ten minutes hefore leaving the office or clinic. He is then told to go home and stay in bed for four to five hours. This treatment is applicable to all forms of arthritis but particularly to infectious arthritis and gonorrheal cases.

The milk injection method should not be used in patients with Asthma, Organic heart disease, Hypertension and Pregnancy. It is well to remember of course that none of these are absolutely contra-indicated, if they are used with caution by beginning with smaller doses and keep-

ing the patient in bed.

Within one to four hours following an injection of milk the patient may have a chill or chillness of varying degree of severity and varying duration. The temperature may rise to 102° or higher, and a profuse sweat may follow it. In most cases the patient experiences mild headaches. The local process in the joints is temporarily aggravated, as noted especially by increase in local pain, and less noticeably by increased red-Following the disappearance of the chill the blood picture is that of leucocytosis. has been found as high as 50,000, but usually is a good deal lower. The increase is largely in polynuclear neutrophiles. There is no eosinophilia. At the end of 24 hours the leucocytes are back to normal. The kidneys show no constant disturbance.

In conclusion there is an attempt, first, to evaluate a therapeutic procedure which some have sneered at and in others neglected, in both instances without good reasons; secondly to call attention especially to the simplicity and value of intra-muscular milk injections in all forms of arthritis, with particular emphasis on gonorrheal arthritis.

Physiotherapy: The study of capillary blood flow affords evidence that in arthritis the rate of blood flow may be more irregular and may reach lower values than the normal person seems to show. For this reason external heat is one of the most practical means of treatment. Exposing the body to an electric bake for 15 minutes at a temperature of 120° is very beneficial. The other agents that stimulate the local or systemic blood flow are: exercise, massage and .r-ray.

Chemotherapy: Jeffery, Burns, and Keith give the following report of the results which they obtained in 24 cases of arthritis treated with intravenous injections of amiodoxyl benzoate an ammonium salt of orthoidoxy benzoic acid. The usual dose is 1 gram dissolved in 100 cc. of warm normal saline. This is injected into the vein by

gravity. Not less than 10 minutes should be consumed in an injection.

The patient usually has considerable reaction during and after the injection. After about 25 cc. are used, the patient complains of tingling of the tongue. This is followed by smarting and itching in the nose and throat, bronchial irritation, conjunctivitis, pain and smarting in the joints themselves. Transitory headache is common. These symptoms usually disappear within an hour. Generally speaking, the reactions are severe enough to cause the patient real discomfort and some discontinue the treatment on account of it. In this form of treatment the most hopeful cases are those of the acute type of no long standing. Gonorrheal arthritis as a class seems to give the best results.

Occupational thereapy is a great asset and should be encouraged. Not only does it help to limber up the stiff joints, but by keeping the patient's mind off his unfortunate condition during the long days of waiting for improvement, it promotes optimism and a better moral.

## Conclusions

- (1) In the infectious arthritis the etiology is apparantly known, while in hypertrophic and atrophic arthritis the true etiology is not as yet known.
- (2) In the infectious forms of arthritis before beginning any sort of treatment it is best to remove all known foci of infection.
- (3) There is no specific treatment for arthritis as yet, but several modes of treatment have been adopted by several workers in this field with marked appreciable results. The skilled use of physiotherapeutic measures, massage, hydrotherapy, postural exercise, external heat, diathermy, chemotherapy and non-specific protein therapy, like typhoid vaccines and milk have benefitted many patients. The milk injection method is the most economical, simplest and insures in many cases marked improvement.

# ARE THERE INDICATIONS FOR OPERATIONS ON THE ADRENAL GLANDS?\* By GEORGE W CRILE, MD, CLEVELAND CLINIC, CLEVELAND, O

→ HAT the adrenal glands are concerned in all the major activities of the organism is well known Years ago in our laboratory we found that in excitation and exhaustion from any cause the cells of the adrenal, uniformly with the cells of the liver and brain, showed respectively hyperchromatism and chromatolysis, thus indicating that with the liver and the brain they are essential to the operation of the organism Reciprocally, we know that removal of the adrenals rapidly and impairment of the adrenal function more slowly produces physical changes typical of exhaustion In adrenal insufficiency from any cause, the entire organism is profoundly affec-Riesman has called attention to the occurrence of acute adrenal insufficiency in soldiers, especially in those who, prior to the war, had led a sedentary life. The appearance of this syndrome in these exhausted soldiers is well explained by our histological findings

We have further evidence of the validity of the conclusion that the adrenal glands play an essential role in the physical and chemical activity of the cells of the organism in other experimental findings in cases in which adrenal insufficiency is produced by the removal of the adrenal glands or by the division of their nerve supply. In animals, after the removal of both adrenal glands, the electric potential, which is a measure of vitality or the power to do work, falls, and the electric conductivity, which measures the facility with which work can be done, decreases Thus, temperature, oxygen consumption, electric conductivity, electric potential-all of which can be measured accurately in the laboratory-are affected by adrenal insufficiency.

This fact assigns to the adrenal glands a fundamental and basic function in the organ ism. How the loss of this basic function affects the work of certain other organs is well shown in Addison's Disease That the brain is profoundly affected is shown by the loss of emotional and mental activity, lethargy, and by the depression of normal response and re-The voluntary muscular system is weak and depressed, the victim in advanced stages being unable to walk, the involuntary muscular system and its innervation is also profoundly depressed since the heart and blood vessels are unable to maint un-i normal blood pressure. The activity of the entire sympathetic, involuntary muscle, and glandular elements of the digestive system is depressed, for appetite is lost and digestion is sluggish. That the liver is pro-

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N Y, June 1930

foundly affected is shown by the cytologic changes in its cells. The skin becomes mactive, the special senses lose their acuity

Thus, when the function of the adrenal glands is depressed, the activity of the entire organism is correspondingly decreased, and no therapeutic measure, other than the use of the recently isolated cortical hormone not even the administration of thy roid extract is of avail. By means of the hormone which they isolated from the adrenal cortex Stewart and Rogoff and Hartman and his coworkers have been able to prolong the lives of adrenalectomized animals.

Let us now turn to the opposite side of the picture and consider the effects of hyperac

tivity of the nerve-adrenal system

In a state of pathologic emotional or nervous excitation such as leads to recurring fatigue, exhaustion, and gastric hyperacidity, among the common phenomena noted are rapid heart, sweating, dilated pupils, indigestion, fine tremors, sweating hands, sometimes slightly cyanosed nails—a syndrome which is easily confused with mild hyperthyroidism, con ecaled tuberculosis and other chronic infections. This sequel to excessive nervous strain and excitation is often seen, and in many cases there is increased sensitization to adrenalm. This adrenal nervous syndrome occasionally constitutes the residue of hyperthyroidism even after operation.

From these premises, we might reason that in the case of a disease which is characterized by an excessive activity of body-wide extent, lessening of adrenal activity would be expected to lessen the abnormal activity of the cells of the organism, and thus to improve the condition to which the excessive activity is due.

Some years ago, in the hope of thus controlling such conditions of excessive uncontrolled activity, or kinetic drive, I performed a series of partial adrenalectomies, with the following results

Eleven cases of epilepsy were operated upon Unilateral adrenalectomy alone was done in one case, unilateral adrenalectomy with partial thyroidectomy and division of the cervical sympathetics was done in seven cases, unilateral adrenalectomy with hyation of the thyroid arteries in one case unilateral adrenalectomy with ligation of the thyroid arteries and section of the cervical sympathetics in two cases. In two cases the operation was followed by improvement which has persisted for ten years, in another case the condition was improved for eight years, when the parameters of the par

tient died, and there was slight improvement in four cases followed by the return of the disease.

During the past few years, German surgeons have shown a marked interest in adrenalectomy in the treatment of epilepsy, this interest having been initiated by Fischer and Brüning. The basis for Fischer's belief in the efficacy of the operation was that excessive response of the muscle fibers to stimulation which is manifested in convulsions is due to a peripheral as well as to a central mechanism, and since in Addison's disease, for example, muscular asthenia is the outstanding symptom, he believes that the muscular activity is governed in the main by the adrenals. It is stated by Brüning that Fischer's experimental studies to establish the point that the chromaphil substance is mainly responsible for muscular activity were undertaken in 1913 and 1914 but have not been published. In those researches he demonstrated that the cortex is the part of the adrenal concerned in muscular activity.

Brüning tested this conception in 14 cases of severe epilepsy and reported no mortalitics, three cases under treatment, five cured, less intensive and less prolonged but more frequent attacks in one case, and no beneficial results in five cases of long standing. Brüning's results, however, have not been confirmed by other reporters. Specht in particular repudiates the work of Fischer and Brüning, and on the basis of an experimental study states that in part at least the failure of the operation is due to the fact that according to his experiments there is an early hypertrophy of the remaining adrenal, and of the remainder of an adrenal after partial resection.

On the basis of these collected experiences, the value of the operation for epilepsy, therefore, would seem still to be *sub judice*.

In three cases of cardiovascular disease, unilateral adrenalectomy alone was performed in one, as the result of which the symptoms were slightly relieved for nine years. In the other two cases, unilateral adrenalectomy with partial thyroidectomy was done in one, and in the other unilateral adrenalectomy with partial thyroidectomy and resection of the cervical sympathetics. These last two patients were unimproved, both dying of apoplexy, one five months and one a year after operation. Three years ago I performed a unilateral adrenalectomy and partial thyroidectomy in another case of hypertension with the result that the blood pressure has fallen progressively from 210/110 to 160/92 and the patient feels and appears well.

In three cases of Raynaud's disease, no improvement followed unilateral adrenalectomy.

In two of these cases section of the cervical sympathetics was done also.

Four operations for apparently hopeless cases of neurasthenia were performed. In one, unilateral adrenalectomy alone was followed by no improvement. In one, unilateral adrenalectomy with partial thyroidectomy was followed by immediate improvement, but there has been no further record of this patient after her discharge from the hospital. In two cases, the operative procedure comprised unilateral adrenalectomy with partial thyroidectomy and division of the cervical sympathetics. One of these two patients was unimproved but the other recovered completely, and during the eight years since operation has shown no return of the symptoms.

My experience in this group of cases has included 22 unilateral adrenalectomies for the conditions cited above, with doubtful results in cases of epilepsy, neurasthenia and cariovascular disease, and negative results in Raynaud's disease.

It occurred to me later that there are two other kinetic diseases the character of which indicates that they are due, in part, to hyperfunction of the adrenal glands, and should therefore be controlled, in part at least, by the removal of one adrenal or by the division of the nerve supply to both adrenals. I refer to hyperthyroidism and peptic ulcer.

The symptoms of hyperthyroidism and adrenalism are the same. That is, both adrenalism and hyperthyroidism cause increased heart action and increased pulse pressure, dilatation of the vessels of the skin, sweating, dilation of the pupils, increased metabolism, hyperglycemia, gastrointestinal disturbances and nerve activation. Clinically, it has long been known that the injection of adrenalin in a patient with hyperthyroidism produces a temporary exacerbation of the symptoms of the disease. Moreover, our experimental studies indicate that this correlation of clinical phenomena is due to an antithesis of function. The thyroid gland acts as a building up or charging mechanism, the adrenals as a discharge mechanism. Moreover, the chief-perhaps the only cause—of thyroid crises are those conditions which cause an increased output of adrenalin, namely, pain, emotional excitation, focal infection, infectious diseases, asphyxia, inhalation anesthesia, and hemorrhage. These, and the injection of adrenalin, are as I beheve the only conditions which can precipitate a thyroid crisis.

If, as the above facts indicate, hyperthyroidism depends in part upon the interrelation between the thyroid, the nervous system and the adrenal glands, then we may assume that hyperthyroidism can be controlled in a measure by a lessening of adrenal activity. On the basis of this assumption, we have removed one adrenal gland in 17 cases of residual hyperthyroidism following partial thyroidectomy, and have denervated the adrenals in one case. In each case, the symptoms were controlled. It should be born in mind, as stated by Specht, whom we have already cited, that early hypertrophy of the remaining adrenal will occur, so that thyroidectomy should follow the unilateral adrenalectomy as soon as the condition of the patient permits the operation.

The fact that peptic ulcer and hyperthyroidism occur in the same type of individual, and that peptic ulcer occurs under conditions similar to those which produce hyperthyroidism, has led us to make a study of the relation of the thyroid and the adrenal glands to the production of peptic ulcer. That increased gastric acidity is present in hyperthyroidism is well known, as is also the fact that in myxedema there is low acidity or anacidity. Moreover, in hyperthyroidism the incidence of peptic ulcer is increased; in hypothyroidism, peptic ulcer has not been reported. It would appear then that the activity of the thyroid gland controls gastric acidity. As we have stated, thyroid activity is controlled by the adrenal glands. That is, the thyroid gland must be stimulated by the sympathetic nervous system, and the most powerful control of the sympathetic nervous system is in the adrenal glands. If the adrenal factor can be controlled, then thyroid activity will be decreased and gastric acidity will be lessened. The activity of the adrenal glands can be controlled by the division of the nerve supply of the adrenals on both sides or by the removal of one adrenal gland.

In the experimental studies of G. H. Crile and Dr. Maria Jelkes this premise is well supported. In artificially induced myxedema the gastric secretion was markedly diminished and the total and free acid approached zero. While the removal of one adrenal did not produce as definite results as those obtained in induced myxedema, it was found that it did measurably influence the gastric acidity. Certainly, the removal of an adrenal measurably controls all the factors, psychic and physical, which influence gastric acidity.

The rationale of this procedure is still being investigated. We have already performed a unilateral adrenalectomy and a partial thyroidectomy in four cases of intractable peptic ulcer, and have divided the adrenal nerves in two cases. To date, the results have been favorable. At the present stage of our investigation, we recommend the trial of this procedure only in cases of recurrent ulcer in which medical and surgical treatment have been ineffectual.

#### SUMMARY

Indications for unilateral adrenalectomy or better bilateral denervation of the adrenal glands can not be finally stated at the present time.

In certain cases of residual hyperthyroidism, the symptoms seem to be completely controlled by division of the nerve supply of the adrenals or by unilateral adrenalectomy.

In cases of intractable peptic ulcer, denervation of the adrenal glands gives promise of good re-

Whether or not these operations will have a wide application is still sub judice.

#### THE NATURE OF ICTERUS NEONATORUM\*

By ALTON GOLDBLOOM, M.D., AND RUDOLF GOTTLIEB, M.D., MONTREAL, CANADA

From the Department of Medicine, McGill University Clinic, Royal Victoria Hospital, Montreal, Que

THE reasons for the occurrence of jaundice in new-born infants has puzzled investigators for many years. A vast amount of literature on jaundice in general, and especially on icterus neonatorum, has accumulated, without yielding a logical explanation of this interesting phenomenon which is visible in most infants, but which is demonstrated in all infants shortly after birth.

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 4, 1930.

The theories which have been advanced so far, in attempts to explain icterus neonatorum, may be divided into three main groups:

(1) It is only natural that some of these theories should consider the function of the liver as the prime factor in the production of jaundice, either through alterations in the bile flow, or through some derangement of the hepatic cells. For instance, Knoepfelmacher¹ ascribed it to stasis resulting from an increase in the viscosity of the bile, a fact which has never been demonstrated.

strated experimentally. Birch-Hirschfeld² and Abrami³ and others, attempted to explain the condition either through the existence of inflammatory processes, usually in the liver cells, or through the occurrence of oedema in glissons capsule, as observed by Birch-Hirschfeld in some instances. The failure of these observers to clearly differentiate icterus neonatorum simplex from other, notably infectious forms, probably accounts for the erroneous theories advanced. Infants with physiologic icterus do not die, and, therefore, a search for the cause of the condition cannot be made at the necropsy table.

- (2) Other observers like Violet and Hoffmeier<sup>5</sup> while suggesting the possible relationship of haemolysis to icterus neonatorum, still ascribed a hepatic cause to it, reasoning that the blood destruction, which was known to occur in new-born infants, resulted in an increase of viscid bile from the liver. These older theories could not include an icterus which could arise independently of the liver function, chiefly on account of the work of Minkowski and Naunyn,6 whose experiments on liver extirpation in geese showed that in birds with extirpated livers no jaundice could occur. We now understand, especially since the work of van den Bergh<sup>7</sup> that icterus can arise from haetmolysis alone, as well as from hepatic causes, and it is in the light of this knowledge that the understanding of our present theories on icterus neonatorum becomes possible.
- (3) The idea that icterus neonatorum arises merely through the destruction of an excess of red blood cells shortly after birth, is hardly a new one. It was first suggested by Virchow,8 and later abandoned by him. Heuoch, too, in his lectures, mentioned haemolysis as a possible explanation for the occurrence of icterus. Yet, in spite of an apparently direct route to the solution of the icterus problem through haemolysis, many observers have swerved in the direction of alteration in blood viscosity to explain the blood changes in the first days of life, and have been more inclined, like Heinemann<sup>9</sup> to consider the icterus as resulting from an incomplete functioning of the liver cells. It is quite true that water loss in the first few hours after birth results in an increased corpuscular volume, an increased viscosity, and thus, in a measure, to an apparent increase in the red cell count, but that there is an actual increase is, in our opinion, beyond question. Blood from the umbilical cord shows the same high red cell count as the peripheral blood of the infant. According to some authors, like E. Schiff,10 there is actually an increase in the red cell count over and above the original polycythaemia, and this increase, they hold, is due to viscosity changes. That there is polycythaemia at birth, that there is considerable blood destruction shortly after birth, and that there is

jaundice in the first few days after birth, are facts that are quite beyond all question. It is only necessary to show that these three phenomena are closely related, to prove the nature of icterus neonatorum. Eugen Stransky, in his book with Baar on clinical haematology in child-hood, has well expressed it by saying "... the origin of jaundice must depend on the considerable destruction of red blood cells, the reason for which is not clear. Even though the last word has not yet been said on the cause of icterus neonatorum, still it must stand in a casual re lationship to the disintegration of the red cells."

In our earliest observations on this subject we demonstrated the instability of blood taken from the umbilical cord. Most samples, however carefully obtained, showed a haemolytic tinge in the serum immediately upon centrifugalization. samples showed an increase in bilirubin content, as measured by the van den Bergh, and by the icteric index tests. Samples of cord blood which did not show haemolysis at first, developed a considerable amount on standing a few hours on ice. That this haemolysis was a function of the corpuscles themselves, and not due to a haemolysis in the serum, was demonstrated first by washing the corpuscles free of serum, and demonstrating the same amount of blood destruction whether the corpuscles were exposed to serum or to normal saline, and secondly by exposing normal adult washed red cells to blood serum from the infant, and demonstrating that the infant's serum exercised no haemolytic effect on normal corpuscles. We showed, too, that if infants' corpuscles were allowed to stand for from 72 to 90 hours the red cell count fell eventually to zero, and independently of whether the corpuscles were exposed to their own serum or to saline. Controls of adult blood were quite stable.

These first studies led us to make further observations on the question of the resistance of the red blood cells of the new-born infant to varying dilutions of salt solution. We found that the red cells of the new-born infant had not the power of withstanding saline dilutions to the same extent as normal adult blood. Some destruction of red cells took place even in physiologic saline, while adult blood shows normally no haemolysis in dilutions below 0.4% of salt solution. The interesting point, however, in the blood of new-born infants is that while haemolysis usually begins in physiologic salt solution, all the cells are not destroyed by the next higher solutions, but that some cells remained in all the dilutions, so that the point of complete haemolysis was quite near to the point at which normal blood haemolysed completely, namely, 0.4 to 0.35%. This led us to believe that all the red cells in the infants' blood did not possess the same degree of resistance to salt solutions, but that there must exist in the circulation cells of various degrees of maturity which differed con

siderably in their fragility

We know that the blood of the new born intrint contains a large number of nucleated red blood cells, and of reticulocytes. We felt, there fore, that it was important to attempt to ascertain whether these immature forms were less hardy than the more mature forms. This was done by exposing red cells to varying dilutions of saline until hacmolysis took place, then by studying the cells which remained unhaemolysed. We thus found that it was the immature forms which were more fragile, and we were able, by fractional haemolysing, to obtain a residuum which possessed the same resistance to saline as normal adult blood.

Again, we were interested in the changes in the resistance of red blood cells studied daily from birth to the end of the first week of life Here we found that the resistance which was diminished at birth gradually became normal by the end of the first week of life Now this change of the resistance to normal coincides with (1) the reduction in the total red cell count from 6 or 7 millions to 4, 5 or 6 millions per cubic (2) The disappearance or reduction millimeter in the number of immature forms, and (3) the development of icterus. In this way, we feel we have established our first premise, namely, that icterus neonatorum is hacmolytic in origin

A word might be said on the inconsistency of the findings of other observers in the question of frigility of the red cells in new borns. No uniform findings seem to have been reported Some authors claim normal fragility, and others increased fragility of infants' ied cells to hypotonic salt solution These differences in findings depend, we think on the time when the blood was examined Blood examined on the day of birth, or the day after, will invariably show an increase in the fragility. So too will umbilical Blood examined when icterus has cord blood developed, that is after the fragile cells have been destroyed, will naturally show a normal re-Those observers, who, in studying icterus neonatorum, made their investigations only on infants with well marked icterus, could not expect to find an abnormal resistance of the red cells to salt solutions The study of icterus neonntorum must be begun at the accouchment, as it was in every one of our studies, and pursued to the end of the first week of life at least 11

The close relationship of polycythaemia, with the presence of immature forms, and hacmolysis with disappearance of normoblasts, and reduction of reticulocytes and subsequently the appearance of icterus, with an indirect van den Bergh reaction, all naturally suggest a pienatal unsaturation of oxygen in the foctus with a change to normal oxygen saturation immediately after birth. We know that all conditions of chronic

oxygen want produce polycythaemia, and show a reduced oxygen saturation of the arterial blood In congenital cardiac disease with cyanosis, there is always polycythaemia and oxygen unsaturation with increased oxygen capacity In mountain dwellers, there develops an increase in the number of red cells, and an increase in the immature forms, which return to normal when resi dence at lower altitudes is resumed some evidence to show that the underlying condition in polycythaemia vera is a chronic oxygen want in the tissues 1. Have we any evidence to suggest a similar condition of oxygen want in the foetus? We have first the foetal circulation, which, for the most part, consists of mixed arterial and venous blood. Such admixture must have the same effect on the tissues as it has in congenital cardiac disease The mixture of aerated and unrerated blood is in itself a suffi cient cause for the production of an increase in the number of red blood cells There is another factor The experiments of Hugget13 in which he found a lower saturation of oxygen in foetal goat's blood, as compared with the maternal blood suggested the possibility of a similar condition in the human foetus We studied the oxygen capacity and saturation of arterial maternal blood, and of foetal arterial blood from the umbilical vein 14 We were able to demon strate definitely diminished saturation of oxygen, and an increase in the oxygen capacity, which would be expected on account of the increased number of red cells in the foetal circulation This diminution in oxygen saturation was demonstrated in blood from the umbilical vein. This is the blood which carries the greatest concentration of oxigen in the foetal circulation, taken immediately after leaving the foetal respiratory organ the placenta, and this blood was found to he deficient in oxygen content. So then we have two factors contributing to a reduced supply of oxygen to the tissues, first the inefficiency of the placenta as a respiratory organ, and secondly, the admixture in the foctal circulation of arterial and venous blood.

The effect of such a combination of conditions is a stimulation to hacmopoiesis, and this explains the polycythaemia in the new-born infant, which must be accepted as real, and not only apparent

How are all these findings related to joundice in the new born infant? The joundice must be considered as the result of the changes which take place in the foctus with the initiation of pul monary respiration, for now the necessity for extra measures for the maintenance of oxygenation no longer exists, stimulation of bone marrow for extra haemopoesis ceases with normal oxygen supply, and the subsequent destruction of the excess of red cells particularly the imma ture forms leads to the liberation of haemoglo bin which, in turn, becomes converted into bili

rubin. This, we think, is the mechanism and nature of icterus neonatorum.

From all these findings, we felt that it should be possible to initiate these conditions of oxygen unsaturation in animals, to produce polycythaemia, and, by increasing the oxygen supply, to subsequently produce jaundice. It has, of course, many times been shown that polycythaemia will develop after prolonged oxygen unsaturation, and that the blood count will return to normal when the oxygen supply becomes normal. It has not been demonstrated, however, that this return to normal is accompanied by an increase in the bilirubin content of the serum, in other words, jaundice. The sole purpose of our experiments in this phase of our work was to see if such an icterus could be demonstrated.15 We have shown that guinea pigs, after ten or fifteen days in a chamber with half an atmosphere of pressure, develop a maximal increase in red blood cells, and haemoglobin which is about 30% above the normal average. Sections of bone marrow have demonstrated the enormous hyperplasia of the marrow in the experimental animal, as compared with the normal controls, and blood examinations have revealed an increase in reticulocytes but not an increase in normoblasts. Within a few hours after the return of the animals to normal atmospheric pressure, a falling of the red cell counts was noted. These fell to normal in about 5 days, and coincidentally with this fall, the icteric indices rose, and the indirect van den Berghs became positive, and did not return to normal until about 5 days after the red cell counts had returned to their pre-experimental levels. We thus demonstrated our point that, in animals with experimental polycythaemia, resulting from prolonged anoxaemia, jaundice can be produced when the cause which produces the polycythaemia is removed.

## Summary

We have been able to demonstrate that icterus neonatorum, which is present in all new-born infants, whether visible or not, is haemolytic in origin. We have shown that this icterus is related to the destruction of a large excess of red blood cells in the infants' circulation; and that the fragility of the red cells shows an increase in the first day or two of life, and a return to the adult normal at the end of the first week of life. The inefficiency of the placenta as a respiratory organ, coupled with the arterial-venous mixture in the fetal circulation, are regarded as at least two of the known factors which contribute to the development of the prenatal polycythaemia.

Finally, we have shown that, after having produced polycythaemia in animals by reducing their oxygen supply, jaundice can be produced when the oxygen supply is returned to normal.

#### Conclusions

These findings, we feel, explain the nature of icterus neonatorum. The prenatal anoxaemia acts as a stimulus to haemopoeisis. This extra stimulus ceases with the birth of the child, and the initiation of pulmonary respiration, except in infants with congenital cardiac malformations, where the polycythaemia persists. The removal of extra stimuli to blood formation results in the destruction of the excess of cells, particularly those that are less mature. The liberated haemoglobin produces bilirubinaemia, and hence jaundice. In this way we may consider icterus neonatorum, not as a disease, but as the result of a physiologic post-natal circulatory readjustment.

# FURTHER OBSERVATIONS ON THE TREATMENT OF ACUTE SYPHILIS WITH BISMUTH ARSPHENAMINE SULPHONATE (BISMARSEN)\*

By PAUL A. O'LEARY, M.D., AND LOUIS A. BRUNSTING, M.D., ROCHESTER, MINN
From the Section on Detratology and Syphilology, The Mayo Clinic, Rochester, Minnesota.

TOKES and Chambers reported their experience with bismuth arsphenamine sulphonate (bismarsen) in 1927. In 1928 one of us (O'Leary) reported observations from an experience of eighteen months with this drug in the treatment of patients with acute syphilis. Sufficient encouragement was afforded by the results of this preliminary observation of a limited number of patients to warrant further study, the results of which form the basis of this communication.

The drug was synthesized by Raiziss, and is essentially a combination of sulpharsphenamine and bismuth for intramuscular use only. The experimental evidence showed that the drug had a high spirocheticidal effect and a low degree of toxicity on laboratory animals. It was also shown that a drug which could be given by the intramuscular route would obviate some of the difficulty of administration encountered in the use of preparations made for intravenous use. Likewise it appeared possible that the use of this drug would do away with the use of any other form of medication and would thus decrease the economic problem of the treatment of syphilis.

In the first report, no effort was made to evaluate the remedy in terms of cure; complications, the effect of the drug on the acute lesions of syphilis, control of infectiousness, and details of the technic of administration were considered. However, the serologic data concerning both the blood and spinal fluid were noted. Deductions were not made therefrom, but particular emphasis was placed on the fact that in estimating the value of any remedy recommended for the treatment of syphilis, the most important factor, next to thorough clinical study of well controlled cases, is time. Periods of observation should extend for a decade before conclusive deductions are made as to the value of any method of treatment for syphilis. Accordingly, it is our purpose, in this second report, to record some of the results of our four years' experience with the

Four types of patients with syphilis have been treated: (1) those with acute manifestations of the disease, (2) those with cardiovascular syphilis, (3) a few children with congenital syphilis, and (4) a small group whose blood was persistently positive to the Wassermann reaction. In all, 310 patients have received a total of approximately 5,000 injections. This report includes only the observations on the patients with acute syphilis.

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., June 4, 1930.

#### TECHNIC OF TREATMENT

In the cases of acute syphilis, at least four courses of treatment were carried out, each course consisting of from eight to ten injections. The injections, of 0.2 gm. of the drug, were given every fourth day, and a rest interval of four weeks was allowed between each course. More recently the rest interval has been decreased to two weeks. In a few of the cases, early in the series, inunctions of mercury were used in alternation with the courses of bismarsen. Although four courses constituted the average series, there were several patients who received six courses or sixty injections of the drug.

#### RESULTS

Early Stages of Acute Syphilis. There were 167 patients who presented evidences of early syphilis, and who were started on treatment. The disease of these patients varied from the stage in which chancre was present and the Wassermann reaction of the blood was negative to the recurrent types, with lesions of the mucous membrane or skin. Of the 167 patients with acute syphilis, sixty-four (38.8 per cent) completed a minimum of four courses of treatment, the equivalent of at least thirty injections, in all 6.0 gm. of bismarsen. Thirty patients of this group not only completed the minimal four courses of treatment, but have reported for subsequent observation at intervals ranging from twelve to thirty months after the last treatment. Of this group of thirty patients, twenty-one are free from clinical or serologic evidences of relapse, whereas nine experienced relapse, in one form or another. Those who have done best are the patients who presented themselves for treatment while they were in the stage in which chancre was present and the Wassermann reaction of the blood was negative. Of six such patients, exfoliative dermatitis developed in one instance as a result of a different type of treatment elsewhere, but the serologic reaction has remained negative without subsequent treatment. The other five patients are clinically free from " disease after periods of observation ranging from twelve to thirty months.

Later Stages of Acute Syphilis: Patients in later stages of acute syphilis have not responded so favorably to treatment as our earlier experiences indicated that they would. Of four-teen patients with chancre whose blood reacted positively to the Wassermann test, seven have gone twelve to thirty months without recurrence; two allowed treatment to lapse and secondary

manifestations redeveloped; one patient suffered a relapse of the positive Wassermann reaction of the blood while receiving the fourth course of treatment, after an apparently favorable response earlier in the course of treatment. In four of the group, evidence of neurorecurrence developed several months after the required amount of treatment was completed.

In certain cases the response to treatment has been unusually good. The following case is an example.

Case 1: A single woman, aged twenty-six years, presented herself at The Mayo Clinic August 26, 1926, with a typical hunterian chancre of the left labium majus of three to four weeks' duration. Spirochaeta pallida were readily demonstrated by dark-field illumination. The Wassermann reaction of the blood was strongly positive by the Kolmer modification. The program of treatment, serologic and clinical response, and the results at the end of a period of observation of three years are tabulated in table 1.

TABLE 1 SUMMARY OF PROGRESS IN CASE 1

Date	Blood Wassermann Reaction (Kolmer)	Treatment and Comment
8-26-26 9-20-26	44 32	1.6 gm. bismarsen; 8 injections
10-18-26 11- 8-26 1- 5-27 1-18-27 3- 1-27 to 9-23-29	Negative Negative Negative	28 days' rest  1.6 gm. bismarsen; 8 injections 21 days' rest Cerebrospinal fluid was normal 1.6 gm. bismarsen; 8 injections 40 days' rest Wassermann reaction of blood (Kolmer) negative March 1, April 1, June 15, and September 13, 1927; and March 29, September 8 and 23, 1929

In other patients a favorable response early in the course of treatment has been followed by relapse in the Wassermann reaction of the blood and relapse in the spinal fluid. The following case illustrates the beginning of neurorecurrence following treatment with bismarsen and the subsequent development of cutaneous and systemic symptoms of relapsing syphilis occurring one week after the completion of a full course of treatment by malarial inoculation of malarial parasites.

Case 2: A single man, aged twenty-seven years, presented himself at The Mayo Clinic October 6, 1928, with two penile chancres in an involuting phase, of possibly five weeks' duration. Darkfield examination disclosed numerous Spirochaeta pallida and the Wassermann reaction of the blood

was positive by the Kolmer technic. Treatment with bismarsen was carried out regularly over a period of nine months, during which time four courses were given of ten injections each. The clinical and serologic response was satisfactory up to four months after the last treatment. At this time, the Wassermann reaction of the blood reversed to positive and neurorecurrence and cutaneous recurrences followed each other in the succeeding four months. The lesions of the skin and mucous membrane developed one week following malarial treatment, which was administered for the neurorelapse. Subsequent treatment by old arsphenamine and mercury has been attended by satisfactory clinical response, but the Wassermann reaction of the blood remains The summary of serologic strongly positive. phenomena and of treatment is included in table II (case 2).

Neurorecurrence and Other Evidence of Relapse: In nine cases of primary or secondary syphilis in which the blood was serologically positive but spinal fluid was negative at the time treatment was started, signs of invasion of the central nervous system developed either in the course of the period of treatment or after several months of observation. In two cases of this group the patients were slightly delinquent as regards the program of treatment. Severe meningeal neurosyphilis developed in the fourth course of treatment in one case; lymphocytes in the spinal fluid numbered 3,196 for each cubic millimeter (table 8).

In the estimation of the condition of the spinal fluid, a cell count of six or seven lymphocytes for each cubic millimeter was taken as the upper limit of normal. As has been frequently observed, pleocytosis was the first indication of the development of asymptomatic neurosyphilis. This was preceded in all cases by relapse of the Wassermann reaction of the blood to positive. Several instances of neurorecurrence have been detected earlier because of the practice of following every instance of relapse of the Wassermann reaction of the blood with reëxamination of the spinal fluid, a negative report on previous occasions notwithstanding.

There were nine patients who were thoroughly treated, who nevertheless showed evidence of asymptomatic neurosyphilis at the time the first examination of spinal fluid was made, shortly after treatment was started. These, on the whole, responded so poorly to treatment with bismarsen that it was necessary to adopt more intensive treatment.

Relapse of the Wassermann reaction of the blood occurred in six cases in which the spinal fluid was not abnormal. In four of these cases, the relapse occurred in the third or fourth course of treatment; in one case it was delayed several months, whereas in the sixth it was de-

layed for one year after treatment. There were no attendant evidences of cutaneous recurrence in these patients at the time of the relapse in the Wassermann reaction of the blood

A woman, aged twenty-six years, presented herself with a papulosquamous syphilide. Treatment was begun July 25, 1927, and was carried through the first course of eight injections, and the cutaneous lesions disappeared. Three weeks later, the papular lesions reappeared in spite of treatment. After continued treatment, however, these lesions disappeared.

In a case recorded in table 2 (case 2) inoculation of malaria was used as treatment for neurorelapse. Cutaneous papular, crusted lesions cropped out one week after the last malarial paroxysm. In three other cases there was evidence of recurrence in nucous membrane while the first or second courses of treatment were being given, but in each instance there had been a lapse from treatment, and for that rea-

son the drug cannot be held at fault.

Clinical Effects: There has been no change in the observations reported previously, namely, that the visible evidences of acute syphilis have been slower to disappear under treatment with bismarsen than under treatment with a number of other preparations of arsphenamine and that the spirillicidal effect likewise has been delayed. Accordingly, in the control of infectiousness, the drug is of limited value from the standpoint of public health.

Bismuth arsphenamine sulphonate has been given to patients past middle age, with few signs of intolerance. Several patients aged more than sixty years had acute syphilis and they have shown, as would be expected, a favorable response to treatment.

Five pregnant women have received treatment without complication. The series is too small and the interval of time too short to permit of any general deductions as to the efficacy of their treatment. One of the patients had latent syphilis and was treated in the second month of pregnancy; the others who gave evidence of secondary syphilis when first seen were treated in the last trimester of pregnancy. The child of one of these women proved to be definitely syphilitic at birth and died after two months, without treatment. The other four children have been examined repeatedly and are still free from infection after one to two years.

Complications of Treatment: Patients occasionally complained of pain at the site of injection in the buttock but usually the application of heat in the form of compresses on the site afforded relief. The addition of a local anesthetic (Butyn) materially decreased the discomfort of the injection. Severe pain and induration were rare. There was one instance, each of hematoma and of sterile abscess, legislatic

occurred in children. In the entire series of patients treated, it was found necessary to discontinue the use of the drug because of severe local reaction in five cases only.

Lighting up of the primary or secondary lesions, in the form of a Hersheimer reaction, occurred frequently, although the time of onset of such reactions was delayed from twenty-four to forty-eight hours after the administration of the initial dose of the drug. In certain of the patients with cardiovascular syphilis there was definite increase in anginal pain on the day following the first treatment.

Nitroid reactions of the acute type occurring shortly after the injection were not seen. In a small number of patients, six in all, delayed nitroid reactions came on from eight to twelve hours after treatment. They were manifested by chills, fever, dyspnea, nausea, vomiting and diarrhea. For two of these patients, it was necessary to substitute another preparations of arsphenamine and the second preparation was well tolerated.

Severe cutaneous reactions were limited to the one case of exfoliative dermatitis mentioned elsewhere. Three cases of urticaria developed shortly after the injection, and in eight other cases there was generalized pruritus, with diffuse erythema. In most of these cases, use of the drug was discontinued.

Purpuric manifestations, and dyscrasias of the blood, such as were fairly common under treatment with sulpharsphenamine, were encountered in one case. A woman, aged twenty-six years, had an alarming degree of anemia in the fourth course of treatment. The concentration of hemoglobin dropped to 33 per cent and occasional areas of ecchymosis appeared over the thighs. Shortly afterward examination of the spinal fluid gave evidence of neurorecurrence. Under the administration of old arsphenamine there has been steady improvement in all respects to date.

In only one case was there evidence of renal injury. This patient had considerable albuminaria in the fourth course of treatment. In three other cases there was mild, transient albuminuria.

Severe ulcerative stomatitis occurred in three cases and necessitated temporary discontinuance of treatment. In two other cases a milder type of gingivitis and stomatitis appeared but responded to local treatment. In these cases the general treatment was continued in reduced dosage. A bismuth line on the gums, tongue, and buccal mucosa was noted in many of the cases, particularly in the last course of the treatment.

#### SUMMARY

An experience of four years in the use of bismuth arsphenamine sulphonate (bismarsen) in

TABLE II
NEURORECURRENCES IN NINE CASES OF ACUTE SYPHILIS TREATED BY BISMARSEN

\*Seuropecurrence alm at invariably preceded by relapse in the Wassermann reaction of the blood

the treatment of syphilis, particularly of the acute phases of the discase, affords sufficient time to permit of certain deductions in regard to its therapeutic effect, notwithstanding the fact that a much longer period of observation of the treated patients is necessary before permanent conclusions can be drawn

A satisfactory proportion of the patients (388 per cent) completed the prescribed number of injections, with varying rest periods between the Severe reactions to treatment have been The drug has been well tolerated by the patients as a whole including particularly elderly persons and those with severe cardiovascular Moreover, for children and for those adults to whom intravenous treatment is a trial both to patient and physician, the intramuscular route of administration of a combination of sulpharsphenamine and bismuth is a procedure much to be desired

Of the 167 patients with acute syphilis who were started on treatment, sixty-four completed a series of at least thirty injections, but only thirty of these patients have been observed recently enough to warrant statistical study these thirty patients, twenty-one have not shown evidence of clinical or serologic relapse, whereas nine have manifested neurorelapse in the form Six patients of asymptomatic neurosyphilis with chancre whose treatment was started while the Wassermann reaction of the blood was still negative apparently are "cured" Of fourteen patients who presented seropositive primary syphilis when treatment was started, seven have withstood the test of observation and the condition of seven has relapsed in one form or another None of the nine patients who presented asymptomatic neurosyphilis when first seen with the signs of acute syphilis maintested improvement in the condition of the spinal fluid

It is thus evident that the incidence of iclapse, particularly in the nervous system following the use of bismuth arsphenamme sulphonate is high er than with other systems of treatment previously used by us for acute syphilis cases in which munctions of mercury were used coincidently, no material decrease in the incidence of relapse was noted In a smaller series of cases in which treatment has been administered more recently, decreasing of the interval of time between the courses to two weeks, and giving a minimal of forty injections, there has not been as yet, any obvious change in the results of treatment

The encouragement, drawn from the response in a limited number of cases, early in our experience with bismuth arsphenamine sulphonate, has not been substantiated by longer observation in a larger series of cases That the drug has limited value in syphilotherapy is evidenced by the results of treatment in the seronegative stage of chancre However, the frequency of neurorelapse has been sufficiently high to offset the results in this small group

Further observation of the thoroughly treated patients will be necessary in order finally to evaluate the drug in terms of chincal cure

## THE ANATOMIC BASIS OF PERSONALITY By IRVING J SANDS, M D, BROOKLYN, N Y

ERSONALITY may be defined as the aggregate of the physical and mental characteristics that enable the individual to respond in a characteristic fishion to definite situations, that distinguish him from others and give him

his own peculiar individuality. It is the resultant of the interaction of the intellectual capacity, the physical make up and the emotional and instinctive endowment of the person. Of late years much attention has been given to personality by those dealing with neuropsychiatric patients for an understanding of it embles the physician to

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester N Y June 4th 1930

evaluate the patient's capacity for adaptation to the demand of every day life and for meeting its vicissitudes. Moreover, our schools and universities as well as our great industrial and business institutions are absorbed with this subject in order to train the individual along those lines of endeavor that may assure a successful career. A discussion of this subject therefore seems opportune.

In its ultimate analysis it is quite apparent that the correlation of the various bodily activities cannot occur except through nerves and chemical substances such as the products of the glands of internal secretion. Therefore in considering the anatomic basis of the expression of personality it is necessary to discuss the cerebro-spinal nervous system, the vegetative nervous system, and the glands of internal secretion, for it is through these three systems that behavior ensues.

In the process of evolution there has occurred a shifting forward of the sensory and motor functions of the brain towards the higher centers, namely the diencephalon and especially the telencephalon.¹ This is called the process of telencephalization. The diencephalon is the most cephalic division of the brain stem and the first portion of the cerebrum. The thalamus and metathalamus form a relay station for sensation coming from all sensory pathways. Receiving so many sensory stimuli from various portions of the body, the thalamus has become a real synthetizing organ for all sensation necessary for the production of feeling tone so essential in affective life and emotions. Clinical evidence also points to the thalamus as the centre for affective tone. The neothalamus is a relay station in all the somatic sensory pathways, while the paleothalamus serves as a relay station for the olfactory and gustatory sensibilities. The proper coordination of the various impressions received in the thalamus and especially in the hypothalamic region constitutes a peculiar general sense of well being so characteristic of all healthy individuals. Disturbance in this sense of well being may result from disease or injury in the pathways leading towards the thalamus. The mammillary bodies serve as a relay station to the olfactory sense. The tubercinerium is a relay station to the gustatory tract. The hypophysis as expressed in the activities of the pituitary gland, acts as a part of the endocrine system of the body, exerting a decided influence upon somatic growth and sexual development and materially affecting metabolism. The feeling tone resulting from sexual excitement and general visceral activities apparently have a general center in the diencephalon.

The connection of the cerebral cortex with the thalamus by means of the peduncles permits further elaboration of the sensory stimuli reaching the thalamus in the realm of con-

Moreover this also enables the cerebral cortex to exert a more or less modifying and controlling influence upon the instinctive and emotional urges of the individual. Personality and behavior still retain the basic relationship to primitive emotions. The feeling tone arising from the diencephalon pervades all the higher psychic faculties, and colors them with feelings of pleasure or pain. The emotions of anger and fear as well as sexual emotion undoubtedly are registered in the diencephalon, and from there streams of sensation leading to the higher cerebral centers color all psychic activities. Disease and injury to these centers influence considerably affective reactions, and cause abnormal behavior which may generally be considered as psychoneurotic in their manifestations.

In the region of the third ventricle, centers have been located that are most important to the existence of the individual. Center for sleep,<sup>7</sup> center for control of water metabolism, and other metabolic processes have been described. Those are most important in their relation to the affective life of the individual.

The corpus striatum forms a considerable portion of the prosencephalon. It is connected with the interbrain and the midbrain, the thalamus and subthalamus. In the lower forms of life it represents the highest form of motor impulses. In man it is essentially concerned with automatic associated movements, as well as control over the tone of the striated muscles of the body through its connection with the red nucleus forming the striato-rubro-spinal path-However, clinical experience seems to point to the influence of the corpus striatum upon the emotional and affective life of the individual in addition to its influence on motor function. Epidemic encephalitis which produces pathological changes in the corpus striatum has produced a large number of individuals presenting the so-called Parkinsonian Syndrome. Attention has been repeatedly called to the similarity between certain types of catatonic schizophrenics and those suffering from the Parkinsonian state of chronic encephalitis. In both one finds not so much disorder of ideation and of perception but rather a disturbance of affective reaction. This disorder seems to be in volition rather than that of intelligence. Affective flattening is common to both. Likewise emotional outbreaks and impulsive behavior are found in each. Both groups seem to have a pathological suggestibility. While in epidemic encephalitis definite pathological changes are encountered in the corpus striatum, it is quite possible that in catatonic schizophrenics these regions may be involved by physiological or functional routes if not by actual structural changes, causing similar disturbances The corpus striatum and the diencephalon apparently comprise a region which may be regarded as the point of fusion between the organic and the functional activities

The endbrain represents approximately 70 per cent of the entire nervous system Its ex treme growth enables the individual to acquire new expression experience. Experience may be defined as the sum total of sensory expression received by sense organs and correlated in the brain. The primitive feelings of hunger, sex, anger, fear and hate elicit certain responses which are common to most human beings, and the response is more or less rigid and inflexible phylogenetically conditioned, and may be designated as genetic behavior The acquisition of the cercbral hemispheres with the resultant expansion and elaboration of stimuli received by them produces a multitude of experiences which produce different types of behavior in different individuals is occasioned by training, learning and specific No two individopportunities for reactions uals have had identical experiences perience of the physician, the lawyer, the scholar, the explorer, the soldier etc, are entirely different, and naturally produce types of personalities and behavior that are distinctly individualistic Such behavior might be designated as ontogenetic behavior The basal ganglia are intimately connected with genetic behavior The pallium of the hemisphere however, determines individual behavior cerebral hemispheres have made possible the growth of experience underlying this type of behavior The provision in the cerebral cortex for elaboration of each type of sensibility and the correlation of these various sensibilities by association pathways in the cortex have made this possible

Impulses of general somesthetic sensibility pass toward the brain over the sensory pathways after relay in the spinal cord, medulla and thalamus, terminating in the post central area, thereby reaching the field of consciousness Adjacent to this post central area is the somesthetic psychic area in which the various somesthetic sensibilities are given greater elaboration and further association in order to acquire the greatest possible benefit from these sensations The calcarine or visual sensory area is a primary cortical receiving station, adjoining this is the occipital or visual psychic area, where visual sensations are further elab orated and associated with other sensations The cortex covering the transverse gyri of Heschl is the primary auditory receiving These sensitions like in the other primary centers are but crude and unselected, and have to be elaborated and associated with other sensibilities in the intermediate temporal or auditory psychic areas. In this latter region the appreciation of various aspects of sound such as music, rhythm etc, are interpreted and correlated with other sensations and functions such as speech, etc. In the rhinence phalon are centers for the final registration of the sense of smell and taste which have a similar elaboration upon the adjoining cortex In the precentral area are located centers for the initiation of voluntary motor acts. All the areas of the brain outside of the frontal lobes are purely cognitive in their activities. By the combination of the various qualities of sensi bilities such as vision hearing, smell taste, and bodily sensation through the association pathways greater knowledge of the environ mental situation is afforded to the individual However, it is through the association with the frontal lobes that these sensations are syn thetized elaborated into greater experiences, and fully evaluated. The frontal lobes receive a rich contribution of nerve fibers from the optic thalamus which is the site of primary emotion and concerned in feeling tone frontal lobes are likewise connected with all other parts of the cortex by numerous associa-The frontal lobes therefore are able to synthetize all the stimuli reaching the cerebral cortex giving them a rich affective tone without which adequate cerebration would be impossible Reason, judgment, im agination and ideation in general are the result of frontal lobe activity These comprise intel-Personality comprises much of all past experiences registered in the various cortical centers and utilized for the adaptation of the individual to his environment through the activities of the frontal lobes

It is therefore quite apparent that upon the integrity of the cerebral cortex and its association and projection tracts depends the extent and degree of intelligence. Defect in the receptive mechanism of the cortex deprives the individual of a certain extent of registered experience and interferes with intelligence and personality. This is particularly apt to occur in disease and injury to the frontal lobes While there are many mental defectives caused by factors that are described as hereditary in character, there is unquestionably a large group produced by mal development, disease and injury to the cerebral cortex. During the last few years attention has been focussed upon the factors preventing normal cerebral de Thus intercranial hemorrhage in velopment the new born, encephalitis in infancy and childhood, and encephalitis complicating the various diseases specific to infancy and childhood, are now receiving due attention both by neuro psychiatrists and pediatricians as their deleterious effects and the consequent mental defect and behavior disorders are becoming more fully appreciated. We need but mention personality disturbances occurring in cortical degeneration or disease processes such as senile degeneration, arteriosclerosic disorders, paresis, frontal lobe tumors, etc., to impress the influence of cerebral disease upon changes in personality and behavior.

The vegetative nervous system<sup>2</sup> controls those very functions that are essential to life, the action of which is not brought into the sphere of consciousness. Such functions as cardiac activity, respiration, gastro-intestinal activities, reproduction, etc., are regulated by the vegetative nervous system. It is divided into the sympathetic and parasympathetic nervous systems. The sympathetic nervous system arises from the cells of the lateral horns of the thoracic and first three lumbar segments of the spinal cord, terminate in a chain of ganglia called the vertebral ganglia lying on each side of the vertebral column. From these ganglia non-myelinated fibers arise which innervate practically every organ in the body. The parasympathetic nervous system has a cranial and a sacral division. The cranial division arises from the midbrain and medulla and sends fibres along the third, seventh, ninth and tenth cranial nerves. The sacral division arises from the second and third sacral segments of the spinal cord and sends fibers to the bladder, rectum and external genitalia. The actions the sympathetic and parasympathetic nervous system seem to be antagonistic to each other. The sympathetic nervous system dilates the pupils of the eyes, increases heart action, inhibits the action of the smooth muscles of the gastro-intestinal tract as far down as the descending colon, and inhibits the action of the trachea, bronchi and of the gastric and pancreatic glands. It contracts the sphinctors of the gut and bladder. It contracts the muscles of the ureters and of the external reproductive organs. It contracts or dilates the vascular system depending upon the strength of the stimulus. The parasympathetic division contracts the pupils through the third nerve. stimulates the sublingual and submaxillary glands through the seventh nerve, stimulates the parotid gland through the ninth nerve, and through the tenth nerve it slows the heart; contracts the larynx and bronchial musculature, and stimulates activities of the gastrointestinal tract, lungs, liver, gall bladder and pancreas. Through the sacral division it relaxes the muscles of the sphinctors of the gut and bladder and stimulates the muscles of the bladder and the rectum. The action of the -sympathetic nervous system is best seen in time of intense emotion as in rage, anger and

combat. The parasympathetic nervous system however, seems to best function for the purpose of storing up energy for use in time of need. Furthermore, it regulates the functions of waste disposal and reproduction. Overactivity of the sympathetic division produces a condition called sympaticotonia, while similar overactivity of the parasympathetic system causes vagotonia.

In considering the symptoms manifested by many of our neurotic patients, it is quite apparent that many of them are expressed anatomically along the vegetative nervous Cardiac palpitation,5 respiratory difficulties, gastro-intestinal disturbances and symptoms referable to the bladder and intestines are frequently manifested by neurotics. Those are primarily due to stimulation of the vegetative nervous system. In acute toxaemias we meet symptoms that are essentially due to stimulation of the sympathetic nervous system. Thus we encounter flushed face, high temperature, the tachycardia, perspiration, and interference with the gastro-intestinal In anaphylactic reactions we encounter symptoms that may be best explained as stimulation of the parasympathetic nervous system. Many of the symptoms encountered in different parts of neurotic personalities, when analyzed, are referable to overactivity of one or the other divisions of the vegetative nervous system.

The glands of internal secretion<sup>3</sup> play a most important role in the development of personality. Amongst these glands, the most important are the thyroid, the pituitary, the adrenals and the gonads. Deficiency in the thyroid glands in their developmental period of life causes the condition of cretinism characterized by the small stature, the dry skins, subnormal temperature, slow pulse and in the low metabolic rate. Mental development is definitely retarded. Hypothyroidism later in life causes a syndrome referred to as myxoedema, and is characterized by lack of interest, mental retardation, irritability and apathy. The skin becomes thickened, nails brittle, pulse is slowed and respiration is diminished. There is a diminution in the metabolic rate. thyroid is extremely active in time of emotion In psychoneurotic individuals whenever the conflict is touched upon, there is a definite increase in basal metabolism.10 Even in the psychoses, elated, overactive and overtalkative states are accompanied by acceleration of the basal metabolic processes.11 Depressed states associated with motor retardation and inhibition of ideation are usually accompanied by lowering of the basal metabolic rate. The thyroid apparently plays a dynamic role in states of anxiety and mental

tension The adrenal glands through their secretion of adienalin stimulate the sympa thetic system and have a marked influence on Adrenalm itself relaxes the smooth muscle of the bronch; accelerates the heart beat and raises blood pressure. It increases metabolism and diminishes muscle fatigue It is an important factor in states of anxiety and danger. It tends to mobilize the sugar from the liver and from the muscles to be used in time of need and stress. It seems to help the individual to meet any distressing situation that arises suddenly, and plays a prominent role in mustering all the forces necessary in struggle The pituitary gland controls metabolism, promotes growth and controls the activities of the sex glands containing as it does the hormone that activates the gonads. Thus it plays a prominent role in The made the development of personality quate personality of the individual showing hypopituitarism is too well known to need further discussion. The sexual glands have a definite internal secretion that is responsible for the development of the secondary sexual These characteristics are in characteristics dispensable components of the personality of The influence of the thymus the individual gland upon growth especially in intra-uterine period of life and the influence of the para thyroid on calcium metabolism are mentioned as other elements in influencing personality

Instincts are innate tendencies towards action common to all members of any one species, which may not be eradicated from the individual, but which lend themselves to modification by training and experience. They are really definite reflex reactions which, in the course of evolution, have become grouped together in serial order in order to form reaction patterns to given situations, without any conscious recognition of the end to be obtained They have developed because they were of life and death value in the evolution of the race. In general, once the instinct is aroused its performance brings a pleasurable feeling and the failure of its performance brings an exceedingly prinful onc stricts therefore have an affective or feeling side as well as an active motor side affective elements are known as emotions. As pointed out earlier in this paper, the thalamus seems to be a definite center for emotions. It is upon the interaction of the instinctive and emotional responses plus the intelligence of the individual that normal personality depends

The instinctive and emotional responses are accompanied by definite physiological processes in the body. All emotions are accompanied by the secretion of adrenalin from the idrenal glands, which mobilizes sugar necessity.

sary to: the immediate requirements of all muscular and glandular activities The vege tative nervous system correlates the activities of the various organs, in order to obtain smooth and uniform results. Adrenalin in the circulation stimulates the sympathetic nervous system, relaxes the smooth muscles of the respiratory tract thereby causing increased oxidation, and releases glycogen from the liver to be used by the muscles and glands in the tormation of energy. The activity of the thy roid gland is enhanced tending to further stimulate oxidation. There is a shifting of the blood supply to the brain, and there is increased cardiac activity and respiration causing greater oxidation and facilitating removal of waste material With the release of energy accompanying gratification of the instinctive demand of a particular instinctive urge there is a general slowing of circulation, decrease in the rate of respiration, and there ensues a feel ing of relaxation and a sense of well being

Because of the change in the environment that modern civilization has occasioned, it is hardly feasible or even necessary for the rapid and immediate gratification of the various in stinctive demands, but, although the environ ment is changed, the physiological mechanisms of the emotions, developed throughout so many ages of evolution, function in their usual manner Therefore while we may inhibit the instinctive reactions because they involve the voluntary nervous system and the voluntary muscles which are under conscious control to a large extent, we cannot prevent the concommitant emotional reactions because they are under the control of the aggetative nervous Hence, such emotions as anger, fear, and sex, which are most ant to occur without then accompanying instinctive motor expression, are most likely to prove injurious to the personality of the individual since they tend to pour into the blood stream those very sub stances which are no longer utilized in the body and which tax the individual to the They therefore produce markedly ex hausting effects on the human constitution

Chronic wasting somatic diseases<sup>6</sup> likewise exhaust the endocines and vegatitive nervous system producing definite changes in the personality of the individual <sup>9</sup>

While the anatomic basis of personality is fairly intelligible to one who has studied the subject the geness of the inge-priticularly of the instinctive and the emotional drives of the individual is not quite so clear. One who his worked in clinical neurology and psychiatry, is left with a sense of futility in trying to explain behavior disorders and personality changes on the basis of neuropithology or neuropity softery tions. It is with a sense of

relief that one turns to psychoanalysis for the solution of that problem. As pointed out by Freud, love and hunger are the dominant forces that control human behavior and determine personality. In most instances civilization has put a barrier to the natural gratification of these emotional cravings. They may be expressed along other channels vicariously through sublimation. The direction in which these sublimations go is determined in a large measure by the type of personality reaction. When these sublimations pursue a course that is fairly satisfactory to the ego and in pursuance to laws and conventions established by society, normal behavior and a normal personality results. unsatisfactory to one's ego or in conflict with standards set by society, mental conflict ensues and a thwarted personality results. Perhaps the following case might clarify this point:

A school teacher, 30 years of age, was seen by me in 1924, complaining at that time of cardiac palpitation, restlessness, sense of discomfort about the epigastrium, and irritability. He was shy in the presence of women and he then displayed fear of closed spaces and fear of being left alone. After an interview he did not return. One year ago he returned with a history that his condition had become decidedly worse. He had seen many physicians who told him that he was nervous and that he was imagining his entire ailment. Several physicians told him that he was suffering from hyperthyroidism and a few told him that he was suffering from stomach trouble. interviewed at the last examination he complained of being afraid to go into the subway and of being left alone. He did not form any friendships with women as he felt very uneasy in their presence. He also suffered from cardiac palpitation, intense diarrhœa and marked epigastric distress. He produced a report of a basal metabolic test which showed a slightly increased rate.

It is quite apparent that this man's symptoms anatomically expressed themselves as a disorder of the vegetative nervous system. This, however, was occasioned by intense instinctive and emotional factors. To those who are trained in psychoanalytic technique it is quite apparent that this man was an unconscious homosexual with a neurosis as an expression of some conflict. Psychoanalytic therapy revealed to the patient his anal erotic personality, the underlying psychological mechanism in his disease due to a conflict caused by an intense castration complex. A therapeutic result was obtained by analysis where other forms of therapy formerly had

in infancy and childhood. Much of personality is formed by identification with parents and The sublimation of instinctive and emotional urges along satisfying and socially approved channels tend to create a normal Hence the importance of the personality. modern movement of child guidance and child training. For it is in infancy and childhood that most of personality is formed. prejudice, religious antagonism, and political and social bigotry are explained on underlying emotional and instinctive forces, and resist reason and logic. They are accompanied by tremendous physiological processes in the body, and are really phylogenetic in their behavior. Such behavior is particularly apt to be manifested in mob activities. It is only after unusual and intelligent training during childhood and infancy that even the most educated and cultured are able to control the emotional drives that are manifested in prejudice and hatred. Hence the importance of proper and intelligent child guidance and training.

## Conclusion

1. Personality is the aggregate of physical and mental characteristics that stamp the individual as a unit amongst his fellow beings.

2. Personality is the resultant of the interaction of physical constitution, native intelligence, and instinctive and emotional endowment.

- 3. Anatomically it is expressed through the cerebrospinal and vegetative nervous system, and the endocrines.
- 4. Psychoanalysis alone offers an explanation of the instinctive and emotional drives of complex human behavior.

organs which could be attributed to the fungi inoculated. No unusual changes were observed in any of the spleens. Cultures made from all of the spleens and livers remained sterile

#### TREATMENT

Since the cause of chronic splenomegaly remains unknown we have nothing new to add in regard to treatment. It is, of course, of importance to make a correct diagnosis by ruling out splenomegaly due to known causes such as malaria or kala azar, especially where these diseases Syphilis, obscure tuberculosis, are common. ordinary cirrhosis of the liver and other conditions are often accompanied by large spleens and occasionally render a diagnosis difficult.

In our own experience in northern China we have had the most difficulty in differentiating primary chronic splenomegaly from ordinary hepatic cirrhosis and from kala azar. Furthermore, in many cases it is not possible to determine clinically whether the spleen or the liver were first involved, particularly when dealing with individuals who are incapable of giving a reli-After a diagnosis of primary able history. chronic splenomegaly was reasonably certain we have conformed to the usual methods of treatment. Any complicating factors, such as diabetes or secondary infections, were treated. Then attempts were made to correct the anemia with diet or blood transfusions and to "build up" the patient before removing the spleen. Splenectomy is the procedure giving the greatest benefit and often results in remarkable recoveries and apparent cures.

In our own small group of 7 patients, one was treated for several weeks without avail as a case of kala azar before the correct diagnosis was made. In 2 others it was discovered at operation and by histological examination that we were dealing with hepatic cirrhosis with splenomegaly. Neither of these 2 cases were benefited by splenectomy. Of the remaining 5, 2 were markedly improved, 1 was slightly improved, 1 was not benefited at all, and the last one was not observed long enough to report upon. Since only a year has elapsed since these patients were treated it is too soon to claim a permanent cure in any of them. However, as mentioned previously, the improvement in some patients after removal of the spleen strongly suggests that the spleen is the chief site of origin of the condition.

#### Discussion

It seems apparent that the siderotic nodules are of much less importance in splenic disease than has been indicated in many recent publications. Since they have been found in a number of other diseases of the spleen and in other tissues of the body it does not seem justifiable to form a special grouping for spleens containing the nodules as McNee has done. It would seem that until further work is done groups I and IV may profitably be merged.

In regard to the relationship of the nodules to fungi in the condition called by some observers "splenic mycosis," much can be refuted. The recovery of at least 5 different varieties of fungi from spleens by various investigators speaks against the etiologic importance of any one fungus. Fungi were recovered from spleens devoid of nodules and from a number of spleens studded with nodules no fungi could be grown. We have shown that the filaments found in the nodules are not mycotic hyphae but merely degenerated tissue fibers impregnated with iron and calcium salts. Siderotic nodules have been experimentally produced in cats by the injection of alcohol into the spleen.8 Experimental inoculation of 2 varieties of fungi recovered from spleens failed to cause either splenomegaly or anemia in any of the 9 monkeys studied.

#### Conclusion

McNee's new classification, although helpful. is already in need of revision.

Cultural, pathological and experimental evidence indicate that certain suspected fungi have no etiologic relationship to chronic splenomegaly with anemia.

The treatment for primary chronic splenomegaly has been discussed.

# PRESIDENTIAL COMMENTS ON CURRENT EVENTS—No. 8 PUBLIC RELATIONS

All the activities of the State Society are increasing rapidly but not one so fast as medical public relations. There must be a reason for this. I believe that it is not different from that which is behind every successful project,-a need. Public relations simply meets a general professional need. Of course, the committee of men in charge of it, trained by experience in medical affairs, have carefully guided the new force in organized medicine. Beyond this, however, it is primarily assisting the medical profession to meet the new obligations imposed on it by present day social trends. It is helping by the principle of conference, the profession to coordinate the various health influences; and helping to reach conclusions regarding the soundness of activities of non-professional agencies. It is helping to build a health program in which all agencies may become cooperative and in which the medical profession may become leaders in medical matters.

"Public Relations" is not "Public Health." In many counties these two committees are combined and while there may be no objection to one committee carrying two functions, it is difficult to keep the two functions separate and distinct.

The effort to improve public medical relations is based on the apparent fact that whatever was found best for the public interest would prevail and would have behind it the force of public opinion. This would soon out-weigh all personal or selfish professional interests; and that in the end, the public would seek medical protection from disease independently of whether it came, voluntarily, from the medical profession or from the service of doctors subsidized by the State. It was believed that the best way to avoid the danger of state medicine and the danger of a greater evil-socialized medicine-was to establish a cooperative relationship with all health agencies on such a basis as would give the public the service that it needed, permit this service to grow in such a way as to keep pace with increasing needs and changing times, maintain the virility of the medical profession and avert State control of the practice of medicine and the evil of disturbed personal relation of patient and doctor.

The Public Relations Committee believes that the public expects the direction of public fiealth service by doctors. It believes that the public looks to the medical profession to make available the resources of all health agencies, either official or unofficial. It believes that the public expects the medical profession to coordinate all health influences and to cooperate with them.

The State Society is advocating policies that will enable the profession to take medical leader-

ship in any health program. It believes that the profession should do this for its own good and the cure of the ills of which it complains. Public medical relations have advanced farther than has been realized in several counties of the State. In these counties there is no lack of coordination of health influences and no cooperative failure. As a by-product of all this, private practice is increasing because of public interest and public request for preventive service.

Medicine is coming to occupy the place that the public expects it to occupy. The local profession in any community or any county—anywhere rural or urban—must undertake to lead its community in its health program and in its medical relationships. Public opinion will then support it, and the medical profession will then occupy the place that it deserves, and not be in danger of being subservient to the State.

Organized medicine through the Public Relations Committee is undertaking to constructively solve unsolved health and medical problems instead of destructively contending with the efforts of the public, assisted by unofficial agencies, to meet its problems and to base its objection to any program on the ground that it interferes with the private practice of medicine. The Public Relations Committee undertakes to have made an inventory of the health activities of each county and the relation of the profession to them. After that it undertakes to confer with the profession and these agencies so as to constructively bring to the governing bodies and the various public health agencies, organized medicine's suggestions and criticisms.

In closing this comment, I wish to say that while all committees of the State Society should be very carefully selected, in none of them is it more necessary than in the Public Relations Committee. The members of this committee must be thoughtful, persuasive, and diplomatic. It has really a very diplomatic mission to perform and it also has the important duty to impress organized medicine's point of view and to interpret to the members of the State Society, the aims of all public health agencies. The work of this committee is broadening the viewpoint of medicine. It is upholding the work of the general practitioner and making him more interested in the broader practice of medicine. It is doing more than any other activity of the State Society to develop conditions inimical to the on-coming drift of State medicine. If State medicine ever comes, it will be our own fault.

## DISTRICT BRANCH MEETINGS

Six of the eight District Branches of the Medial Society of the State of New York have held heir annual meetings and arrangements for mother are announced. The study of their programs is of value as an indicator of the trend of thought of the medical profession throughout the State. These programs were constructed by the officers of each District Branch and included those features which appeal to the local members. An analysis of these programs is contained in the accompanying table.

The President of the Medical Society of the State of New York was listed on the programs of three Branches; but he attended all of the six meetings which have already been held, and gave a half-hour address at each. It would seem that the President should have a conspicuous place on the program of every District, and should be given abundant opportunity to deliver an official message in the name of the State Society. Two branches listed other officers and chairmen of committees by name and two announced short addresses by officers generally. The President and other State officers were sometimes called upon to give their addresses during the luncheon period.

The officers of the branches gave official ad-

dresses in only one district. The Mayor welcomed the visitors in one district, and the Medical Superintendent of the local hospital, in another. No county society officer was listed on any program.

Public health was directly discussed in only one district, but tuberculosis was emphasized on two

programs.

Medical economics was discussed in five districts, four of which discussed the new welfare law, and one took the subject of workman's compensation.

The scientific part of the programs made by far the greatest appeal to the members, and those in attendance, talking among themselves. frequently said, "When will we hear the scientific discussions?" The interest of the members and their presence in the meeting halls were largely in proportion to the fame of readers of papers as speakers who were interesting and practical.

During the last few years, the Second District Branch, composed of Long Island, has not included scientific papers on its programs, but has confined its discussions to subjects directly connected with organized medicine and its relation to other organizations engaged in dispensing health service.

## LOOKING BACKWARD

## This Journal Twenty-five Years Ago

Medical Directories: This JOURNAL of October, 1905, refers to the Principles of Medical Ethics of the American Medical Association, and quotes the paragraph which refers to publicity and advertising as applied to the individual doctor. It then discusses the ethics of medical directories as follows:

"Some members of the profession are inclined to criticize a directory published by the County Medical Society, in which the names of all physicians belonging to the organization are in blackfaced type, while light-faced letters are used for those who have no such connection. The defenders of this plan maintain, however, that as the book is published by the society primarily for the information of its own members, no invidious distinction is intended. A similar directory published by the Medical Association in this county, however, does not typographically indicate the association members."

The Directory of the A.M.A. prints members of county and state societies in capitals, and the others in ordinary lower case type, thus establishing a necessary distinction.

# MEDICAL PROGRESS

The Surgical Problems Presented by the Diabetics.-A. T. Bazin states emphatically that diabetes, properly controlled by insulin and diet, offers no contraindication to surgery. During 1929, in the Montreal General Hospital, 73 operations were performed upon diabetic patients with 2 deaths, a mortality of 2.74 per cent, as compared with the total surgical mortality of 2.41 per cent. But surgery should not be undertaken in these patients without the collaboration of a biochemist. The blood sugar and not the glycosuria should be the guide in the case of the diabetic. There is a great similarity in the signs and symptoms of diabetic pseudo-acute abdomen and an acute abdominal lesion. With the latter there may or may not be fever. There are pain, vomiting, and leucocytosis, and the pain precedes the vomiting. In the diabetic pseudo-acute abdomen there may be fever, there is usually a high leucocytosis and pain and vomiting, but the comiting precedes the onset of pain. There is an indefinite diffuseness elicited upon abdominal examina-The general disturbance is altogether disproportionate to the abdominal findings. However, it is better to operate upon the abdomen of a diabetic and find nothing than to withhold operation from an acute abdominal lesion. There is retardation of healing with lowered resistance to infection in diabetics, and the author sees a surprisingly large number of patients whose faulty healing or low grade skin infection is dependent upon a disturbed carbohydrate metabolism. In these cases small doses of insulin appear to exert a favorable influence upon the indolent wound. Diabetic gangrene of the foot is of two definite varieties. In one type the etiological factor is infection. There is a normal arterial and capillary circulation. The treatment is that of diabetes and that of infection. One should wait for healing or for the line of demarcation, and amputation should be local and conservative. In the second type there is capillary blocking and the distal arteries will give no pulsation. If the foot is warm and well nourished amputation below the knee is indicated; if the foot is cold with marked change of color on posture and absence of pulsation in the popliteal artery, mid-thigh amputation will be required. Diabetes often follows acute pancreatitis, which is almost invariably associated with biliary tract infection. It is the author's custom, therefore, in cases of suspected biliary infection to study the pancreatic function, using the blood sugar time curve. If the patient shows diminished tolerance, common duct drainage is added to cholecystectomy. With this procedure there is a rapid, complete, and permanent fall of blood

cholesterol to normal level.—Canadian Medical Association Journal, August, 1930, xxiii, 2.

The Chances of Success of Artificial Pneumothorax in the Various Clinical Forms of Tuberculosis,-Dr. Charles Roubier says that when deciding to make an operative pneumothorax the first thing to be reckoned with is the possibility of failure through the presence of adhesions preventing collapse of the lung; such adhesions are present in about 16 per cent of the cases and there is in general no way of foreseeing them. Assuming that a pneumothorax of sufficient extent is technically realizable, even though the immediate result of the treatment is good in the majority, the remote results will be satisfactory in not more than 40 per cent. On the other hand, barely a third of the patients operated upon will be alive at the end of five years. A certain number of prognostic elements based upon the clinical appearance of the disease will help us to appreciate in advance the chances of success in the individual

I. In the ordinary fibrocaseous forms: (1) The chances of success are greater the earlier the operation is performed. (2) An antecedent serofibrinous pleurisy on the side of the pulmonary lesion is of bad augury on account of the almost certain presence of adhesions. (3) Doubt as to the absolute unilaterality of the disease is not a contraindication to operation. (4) The most important prognostic element is furnished by the evolutionary course of the disease. The subacute forms with rapid course offer a hope of only about 16 per cent of favorable results; in those in which the progress is comparatively slow, broken only by occasional acute exacerbations, we may look for 32 or 33 per cent of successes; the best hope of durable results is given by the chronic forms, whether ulcerative or not, success being reached in 70 per cent of the cases. (5) In a case where there is a cavity with indurated walls it may remain and continue to suppurate in spite of a pneumothorax. The location of the lesions also affects the results, both apical and basal forms being less favorable than those in hilar and juxta-hilar locations which are more easily compressible and usually free from adhesions.

II. Among the pneumonic forms we must distinguish between caseous pneumonia, in which there is no hope of success from operation, and tuberculosis of pneumonic origin in which the congestive or inflammatory element predominates, where much benefit may follow "collapsotherapy." However, in the case of acute or subacute tulær-culous pneumonia, there is not one chance in

three of success from the establishment of a pneumothorax. In the bronchopneumonic forms the chances are poor, though in certain rare cases brilliant results have been noted.

III. The forms marked by the occurrence of hemoptysis are in general much improved by the operation, if we except the cases of acute or galloping consumption marked by frequent hemorrhage; the congestive fibrocaseous forms without pleural complications are of peculiarly favorable operative prognosis.—Journal de Médecine de Lyon, August 5, 1930.

Carotin and Vitamin A.-L. K. Wolff, J. Overhoff, and M. van Eckelen have demonstrated that carotin, while curing the morbid symptoms arising from deficiency of vitamin A, is yet not identical with the latter. By means of the Carr and Price reaction for carotin and xanthophyll they succeeded in separating carotin from vitamin A, which goes into the alcohol phase with the xanthophyll. Then by means of quantitative determinations of the vitamin A and carotin content in various vegetable and animal products, they showed that vitamin A is scarcely if at all present in the vegetable kingdom-certainly not in demonstrable amounts—but that its source is carotin, which is transformed into vitamin A in the animal body. Hence the determination of the carotin in plants will give a picture of their vitamin A action. Products of mixed animal and vegetable content were examined and found to contain both carotin and vitamin A. To prove their findings beyond dispute the authors removed small bits of liver from rabbits and analyzed them; then they injected into the rabbit livers pure carotin dissolved in oil, and after three days again removed some bits and compared them with the first. They found that a large part of the carotin had been transformed into vitamin A. For example, a rabbit with no vitamin A before the experiment and no carotin was found three days after injection of 1.8 mg. carotin to have 1,000 units of vitamin A and only 0.8 mg. carotin. The protocols of four rabbits showed similar results. Experiments with overfeeding with carotin still further strengthened the evidence that the carotin of the plant is in part transformed into vitamin A in the animal organism, which possesses both in varying degree. Thus, liver and cod-liver oil contain almost solely vitamin A, while egg yolk and butter contain both.—Deutsche medizinische Wochenschrift, August 22, 1930.

Liver Preparations in the Treatment of Pernicious Anemia.—L. van Varga writes that a partial follow-up of patients with pernicious anemia who had been treated with liver preparations during their stay in hospital revealed that there had been recurrences in all those who had stopped the treatment or taken it only irregu-

larly, but that those who (largely to save expense) had substituted the use of cooked liver were feeling very well and had a nearly normal blood count. In some cases of recurrence the blood count was normal, but serious nervous symptoms had supervened. On the whole the author's experience with liver preparations cannot be called altogether favorable. Some of their value is undoubtedly lost in the manufacturing process, which necessarily subjects the liver substance to an injuriously high temperature. It is evident that raw or cooked liver exerts a better effect upon the cells of the bone marrow. When this was used in hospital cases, the results were as striking as in those patients who reported from their homes. In addition to immediate improvement, one case had been symptom free for seven months and another for twelve months, with normal blood count and hemoglo-Nearly all those not so treated had either relapsed or were already dead. In future it may be well, as now, to give liver preparations, preferably combined with insulin, for quick action in desperate cases, since it is difficult to administer 600-800 gm. liver daily to a person without appetite; but for further treatment in such cases recourse must be had to some substance which is apparently found only in raw or cooked liver. Although the results of liver treatment compare favorably with those of arsenic, we are still far, the author states, from having found the ideal treatment for pernicious anemia.—Münchener medizinische Wochenschrift, August 15, 1930.

Ligature of the Spermatic Ducts for Hypertrophy of the Prostate. - Dr. Paul Nichans claims to have had remarkable success in the symptomatic treatment of the hypertrophied prostate gland by means of what he calls the "Steinach ligature." By this term he means neither exsection nor section with ligature of the ductus deferens, but the bilateral occlusion of all the efferent vessels leading from the upper part of the testicle to the head of the epididymis by a silk ligature, care being taken to avoid inclusion of the blood vessels. The operation, done with care under local anesthesia, is painless and absolutely free from danger. In advanced cases with urinary retention the author keeps a catheter permanently in the urethra for five days, and at night only for a short time afterward. At the end of ten days the patient can leave the hospital, in most cases without any residual urine and permanently relieved of all his troublesome symptoms, as shown by subsequent examinations. Dr. Niehans states that he has performed over 100 operations of this nature during the past three years on patients with symptoms of prostatic hypertrophy ranging from the initial difficulties in passing water up to total retention, and with almost uniform success. The gland, he says, is not materially reduced in volume, but is softened and offers no obstruction to the free flow of urine — Schweizenische medizinische Wochenschrift, August 23, 1950

Sauerbruch-Herrmannsdorfer-Gerson The Diet.—Chalmers Watson, writing in the British Medical Journal, August 23 1930, ii 3633 describes the diet named in the title, which is in the forefront of medical interest and discussion in Germany at the present time. The claims of Sauerbruch and Herrmannsdorfer are concerned mainly with the value of this diet in surgical tuberculosis, that is, in cases of lupus and tuberculosis of the skin and bones as well as of the The essentials in the diet system are as follows (1) The all but complete exclusion of sodium chloride (Herrmannsdorfer), salt being entirely excluded in the Gerson regimen, a halogen-free salt being used as a substitute, (2) fresh, uncooked vegetables and fruits bulk largely in the diet, either in the form of vegetable extracts prepared by pressing uncooked vegetables, such as carrots, beets, spinach turnips, or in the form of salads, with fruit juices similarly pre pared, (3) marked restriction of fresh meat, 600 grams weekly being allowed by Hermanns dorfer, while Gerson allows meat once or twice weekly, (4) one pint or more of fresh uncooked milk daily, sour milk, eggs (especially yolks) oatmeal, whole meal bread and farmaceous foods in restricted amounts, and (5) various spices used to increase the flavor of the dishes regimen also includes two medicinal preparations, mineralogen, a special blend of mineral salts of vegetable origin, and a phosphoric acid cod-liver oil preparation, both being administered three At the conclusion of the treatment times daily the patients return gradually to a more conventional diet, which however, still comprises the greater use of fresh vegetables and fruits and a judicious restriction of flesh foods

The Dangers of Salt Withdrawal in Pulmonary Tuberculosis -A Moeller, in an article in the Deutsche medizinische Wochen schrift of August 15, 1930 says that during a two year period the effect of withholding salt from the diet was watched in 23 tuberculous pa Since all food contains NaCl the diet was salt poor rather than salt-free Twelve pt tients rebelled after a few days, during which there had been a lowering of the general condition and a loss of mental concentration. Of the 11 who were persunded to keep up the regimen for at least six months, only 1 (in the first stage) was improved, in the second and third stages 3 were unchanged and 5 grew worse, and 2 in the third stage died. In no case did the bacilli disappear from the sputum. It is known that the tubercle bacilius requires no salt for its growth, ind dies it there is too much salt in the tissues Since the tuberculous patient loses salt through perspiration and might sweats and fever and

emacration also cause a considerable loss of mineral, the tissues of such patients are "hungry" for salt. In a second series of experiments for the purpose of comparing the intake and output of chlorine, sodium, sulphur and potassium, in 3 tuberculous patients, it was found for chloring and sodium that the amount excreted through all channels is uniformly less than the amount ingested, while the reverse is true for sulphur and potassium. Thus it is clear that the tuberculous system strives to retain salt to replace its losses Rabbits fed on a salt free diet developed symptoms of toxemia. Salt withdrawal may be fatal where there are digestive disturbances characterized by deficiency of hydrochloric acid. All the patients in these series suffered from deficiency of salt in the tissues and, to a less degree, from hypochlorinemia This deficit should be compensated by an abundant supply of salt in the A strong warning is uttered against any reduction of salt in the food of patients with pulmonary tuberculosis, such as is advocated in the Gerson-Sauerbruch method

Cardiac Arrest -- Thomas Mears states that the occurrence of cardiac arrest in the operating room is perhaps more frequent than we are inclined to think. It may be the cause of death in a large majority of the fatali ties that occur on the operating table, whether it be a primary cardiac failure or cardiac failure secondary to vasomotor relaxation Primary car diac arrest can be combated successfully by car diac massage Cardiac arrest secondary to vasomotor relaxation can be prevented by preserving the vasomotor tone during the operation and combited by raising the intracoronary tone through intra-arterial injections of fluid followed by intravenous injections of the same. In this type of arrest direct cardiac massage may also be of The success of the issue depends great value to a large extent, on the preparedness of the operating room to deal with such an emergency Rhythm must be restored to a quiescent heart within a period of six minutes if the individual is to be restored to complete normality reports the case of a colored woman, with marked general arteriosclerosis who was prepared for amputation of the right foot for senile gangrene After I few deep inhabitions of m trous oxide, the heart fuled. Attificial respiration, intracardiac injection of adrenalin, and intravenous injection of adrenalin into the left common carotid artery had no effect upon the heart or the respiratory function. An incision was then made through the soft parts and the costal cartilize from the third to the seventh ribs, permitting the insertion of the hand. At the third effort at emptying the rhythm was restored with force and regularity. The incision through the chest wall was closed and the lungs distended with curbon dioxide. The heart become quies cent for a cond time the cheet wound wa

quickly reopened, and with massage the heart again responded. The chest was now closed and During the folcarbon dioxide administered. lowing five hours there was no respiratory effort, but the heart rhythm remained good and systolic blood pressure was maintained at 180 mm. Each time the lungs were allowed to empty an effort at manipulating the epiglottis and arytenoids with the fingers was made, and finally continuous respiratory function was restored. The patient then went on for three hours, when the heart again failed and all restorative measures were without avail. In the face of advanced arterial disease this was a most unfavorable case for a good ultimate result .- Annals of Surgery, September, 1930, xcii, 3.

Subphrenic Abscess.—From a review of the literature and the study of 41 cases of subphrenic abscess observed at the Presbyterian Hospital of Chicago, Gatewood finds that the mortality in these cases is still far too high—30 per cent or more. True primary subphrenic abscesses are very rare. Most secondary abscesses are the result of direct spread of infection from such sources as perforation of the stomach, appendix, or gall-bladder, or they form as walled-off abscesses in general peritonitis. In the author's series perforation of the stomach or duodenum was the cause in 14 cases, extension of infection from the appendix in 10 cases and from the liver or gall-bladder in 7 cases. The importance of prophylactic treatment cannot be overemphasized. Early diagnosis of appendical and other contributory causes will prevent the formation of many subphrenic abscesses. In all lower abdominal infections adequate drainage and the adoption of the semi-sitting posture are the two most important preventive measures and should not be forgotten. One should not fail to consider the likelihood of subphrenic abscess in any patient not doing well after an abdominal operation, even though performed months previously. The diagnosis in early cases is ordinarily not Fever of the church-steeple variety, chills, and sweats are significant. Hiccough is always a suspicious sign, although it occurs in only about half of the cases. Cough mentioned by a number of authors was present in but few of the cases in this series. Other symptoms are shortness of breath, difficult breathing, and epi-Physical examination usually regastric pain. veals flatness on the infected side; breath sounds may sometimes be detected through the flattened area. Air in the abscess cavity may give a tympanic note instead of the flatness. Bulging in the epigastrium or on the affected side in the region of the lower ribs occurs in most late cases. Edema and redness of the overlying skin is frequently observed. The liver is usually displaced downward; the heart may be displaced upward. but never laterally (Tuft). The Roentgen rays give the most important information upon which to base the diagnosis; the diaphragm on the affected side is shown smoothly elevated. The treatment is essentially surgical as soon as a definite diagnosis is made, the method of approach being governed by the findings in the individual case. In the author's series 38 patients were operated upon, 27 being opened abdominally and 7 transpleurally.—American Journal of the Medical Sciences, September, 1930, clxxx, 3.

Digitalis Therapy in Lobar Pneumonia.— Although many opinions have been expressed concerning the therapeutic value of digitalis in lobar pneumonia, the literature fails to reveal any studies which present definite evidence that the use of the drug modifies the mortality of the disease. Therefore, Walter L. Niles and John Wychoff undertook a study of the effect of digitalis on the mortality rate in 835 lobar pneumonia cases observed in Bellevue Hospital during the years 1928 and 1929. The digitalis was given in divided dosage, no patient receiving more than 0.15 of a cat unit per pound of body weight, and the administration of the drug was stopped before this amount was given if toxic symptoms were observed. The tabulated results of the study show that for every 100 patients in the control group who died there were 122 fatalities in the digitalis-treated group. Owing to an error in standardization, one commercial preparation of digitalis employed was found to have a potency of 100 mg., equivalent to one cat unit, while a second preparation showed a potency of 66 mg., equal to one cat unit. As a consequence of this error some patients received an overdosage of digitalis. This led to the finding that overdosage with digitalis is not the sole cause for the higher mortality rate of the digitalistreated group. The mortality of the digitalistreated cases was higher than that of the corresponding controls in both the older and younger age groups. In all types of pneumonia, except Type II, the mortality of the digitalis-treated cases was higher than that of the controls. The factor of virulence was found to have no influence on the relative mortality in the control and the digitalis-treated cases. In the severe cases with positive blood cultures there was no difference in the mortality rates between the control and the digitalis-treated cases, while in the milder cases, with negative blood cultures, the mortality was 14.3 per cent higher for the treated group. The incidence of auricular fibrillation and auricular flutter was the same for both Although the committee under which this study was made prefers to continue the investigation, the opinion of its members is unanimous that thus far the results obtained do not justify continuing the routine administration of digitalis to lobar pneumonia patients.—American Journal of the Medical Sciences, September. 1930, clxxx, 3.

## LEGAL

## CONFIDENTIAL COMMUNICATION—WAIVER OF PRIVILEGE BY PATIENT

By Lorenz J Brosnan, Esq.
Connect Medical Society of the State of New York

The law, in its wisdom has very properly clothed the relation between patient and physician with a scorecy which prohibits the disclosure of confidential communications received by a physician in his professional capacity.

The statute in this State relating to confidential communications between physician and patient, as well as between nurse and patient, is found in Section 352 of the Civil Practice Act. This section reads as follows

"Sec 352 Physicians and nurses not to disclose professional information A person duly authorized to practice physic or surgery, or a professional or registered nurse, shall not be allowed to disclose any information which he acquired in attending a patient in a professional capacity, and which was neces sary to enable him to act in that capacity, unless where the patient is a child under the age of sixteen, the information so acquired indicates that the patient has been the victim or subject of a crime, in which case the physician or nurses may be required to testify fully in relation thereto upon any examination, trial or other proceeding in which the commission of such crime is a subject of mquiry"

Of course privileged communications may be waived by the voluntary act of the patient question has arisen several times in this State as to whether the law may read an implied waiver from some act of the patient. In a negligence case that arose some time ago, the most important issue on the trial related to the extent of the plaintiff's injuries. At the trial she called as a witness a physician who attended her after the accident and who testified that he treated her for a nervous condition The defendant's counsel elicited from the doctor on cross examination the fact that the physician had treated the plaintiff for nervousness before the action This testimony was objected to by the plaintiff's counsel on the ground that it was privileged, and the court below struck out all the testimony relating to the point of prior condition as testified to by the doctor, on the ground that the same was priv-

In holding that this was error the Appellate Division said

"By calling the physician as a witness the

plaintift waived her privilege \* \* \* ! We think that by calling the physician and examining him in reference to her condition after the accident, the plaintiff waived her privilege as to prior examinations, and it was permissible for the defendant to show, by cross examination, that the condition testified to by the witness existed prior to the accident?

The question has also arisen in an action against a physician for malpractice. In that case the plaintiff had been a sufferer from a chronic affection of the skin. The defendant, who wis her physician, on several occasions applied x-rays to her elbows, wrists and back. After the treatment, the plaintiff began an action against the physician to recover for injuries alleged to have resulted from the unskillfulness and negligence of the defendant in making such application.

Upon the trial the plaintiff called Dr X as a witness. This physician testified that he had treated the plaintiff for various skin lesions which the plaintiff claimed had been caused by the v-ray treatments. At the instance of the plaintiff Dr X described the condition of the plaintiff s skin as observed by him. On cross examination he was asked.

"Did you take a history of her case when she cime there?" To which he replied "Yes, sii? He was then asked "Will you tell me what it was?" To this question the plaintiff's attorney made the following objection. Objected to—con fidential communication between doctor and patient. And to the further question. "Did she tell you that she had suffered from St. Vitus Dance." the same objection was made. The court sustained the objection and ruled that the evidence was improper on the theory that "any communication between this doctor and plaintiff is absolutely and unqualifiedly improper and objection able."

In holding this to be error, the Appellite Division ruled that the plaintiff by calling and examining Dr X lifted the bir of privilege from all communications between him and her

The Court of Appeals of this State has sustained the Appellate Division in enunciating the principle that the plaintiff by commencing an action waves the privilege. This is not only sound law but common sense, since it would be inconsistent for the plaintiff to commence in action and then urge that much of the testinion.

that might be relevant was inadmissible because it was a privileged communication. The defend-

ant could not possibly present his defence if he

was robbed of the opportunity of showing to the jury material facts which might defeat the plaintiff's claim.

#### ALLEGED UNAUTHORIZED REMOVAL OF APPENDIX

In this case the doctor was consulted by the plaintiff and upon examination he diagnosed the ailment from which this patient was suffering to be an inguinal hernia, and suggested that an operation be performed. The patient agreed to undergo such operation and entered the sanitarium of which the doctor was President, and was in due course sent to the operating room. He was then put on the operating table and given a local anæsthetic of apothesine which completely anæsthetized the field. The proper incision for the operation was made and to the surprise of the doctor he found that the patient's appendix was in the hernial sac, badly inflamed. patient at the time was thoroughly conscious and talked with the doctor who informed him of the discovery of the appendix and advised him that it should be thereupon removed. The patient replied that by all means the doctor should take it out then and there.

The doctor next thoroughly cocainized the area around the appendix and performed the removal thereof. There was no pus and therefore no drain was necessary and the wound was closed.

The patient remained in the sanitarium for three weeks, during which time the doctor attended to the dressing of the wound, and at the time of his discharge from the sanitarium the patient's wound had completely healed.

Some time later the patient instituted an action against the surgeon for alleged malpractice. The complaint set forth that the plaintiff had merely employed the defendant to operate for hernia and that the defendant had represented that the operation was a simple one which could be performed under a local anæsthetic and in a few days recovery could be complete. It was further claimed that the removal of the appendix was entirely without the consent or authorization of the plaintiff; was unnecessary, and was only performed because of the negligence and unskillfulness of the surgeon in cutting too deep and too extensively into the plaintiff's abdomen. Plaintiff claimed that he had not been suffering from any appendix trouble and that the removal was wholly unnecessary, causing him a great deal of pain, loss of time, and a general weakening physically.

The plaintiff duly noticed the case for trial and at the time it was reached the defendant appeared with his witnesses but the plaintiff was not ready to proceed to trial.

Upon the defendant's motion therefor, the complaint was dismissed and judgment was entered in favor of the defendant.

#### CLAIMED NEGLIGENT TREATMENT OF POWDER WOUND

In this case, a boy of sixteen was wounded on the Fourth of July by a blank cartridge exploding, injuring the palm of his hand. The boy did not consult the defendant-doctor until two days later, at which time an examination showed that the wound was filled up with powder and smeared with a dirty salve.

The doctor opened and cleaned the wound and cut away the dead flesh, applying peroxide, bichloride of mercury and iodine. He applied a wet aluminum acetate dressing to the hand, and instructed the patient to return the next day. The patient made very light of his injury and did not return until two days later, when the doctor again treated the wound which appeared to be improving nicely.

The doctor next heard from the patient on July 9th, when he learned that the boy was in a hospital having developed tetanus. Antitoxin injections were made and while everything possible was done for the boy, in four days death occurred from lockjaw.

Nearly two years later, his administratrix instituted suit against the doctor, alleging that the boy's death was the result solely of the doctor's failure to apply the ordinary and recognized treatment for the prevention and cure of tetanus, and that the death was caused solely through the negligence of said doctor. The action, however, never came to trial and was duly dismissed, thereby terminating the proceeding in the doctor's favor.

### LONDON LETTER

1245

British Medical Association. The Annual Meeting of the British Medical Association has spent much time on a discussion of a proposed scheme for a Medical Service for the Nation The present position is that, of the entire population, some 16,000,000 are insured under the National Health Insurance Acts, and the proposal was that the time is now ripe for the inclusion under the National Insurance Service of the dependants of such insured persons. This would double the number of insured individuals and leave only some eleven million inhabitants of the country outside the Service. It has been long felt that in many ways the facilities obtainable under the Panel System, as it is called, fell short of the ideal, which is that every kind of service which may be necessary for the prevention and cure of disease should be at the disposal of every member of the community. At present many of what may be called the ancillary services are not provided for Panel patients. There are no consultants or specialists on the Panel, there is no provision of pathological or radiological services, home nursing is not provided for, and most important of all there is no arrangement under the Panel System whereby patients may be admitted to Hospital for institutional treatment. speaking these facilities have been obtained from the Voluntary Hospitals and it is not too much to say that without the willing cooperation of the Voluntary Hospitals, the Panel System must have proved a failure. It is generally anticipated that under the new Local Government Act (1930) there will be a very drastic reorganization of Health Services throughout the country, and there is a widespread belief that a State Medical Service for all is foreshadowed, and the British Medical Association scheme seems to be brought forward as an attempt to forestall such an eventuality. Many questions arise and will be answered differently according to one's predilections. Will a State Medical Service improve the health of the nation? Will it raise or even maintain the standard of medical knowledge and practice? Will it sap the selfreliance of the individual and lead him to rely more and more on the State to provide services that he should provide and pay for himself? Already we have gone a long way to release the

individual from his natural obligations. Preand post-natal clinics, the medical inspection of school children, the Panel medical service, unemployment pay and the Old Age Pension combine to smooth life's troubled way. But admirable in themselves as these may be proved to be, do they in the long run slacken the sense of responsibility, are they the "bread and circuses" of a modern decline and fall? I referred in a recent letter to Sir Arthur Keith's dictum on the inevitability of progress and raised the question whether progress was necessarily always forwards. The recent trend of public opinion at least with regard to medicine makes one inclined to doubt it.

This Is Woman's Year. A woman flies all alone to Australia, another wins the King's Cup for an aeroplane race round Britain, another wins the King's Prize at Bisley (we had thought that was safe from the intruding petticoat!) and now we have a new hospital, the Marie Curie Hospital, women-run for the relief of cancer. The hospital arose owing to the possession by the Cancer Research Committee of the Medical Women's Federation of a supply of radium valued at £12,000. This radium had been at the service of the four women's hospitals in London and had been passed from one to the other as required. Now it is to be housed in the new hospital which Mr. Stanley Baldwin, the late Prime Minister, opened on July 10th. Thirty beds are available and it is hoped to increase this number shortly to fifty, and only women will be admitted. The medical woman has had rather a chequered career since the war. At first several of the teaching hospitals opened their schools to women students and there was a not unreasonable hope that women would eventually obtain appointments on the staff; but gradually, for one reason and another, the facilities were withdrawn, and at the moment in London the Royal Free Hospital and its associated School of Medicine provides the main approach to a medical career for women. This new departure shows that women are alive to the necessity for specialization in the most obscure of diseases, and we may well hope that with this new opportunity for the study of cancer. research and experiment will go hand in hand to advance our knowledge and increase our methods of attack.

J. M. Carson, F.R.C.S. methods of attack.

Dr. J. M. Carson died suddenly on August thirty-first just after he had completed the London Letter for this issue. It is therefore with regret that this department of the JOHRMAL WIH necessarily be discontinued. However, the activity of the British Medical Association in investigating and solving tits local medical problems, justifies the hope that the department may be renewed in the near future—The Editors.

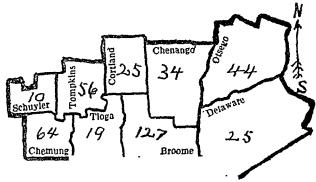

### NEWS NOTES

#### SIXTH DISTRICT BRANCH

The twenty-fourth annual meeting of the Sixth District Branch of the Medical Society of the State of New York was held on Tuesday, September 23, in the Alfred Corning Clark Gymnasium in Cooperstown, Otsego County, with the President, Dr. George M. Cady, of Nichols, presiding, and about 100 members in attendance. The morning program as printed was carried out as follows:

1. Address of Welcome: George M. Macken-

Counties of the Sixth District. The figures indicate the number of members of the County Medical Society.

zie, M. D. Director, Mary Imogene Bassett Hospital, Cooperstown.

2. Neurological Aspect of the Fractured Skull: Wardner D. Ayer, M. D., Associate Professor of Clinical Medicine and Neuropathology, Syracuse University School of Medicine. Discussion opened by Arthur S. Chittenden, M. D., Binghamton.

3. The Right of Injured Workmen to Select Their Own Physician: O. G. Browne, Esq., Assistant General Claims Attorney, New York Central Railroad. Discussion opened by Guy S. Carpenter, M. D., Waverly.

Dr. W. H. Ross, President of the Medical Society of the State of New York, showed a chart of the activities of the several county societies of the District, similar to that of the Third District, which he showed on September 19th in Albany. The chart was a record of those activities in which the county societies were directly interested and which they helped to establish or conduct. Other public activities along health lines are carried on independently of the county medical societies, such as public health nursing, and city laboratories. Graduate education had been particularly well done in the district.

Dr. Rassalso called attention to the social trend of the times in that the people expect the medical profession to supply all forms of medical service to all classes of people, the practising physicians cannot do this without the cooperation of governmental officials and voluntary welfare agencies. One of the most acute problems before the State Medical Society today is the establishment of that cooperation in every county under the leadership of the local physicians.

The managers of the Mary Imogene Bassett Hospital entertained the physicians at a noon luncheon served on the lawn of the hospital. The day and the setting were perfect for an outdoor

dinner, and the sociability of the occasion promoted society organization and efficiency.

A clinic was given after the luncheon by mem-

bers of the staff of the hospital

The following afternoon program was carried out:

1. The Tragedy of Appendicitis. Donald Guthrie, M. D. Robert Packet Hospital, Sayre,

Pa. Discussion opened by Frederick M. Miller, M. D., Binghamton.

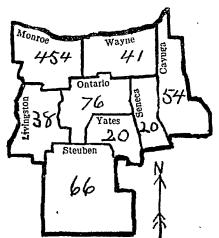

2. Mental Hygiene: Arthur J. Capron, M. D.,

The wives of the members, about thirty in number, were entertained at a luncheon at the Fennmore Hotel, and a boat ride on Otsego Lake, by the wives of the local physicians.

#### THE SEVENTH DISTRICT BRANCH

The Annual Meeting of the Seventh District Branch of the Medical Society of the State of New York was called to order promptly at 9:45 a.m. by President E. Carlton Foster in the Chapel of Keuka College, Penn Yan. The Chairmen of the several committees of the State Society, as well as Secretary Dougherty, reported briefly on their work throughout the State.

Following these reports the President of the Medical Society of the State of New York, Dr. William II. Ross, reported on the specific medical activities of the eight counties constituting the Seventh District Branch. His report was illustrated by a chart which gave detailed information of the medical meetings re-

Counties of the Seventh District. The figures indicate the number of members of the County Medical Society.

ported in the Journal in three years, of the graduate courses in the past three years, of the number of Tuberculosis Hospitals in operation to August 30, 1930, as well as the number of County Laboratories and of County Public Health Nurses. This presentation was interesting and well received.

The interests of the State Society were further presented by Assistant Commissioner of Public Welfare, Mr. Clarence E. Ford, who spoke on the "Administration of the New Public Welfare Law," This presentation brought up many inquiries which led to helpful discussions.

At 11:30, and exactly on scheduled time, Dr. John L. Eckel, of Buffalo, was introduced to the Society, who gave an interesting discussion upon "Anterior Poliomyelitis" which he said was first described in 1840. Since that time many studies of the disease have been made, but as yet the cause is not known, except that it is due to a "filtrable virus." Since the epidemic of 1910, cases are reported more frequently, and yet there are many cases apparently not reported because of not being recognized, or for other reasons.

It occurs most frequently between the age of three and eight years, though it may occur at any age. The virus probably gains access to the body mostly through the upper respiratory tract. It has an incubation period from seven to eight days. It affects the nervous system primarily, producing its lesion principally in the anterior horn cells of the spinal cord. This may produce a more or less extensive paralysis. The bulbus type is most frequent. An acute Landry's type may arise and cause rapid death.

The disease begins usually as a mild febrile one, which may be entirely overlooked. The child becomes languid and irritable, and may show gastro-intestinal disturbances. The reflexes are next disturbed, and if a spinal puncture is done the examination may show

attended. On March 21, Dr. Frederick W. Rice gave a talk on "Toxæmias of Pregnancy," to an audience of about 45.

On Friday, April 4, Dr. Clyde W. Collings spoke on "Genito-Urinary Conditions" with lantern slide illustrations. Attendance 35.

Dr. Mencken presented checks to the amount of \$230, the receipts for special courses.

The Committee on Medical Economics made the following suggestions:

- 1. That we look into the matter of the cost of medical education.
- 2. That we take up the matter of refuting pernicious magazine articles, such as one that appeared in a recent issue of a magazine called "Liberty"; the article on "Medical Ethics and Economics," written by Clara Robinson.
- 3. The question of an increase in pay for fulltime Health Department physicians, not only in Queens County, but throughout the greater city.
- 4. The fact that hospital fees are too high for the average white collar man.
- 5. The question of interstate licensing reciprocity and the influx of foreign physicians. It was brought out that the preliminary education requirements in foreign countries, since 1914, were far inferior to those required by American students, and because of this, the foreign physician was able, at a much younger age, to secure a diploma, and by presenting credentials to the State, receive a license to practice in the State of New York. This was unfair to American physicians. Citizenship is not required; this should be investigated.
- 6. The question of counter prescribing and treatment by druggists.
- 7. The question that certain institutions are practicing medicine without a licensed physician in attendance.
- 8. The idea of having open discussions of economic questions at each meeting allowing from ten to twenty minutes for such discussions, at which time various complaints or criticisms, both constructive and destructive can be made.
- 9. The question of inserting in the Bulletin a request to the membership of the County Society at large to write to the Committee any items that refer to any economic problems.
- 10. The Committee feels that if progress in Queens County follows along the lines of precedences established by other county societies, then various sections will be formed, the membership dividing itself into groups of specialists. who will have their own scientific sessions; and at the general meeting we will deal with problems of public health, medical

ethics, medical economics, topics outside of purely scientific investigation, together with papers of common interest to the medical profession at large.

The Committee on Publicity, through the Chairman, reported the publication of the March Bulletin and advised that more advertisements be carried in the Bulletin; also the desirability of stressing certain new features.

Dr. Boettiger reported for the Committee on Public Health and Public Relations, a meeting on March 4, 1930, five members in attendance, at which the following matters were reported:

It was proposed to organize a special committee of the Public Health Committee as an Advisory Board to the physicians of the Department of Health. This Committee to be composed of various men representing various specialties in medicine. They would furnish technical assistance and advice in special cases. The Comitia Minora gave their approval of this plan. The further report was published in the Bulletin.

The president reported attendance at a meeting called by the Commissioner of Health which considered the matter of objectionable advertising by physicians particularly in New York newspapers published in foreign languages. The president further reported attending a meeting of officers of the Long Island County Societies.

Dr. Mencken reported in the matter of appointments for the medical staff of the new city hospital to be constructed in Queens. On motion, he was appointed a special committee to investigate the matter.

The Secretary moved that the foregoing report of the Comitia Minora be accepted and its recommendations approved. Seconded and unanimously passed.

The following new members were elected: Active Members:

Julius Blackfein, M.D., Flushing. Robert E. Carter, M.D., Jamaica.

Gustin T. Kiffney, M.D., Springfield Gardens

David M. Morgenstern, M.D., Richmond Hill

John George Stubenbord, 3rd, M.D., Douglaston.

Associate Members (Class C)

Henry H. Burth, M.D., Jamaica.

Theodore E. P. Koszalka, M.D., Mary Immaculate Hospital.

Associate Members (Class B)

Frank N. Dealy, M.D., New York City. Attendance 110.

E. E. SMITH, Secretary.

dinner, and the sociability of the occasion promoted society organization and efficiency.

A clinic was given after the luncheon by members of the staff of the hospital

The following afternoon program was carried out:

1. The Tragedy of Appendicitis: Donald Guthrie, M. D. Robert Packer Hospital, Sayre,

Pa. Discussion opened by Frederick M. Miller, M. D., Binghamton.

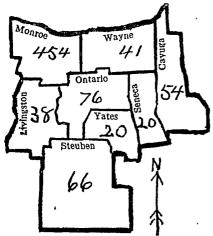

2. Mental Hygiene: Arthur J. Capron, M. D., Owego.

The wives of the members, about thirty in number, were entertained at a luncheon at the Fennmore Hotel, and a boat ride on Otsego Lake, by the wives of the local physicians

#### THE SEVENTH DISTRICT BRANCH

The Annual Meeting of the Seventh District Branch of the Medical Society of the State of New York was called to order promptly at 9:45 a.m. by President E. Carlton Foster in the Chapel of Keuka College, Penn Yan. The Chairmen of the several committees of the State Society, as well as Secretary Dougherty, reported briefly on their work throughout the State.

Following these reports the President of the Medical Society of the State of New York, Dr. William II. Ross, reported on the specific medical activities of the eight counties constituting the Seventh District Branch. His report was illustrated by a chart which gave detailed information of the medical meetings re-

Counties of the Seventh District. The figures indicate the number of members of the County Medical Society.

ported in the Journal in three years, of the graduate courses in the past three years, of the number of Tuberculosis Hospitals in operation to August 30, 1930, as well as the number of County Laboratories and of County Public Health Nurses. This presentation was interesting and well received.

The interests of the State Society were further presented by Assistant Commissioner of Public Welfare, Mr. Clarence E. Ford, who spoke on the "Administration of the New Public Welfare Law." This presentation brought up many inquiries which led to helpful dis-

cussions.

At 11:30, and exactly on scheduled time, Dr. John L. Eckel, of Buffalo, was introduced to the Society, who gave an interesting discussion upon "Anterior Poliomyelitis" which he said was first described in 1840. Since that time many studies of the disease have been made, but as yet the cause is not known, except that it is due to a "filtrable virus." Since the epidemic of 1910, cases are reported more frequently, and yet there are many cases apparently not reported because of not being recognized, or for other reasons.

It occurs most frequently between the age of three and eight years, though it may occur at any age. The virus probably gains access to the body mostly through the upper respiratory tract. It has an incubation period from seven to eight days. It affects the nervous system primarily, producing its lesion principally in the anterior horn cells of the spinal cord. This may produce a more or less extensive paralysis. The bulbus type is most frequent. An acute Landry's type may arise and cause rapid death.

The disease begins usually as a mild febrile one, which may be entirely overlooked. The child becomes languid and irritable, and may show gastro-intestinal disturbances. The reflexes are next disturbed, and if a spinal puncture is done the examination may show

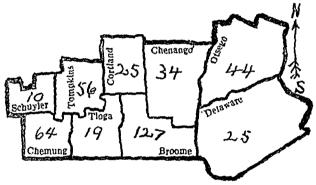

### NEWS NOTES

#### SIXTH DISTRICT BRANCH

The twenty-fourth annual meeting of the Sixth District Branch of the Medical Society of the State of New York was held on Tuesday, September 23, in the Alfred Corning Clark Gymnasium in Cooperstown, Otsego County, with the President, Dr. George M. Cady, of Nichols, presiding, and about 100 members in attendance. The morning program as printed was carried out as follows:

1. Address of Welcome: George M. Macken-

Counties of the Sixth District. The figures indicate the number of members of the County Medical Society.

zie, M. D. Director, Mary Imogene Bassett Hos-

pital, Cooperstown.

2. Neurological Aspect of the Fractured Skull: Wardner D. Ayer, M. D., Associate Professor of Clinical Medicine and Neuropathology, Syracuse University School of Medicine. Discussion opened by Arthur S. Chittenden, M. D., Binghamton.

3. The Right of Injured Workmen to Select Their Own Physician: O. G. Browne, Esq., Assistant General Claims Attorney, New York Central Railroad. Discussion opened by Guy S. Carpenter, M. D., Waverly.

Dr. W. H. Ross, President of the Medical Society of the State of New York, showed a chart of the activities of the several county societies of the District, similar to that of the Third District, which he showed on September 19th in Albany. The chart was a record of those activities in which the county societies were directly interested and which they helped to establish or conduct. Other public activities along health lines are carried on independently of the county medical societies, such as public health nursing, and city laboratories. Graduate education had been particularly well done in the district.

Dr. Rassalso called attention to the social trend of the times in that the people expect the medical profession to supply all forms of medical service to all classes of people, the practising physicians cannot do this without the cooperation of governmental officials and voluntary welfare agencies. One of the most acute problems before the State Medical Society today is the establishment of that cooperation in every county under the leadership of the local physicians.

The managers of the Mary Imogene Bassett Hospital entertained the physicians at a noon luncheon served on the lawn of the hospital. The day and the setting were perfect for an outdoor

#### COMMITTEE ON ECONOMICS

This Journal of September 15 carried a general account of the activities of the Committee on Economics of the Medical Society of the State of New York, of which Dr. George F. Chandler is chairman. The committee has issued three Bulletins. Number One, dated July first, was introductory and requested each county society to form a Committee on Economics.

Bulletin Number Two described a conference which the Committee held with represen-

tatives of labor organizations.

Bulletin Number Three was a brief description of the activities of the Milbank Memorial Fund.

Bulletin Number Two, dated July 15, was as

follows:

At a meeting held in New York City before the Industrial Commissioner of the State of New York, June 16th, 1930, and which was attended by representatives of Insurance Companies, Labor Unions, the President of the State Medical Society and its Executive Secretary, Dr. Rosenthal representing the New York County Medical Association, and Dr. Chandler, Chairman of the State Committee on Medical Economics, the following resolution was adopted:

The following tentative plan introduced by Dr. Rosenthal was accepted subject to the ap-

proval of the Insurance Companies:

1. The Metropolitan County Societies will establish in each Borough a joint committee of carriers and physicians (representative of the stock companies, the mutual companies, and of the County Societies) to act as an arbitration board for the settlement of disputed bills between physicians and carriers. This board to meet as often as necessary.

Physicians when submitting bills for services are to abide by a fee schedule to be evolved jointly by the County Medical Society and the

carriers.

3. Physicians are to submit the c-4 forms as soon as possible, within the stipulated time, to cooperate with the carriers, furnishing reasonable information requested, and to submit

promptly an itemized bill.

- 4. Physicians will agree to abide by the decision of the carriers and the County Society regarding consultations, x-rays, etc. Physicians will permit the medical representatives of the carriers to examine claimants at reasonable times.
- 5. Carriers will permit physicians to treat compensation cases without specific authorization.
- 6. Carriers will agree to pay medical bills within a reasonable time.

7. Carriers will agree to furnish literature or

other means, for the information of the physicians, so that the work may be carried on at a high level of efficiency.

Measures will be taken to include in this agreement, fees, equipment, and training for

physical therapy.

It was agreed that the details of paragraphs 1, 2, 4 and 7 are to be evolved by a joint committee of the carriers and of the County Medical Society.

It will be clearly seen that this resolution will accomplish what has been in the minds of physicians for the past few years but this resolution pertains to the metropolitan county so-

cieties only,

The Insurance Carriers stated at this meeting that they would act through our committee to bring about the same situation in the

remaining counties of the State.

In order to do this we respectfully ask that each county appoint a Medical Economic Committee consisting of a Chairman and one or two members. So that our committee will be in touch with each county society, we ask that this be done at once and that the names and addresses of the members of the committees be forwarded at once to Dr. George F. Chandler. 11 East Chestnut St., Kingston, N. Y. After the metropolitan district have adjusted the fee schedule, we shall ask each county Economic Committee to submit a fee schedule based upon that of the county societies of the metropolitan district but modified of course by local conditions by which we mean distances traveled and ordinary office fees together with what the patients are able to pay normally.

This resolution you will notice, allows physicians to treat compensation cases without specific authorization,—which is a big step

in advance.

As soon as the fee schedule of the metropolitan counties has been agreed upon, copies of this will be immediately forwarded to the County Economics Committees so that the matter can be thrashed out in the County Societies, and the results of these meetings are to be forwarded at once to the Chairman of the Medical Economics of the State. The Insurance Companies agreed to this and agreed to deal directly with our committee and through the County Societies.

This matter is of such vital importance that we ask for action not later than the first of October of this year so that it will become a working basis for all Counties by the first of

November of 1930.

GEORGE F. CHANDLER,

Chairman, Committee on Medical Economics.

### GRADUATE COURSES

The following courses have been arranged by the Committee on Public Health and Medical Education of which Dr. Thomas P. Farmer of Syracuse, is chairman.

The following course in Heart Disease for Rockland County has been prepared by Dr.

John Wyckoff of New York City.

October 1—"Cardiac Structure and Its Disorders," Dr. C. E. De la Chapelle, 59th Street and Fifth Avenue, New York City.

October 8—"Cardiac Functions and Their Disorders,"
Dr. Arthur C. DeGraff, 75 East 55th Street,
New York City.

October 15—"Rheumatic Fever and Rheumatic Heart Disease," Dr. Irving Graef, Bellevue Hospital, New York City.

October 22—"Hypertension and Hypertensive Heart Disease," Dr. William Goldring, 150 East 52nd Street, New York City.

October 29—"Syphilitic and Arteriosceloritic Heart Discase," Dr. John Wyckoff, 75 East 55th Street, New York City.

This course was also given in Seneca Falls, Seneca County, in the afternoon, and in Newark, Wayne County (including Ontario County), in the evening, on September 4, 11, and 18, and October 2 and 9.

The following course in tuberculosis, for Monroe and Genesee counties has been arranged by Dr. E. R. Baldwin, Saranac Lake, to be given in Rochester at 4:30 P.M. and at Batavia at 8:30 P.M.

October 20—"Review of the Progress of the Control of Tuberculosis and the Advances in Pathology and Bacteriology," Dr. E. R. Baldwin, Saranac Lake, New York.

October 21—"Diagnosis and the Differential Diagnosis from Conditions Such as Hyperthyroidism,"
Dr. John N. Hayes, Saranac Lake, New York.

October 22—"Tuberculosis in Children," Dr. H. St. John Williams, Poughkeepsie, New York.

October 23—"The Surgical Treatment of Tuberculosis,"
Dr. Adrian Lambert, New York City.

October 24—"Treatment in General," Dr. J. Woods Price, Saranac Lake, New York.

The following course in Periodic Health Examinations was arranged for Tioga County by Dr. Otto H. Leber, of New York City:

September 16th, at Owego—"Periodic Health Examinations," Dr. C. Ward Crampton, 515 Park Avenue, New York City.

September 30th, at Waverly--"Periodic Health Examinations in Children," Dr. Wm. St. Lawrence, 983 Park Avenue, New York City.

October 7th, at Owego—"Periodic Health Examination of Women," Dr. Emily Barringer, 134 East 76th Street, New York City.

October

14th, at Waverly—"The Practical Relation of Periodic Health Examination to the Practice of Medicine Today," Dr. Otto H. Leber, 580 Park Avenue, New York City.

The following course in the Relation of Specialties to General Medicine was arranged for Cortland County by Dr. Alan R. Anderson, Dean of the Post-Graduate Medical School of New York City.

September 19—"The Relationship of Ophthalmology to General Medicine," Dr. Martin Cohen, 1 West 85th Street, New York City.

October 3—"The Relationship of Dermatology to General Medicine," Dr. Joseph Jordan Eller, 100 West 59th Street, New York City.

October 17—"The Relationship of Laboratory to General Medicine," Dr. Ward J. MacNeal, Post-Graduate Hospital, New York City.

October 31—"The Relationship of Proctocology to General Medicine," Dr. John D. Stewart, 580 Park Avenue, New York City.

November 14—"The Relationship of Laryngology to General Medicine," Dr. Duncan MacPherson, 114 East 54th Street, New York City.

December 5—"The Relationship of Otology to General Medicine," Dr. Marvin F. Jones, 121 East 60th Street. New York City.

The following "Clinical Day" program was arranged for Washington County, on Thursday, October 2, 1930.

MEDICAL CLINIC—"Management of the Gall Bladder Patient," Dr. I. H. Levy.

MEDICAL CLINIC—"Coronary Thrombosis," Dr. E. C. Reifenstein.

SURGICAL CLINIC—"Ostcomyelitis," Dr. E. S. Van Duyn.

NEUROLOGICAL CLINIC—"Cerebral Aneurysms," Dr. Wardner D. Ayer.

LABORATORY CLINIC—"Infections Due to Higher Bacteria," Dr. O. W. H. Mitchell.

This is a preliminary program. There may be some changes in the subjects and in the order of the lectures.

#### DEDICATION GRANVILLE HOSPITAL

On September 19th the dedication of the Emma Laing Stevens Hospital of Granville in Washington County was held at the new High School auditorium, Dr. D. C. McKenzie, of Granville, presided at the ceremonies.

Lieutenant Governor Herbert H. Lehman was the principal speaker. He emphasized the necessity for small private hospitals in rural sections saying that it was not only a humanitarian work, but that he felt sure there was a decided economic value to the community in

such institutions.

Dr. McKenzie pointed out that the hospital was now full, that they had the "usual deficit,"

and that he was depending upon the people of the community to come forward and meet it.

Colonel P. J. Esquere made a very interesting address in which he pointed out ways whereby money could be raised for the hospital. He made the suggestion that during the winter the women giving bridge parties should be taxed fifty cents each for each party, and that the sum total at the end would probably run the hospital. He stated "You play bridge much and very well, and you want to make it count for something."

W. L. Munson.

#### QUEENS COUNTY MEDICAL SOCIETY

A stated meeting of the Queens County Medical Society was held in the Society Building on April 29, 1930, at 8:30 P.M. with the president, Dr. E. A. Flemming, in the chair.

The following scientific program was car-

ried out:

1. Paper, "The End Results in the Treat-

ment of Eclampsia," by Alfred C. Beck, M.D.
2. Talk, "The Discussion of Some Obstetrical Problems," by George Livingston Brod-

head, M.D.

3. Discussion of Drs. J. P. McManus, H. C. Eichacker, H. L. Langer, G. J. Lawrence, and II. C. Courten, and closed by Drs. Beck and Brodhead.

The Comitia Minora reported as follows:

A regular meeting of the Comitia Minora was held at the home of the president, E. A. Flemming, M.D., on April 12th, 1930, at 8:30 P.M. Drs. E. A. Flemming, A. L. Voltz, E. E. Smith, T. C. Chalmers, Carl Boettiger, W. J. Lavelle, F. G. Riley, J. S. Thomas, James R. Reuling, H. C. Eichacker, and H. P. Mencken, were in attendance. The Counsel, Mr. Huber, also sat with the Comitia.

On recommendation of the Board of Censors applicants were approved for election to

membership,

Applications were received and referred to the Board of Censors,

The Secretary read a communication from one of the members renouncing his relation to the Koch treatment for cancer.

The Secretary read a communication from the Secretary of the State Society in the matter of the appeal of Samuel I. Muller, stating that the "Board of Censors ruled that the matters embraced in the above entitled appeal be remitted to the Board of Censors of the Medical Society of the County of Queens, with a further ruling that the said Board accord to the appellant a hearing, provided, however, that the said appellant shall first file written charges with the president of your Society in accordance with the terms and provisions of your By-Laws." No action was taken.

The Secretary read the inquiry of Dr. Richard Kovacs regarding the action of the Society on physiotherapists and the reply of the Secretary thereto. The members present were in agreement with the facts as set forth in the

letter of the Secretary.

The Secretary read, for information, the communication from Senator John A. Hastings relative to a hearing on the Hastings Bill before the Senate Finance Committee,

The Secretary read a communication setting forth resolutions adopted by the Bronx Medical Alliance advising the discontinuance of the treatment clinics operated by the Board of Health. No action was taken.

Dr. Chalmers, chairman, reported in the matter of the audit of the Bazaar Fund and

the building account.

Dr. H. P. Mencken reported for the Com-

mittee on Graduate Education.

The third meeting of the Graduate Education Committee was held in the Society Building on Thursday, March 20th. Drs. Mencken, Prest, Steffens, Victor, Langer, Smith and Veprovsky in attendance.

Twenty-six physicians applied for the various postgraduate courses and twenty-three were accepted: obstetrics, 8; surgery, 7; medical diagnosis, 4; dermatology, 3; contagious diseases, 3; clinical pediatrics, 1.

The Friday afternoon talks were fairly well

attended. On March 21, Dr. Frederick W. Rice gave a talk on "Toxæmias of Pregnancy," to an audience of about 45.

On Friday, April 4, Dr. Clyde W. Collings spoke on "Genito-Urinary Conditions" with lantern slide illustrations. Attendance 35.

Dr. Mencken presented checks to the amount of \$230, the receipts for special courses.

The Committee on Medical Economics made the following suggestions:

- 1. That we look into the matter of the cost of medical education.
- 2. That we take up the matter of refuting pernicious magazine articles, such as one that appeared in a recent issue of a magazine called "Liberty"; the article on "Medical Ethics and Economics," written by Clara Robinson.
- 3. The question of an increase in pay for fulltime Health Department physicians, not only in Queens County, but throughout the greater city.
- 4. The fact that hospital fees are too high for the average white collar man.
- 5. The question of interstate licensing reciprocity and the influx of foreign physicians. It was brought out that the preliminary education requirements in foreign countries, since 1914, were far inferior to those required by American students, and because of this, the foreign physician was able, at a much younger age, to secure a diploma, and by presenting credentials to the State, receive a license to practice in the State of New York. This was unfair to American physicians. Citizenship is not required; this should be investigated.
- 6. The question of counter prescribing and treatment by druggists.
- 7. The question that certain institutions are practicing medicine without a licensed physician in attendance.
- 8. The idea of having open discussions of economic questions at each meeting allowing from ten to twenty minutes for such discussions, at which time various complaints or criticisms, both constructive and destructive can be made.
- 9. The question of inserting in the Bulletin a request to the membership of the County Society at large to write to the Committee any items that refer to any economic problems.
- 10. The Committee feels that if progress in Queens County follows along the lines of precedences established by other county societies, then various sections will be formed, the membership dividing itself into groups of specialists, who will have their own scientific sessions; and at the general meeting we will deal with problems of public health, medical

ethics, medical economics, topics outside of purely scientific investigation, together with papers of common interest to the medical profession at large.

The Committee on Publicity, through the Chairman, reported the publication of the March Bulletin and advised that more advertisements be carried in the Bulletin; also the desirability of stressing certain new features.

Dr. Boettiger reported for the Committee on Public Health and Public Relations, a meeting on March 4, 1930, five members in attendance, at which the following matters were reported:

It was proposed to organize a special committee of the Public Health Committee as an Advisory Board to the physicians of the Department of Health. This Committee to be composed of various men representing various specialties in medicine. They would furnish technical assistance and advice in special cases. The Comitia Minora gave their approval of this plan. The further report was published in the Bulletin.

The president reported attendance at a meeting called by the Commissioner of Health which considered the matter of objectionable advertising by physicians particularly in New York newspapers published in foreign languages. The president further reported attending a meeting of officers of the Long Island County Societies.

Dr. Mencken reported in the matter of appointments for the medical staff of the new city hospital to be constructed in Queens. On motion, he was appointed a special committee to investigate the matter.

The Secretary moved that the foregoing report of the Comitia Minora be accepted and its recommendations approved. Seconded and unanimously passed.

The following new members were elected: Active Members:

Julius Blackfein, M.D., Flushing. Robert E. Carter, M.D., Jamaica.

Gustin T. Kiffney, M.D., Springfield Gardens

David M. Morgenstern, M.D., Richmond

John George Stubenbord, 3rd, M.D., Douglaston.

Associate Members (Class C)

Henry H. Burth, M.D., Jamaica. Theodore E. P. Koszalka, M.D., Mary Immaculate Hospital.

Associate Members (Class B)

Frank N. Dealy, M.D., New York City. Attendance 110.

E. E. SMITH, Secretary.

#### QUEENS COUNTY MEDICAL SOCIETY

A stated meeting of the Society was held in the Society Building on May 27, 1930, at 8 30 P. M., president E. A. Flemming, M. D., in the chair.

The following new members were elected:

Dewitt R. S. Barnes, M.D., Long Island City, Frank Joseph Cerniglia, M.D., Forest Hills West, Fred M. Weiss, M.D., Astoria

The transfer of membership from the Multonomah County Medical Society, Oregon, of Charles

George Rattner, M.D., was announced.

The Comitia Minora reported as follows:

The Secretary read a leter from Dr. Harold Rypins announcing that a representative of the New York State Board of Medical Examiners would be present at all times at 49 Chambers Street, New York City, to receive complaints in reference to violations of the educational law as to the practice of medicine and dentistry, and requesting that such complaints be directed to the Attorney General's office Alleged violations without evidence on which to base a prosecution should be sent directly to Dr Rypins.

The report of the Treasurer was presented, storying an income since March 8th last of \$2,357.15, and disbursements of \$4,382.90, balance in check account, Bank of Manhattan, \$5,174.97. The report was received and ordered placed on fle.' The Treasurer reported bills on hand to the amount of \$3,874.45. These were approved for

payment.

The Committee on Public Health and Public Relations, through the chairman, Dr. Carl Boettiger, reported that Dr. Reisman had attended two meetings during the past month to discuss the subject of the examination of pre-school children. These meetings were held in Manhattan and were for the purpose of extending the work done in this county to the other parts of the city. Dr. Reisman was appointed a committee to prepare publicity for the press on this important matter.

Dr. Reisman was also authorized to write an article for the next Bulletin on the same subject to stimulate our own members to keep their interest in this work. He was also asked to prepare a form letter to be sent to all the mother's clubs in this county, calling their attention to the necessity of having all of these children examined, and asking them to give publicity to the subject at their meetings.

Dr. R. Boenke spoke for the State Committee on Physiotherapy at whose meetings he had been present. He stated that he was now engaged in making a personal canvass of all practicing physiotherapists in the County. So far he had found one who was practicing medicine, and this one was promptly prosecuted by the state after he was reported, and has closed up his office and left.

Dr. Barry spoke for the Five County Committee on Annual Health Examination stating that he had attended two meetings during the month.

The Chairman read a letter from Dr. Martin of the Department of Health regarding the physical examination of children in the continuation schools and was authorized with Dr. Reisman to organize a sub-committee of the Public Health Committee to care for this matter.

Dr. H. P. Mencken, chairman of the Committee on Graduate Education, reported that at the Friday afternoon talk by Hon. James T. Hallinan on "Medical Jurisprudence," between forty to fifty were in attendance. At the conclusion of his address Mr. Hallinan spoke of the building of the new hospital for Queens and of the expectation of the ground being broken in September, and stated, as his opinion, that this hospital should be staffed by the physiciaus of Queens and only men who are members of organized medicine. This talk was reported in the public press.

The president presented a report from the Membership Committee, through its chairman, Frederick C. Courten, M.D., who stated that the Committee had covered nearly half the eligibic physicians in the county, and that from now on the remainder would be canvassed. No attempt was made to interest doctors graduated prior to 1900 except in special cases. In the future it would be necessary to solicit only recent graduates.

The president brought up the matter of preventive examinations and treatment of pre-school children. On motion, duly seconded and passed, a letter from Commissioner Wynne, covering that point, was referred to the Committee on Public Health and Public Relations, to report to the Comitia Minora.

The president announced the death of Robert F. Macfarlane, M.D., senior member of the Society, and on motion, duly seconded and passed, the Treasurer was instructed to send flowers for the Society to the funeral. The members of the Comitia were instructed to attend the funeral, so far as they were able to do so, representing the Society.

At the scientific session, Dr. Ira S. Wile addressed the meeting on "Behavior Problems in Children with Special Reference to Delinquency." The discussion was participated in by Justice Samuel D. Levy, Children's Court, New York City; Counselor William J. Morris, Jr., Former District Attorney, Queens; Miss Lucille Nicol, District Superintendent, Board of Education, Queens; and Leopold M. Rohr, M.D., Queens.

Attendance 137.

### THE DAILY PRESS

### WORMS AND GERMS And Good. Too.

N Y. Herald Tribune, August 20, 1930.

#### NEW CANCER PUBLICATION

The American Society for the Control of Cancer expects the hearty cooperation of the medical profession and yet it chose the daily press as the medium for announcing an important item of its plans. The New York *Herald Tribune* of October 3 says:

"'The American Journal of Cancer,' a new scientific publication that will have the broadest scope of any journal in the world dedicated to that disease, will make its first appearance on January 1 under the editorship of Dr. Francis Carter Wood, director of the Crocker Institute of Cancer Research at Columbia University, it was revealed yesterday at a luncheon in the New York Athletic Club, given to the press by the executive committee of the American Society for the Control of Cancer.

"The announcement of the forthcoming publication grew out of a discussion between representatives of newspapers and cancer specialists on the best method to facilitate cooperation between the two groups in educating the public on cancer protection and cure.

"Dr. Wood explained that the new cancer journal would aim to contain within its pages a reprint, a criticism or an abstract of every paper on cancer published anywhere in the world in any language. Thus an American reader who only knows English will be able to keep in touch with cancer research the world over.

"Dr. Wood said that the new journal would be the official organ of the American Society for the Control of Cancer and of the American Society of Cancer Research. It will be a greatly enlarged continuation of the old 'Journal of Cancer Research.'

"In addition to the scientific papers which the old magazine contained, the new publication will publish clinical reports and educational articles written in unscientific English for the benefit of laymen.

"Perhaps the most valuable aspect of the new journal, Dr. Wood insisted, is that it will be able to carry out whatever program is considered advisable without being hampered by the necessity of considering the cost. Whatever funds are needed will be supplied by the Chemical Foundation, Inc., of which Francis P. Garvan is president.

"'Although the subscription price will be only \$5 a year, we will be able to publish articles in their best form irrespective of cost,' Dr. Wood said in explaining that in ordinary medical journals lack of funds often requires the publication of short articles and a limitation in the number and type of cuts used. A 200-page article already had been accepted for the new publication, he said

"For the present the new journal will appear quarterly, but later it probably will appear more often."

#### THE STEALTHY GERM

James I. Montague writing in the New York Herald Tribune of October 3 gives a fairly good description of a disease germ and its stealthy ways. Possibly the following verses will be more attractive and produce more effect than pages of scientific appeal:

Malicious microscopic mite. Safe hid from view, you park And never wage an open fight, But stab me in the dark. The bolder bugs before they sting At least burst forth in song. But you do not; besides, you bring Your gang along.

You lie in wait in stagnant pools Or lurk upon the floor; You wholly disregard the rules That should obtain in war. And if but you survive attack, You sternly carry on And have a billion at your back Before the dawn.

Whenever, in abundant health, I turn my mind to toil, You come with all your mob by stealth To pillage and despoil. And then I feel bowed down with care And prematurely old, And lie in bed and wonder where I got that cold.

If you were like the elephant In height and bulk and girth, A bullet in you I could plant And fell you to the earth, An equal forman I could love, But you I must despise Because you take advantage of Your size.

\$200,000 to make up the \$2,000,000 sought.

During the last three years 40,000 Americans

have assisted in raising that amount. Already some of the money has been used to build and

equip the fine leprosarium at Cebu in the

Philippines and to purchase a hospital boat, The balance of the fund will be used to sup-

port the scientific study of leprosy and to dis-

seminate knowledge of the disease and its

great personal sacrifice in combating leprosy

"The hope of those who are engaged at

#### LEPROSY HOSPITAL ENDOWMENT

treatment.

An account of a campaign sponsored by \$2,000,000 at Culion, Philippine Islands, was printed in this Journal of October 1, 1928, page contains the following account of the work of

General Wood to endow a leprosy hospital for 1186. The New York Sun of September 29 the hospital:

"The American flag flies over an isolated island in the China Sea where 5,000 lepers are quarantined in the colony of Culion. There doctors and nurses from the United States and the Philippines are working to control one of the world's most dreaded scourges. What stirs them to ever more zealous endeavors is the knowledge that their fight no longer is in vain and that they may draw for resources upon the fund raised for their work by the Leonard Wood Memorial for Eradication of Leprosy.

springs from the knowledge that since 1922 more than 2,000 sufferers have been dismissed from the Culion colony as cured. These former patients, many of whom had been carried by force to the hospital, are now at work, They present living evidence of the effectiveness of that medical research which, through the Leonard Wood Memorial Fund, eventually

may reduce leprosy the world over."

"A final appeal is issued this week for public contributions to advance the medical work at Culion. The fund now lacks less than

#### SUNBURN

The New York Times of August 27 discusses susceptibility to sunburn editorially under the title "Heliotropes and Heliophobes" and says: "Modern sun-worshipers are ready to go

through fire and water to achieve the glory of a tanned skin.

"Every year 200,000 working days are lost

because of illness due to sunburn, which represents an annual loss of \$1,400,000. A large part of this sum must come from the pockets of heliophobes (those who do not tan). If they will realize the futility of trying to change their skins, they will save time and money and escape suffer-

### BOOKS RECEIVED

- Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

### BOOK REVIEWS

Clinical Obstetrics By Pati I Harler Ph B M D Octavo of 629 pages illustrated Philadelphia, I A Davis Company 1930 Cloth \$8.00

This volume is concerned with a description of the natural phenomena of particular with detailed consideration of the abnormalities of pregnancy labor and the pure persuance tegether with a description of operative measures applicable to them.

The book is distinctly for the advanced student the

prictitioner and the specialit in obstetrics

The author has had considerable experience with the contraction ring and retraction ring dystocia and his description of the physiology the pithology and the treatment of this condition is excellent

The illustrations are different from those in most textbooks. They are simple diagrams with appropriate legends which are a great help to the reader in

visualizing the text

The volume is interesting different from most books on obstetrics and is well worth a place on the book shelves of those interested in obstetrics W 5 5

RECENT ADVANCES IN MEDICINE Climical Inhoratory Therapeutic By G I BENLMONT M \ D M and I C Dobbs M VO M D Fifth Edition Octavo of 442 pages illustrated Philadelphia P Blakiston's Son & Company \$350

This volume the fifth edition in five years is a complete and comprehensive presentation of clinical laboratory procedures and therapeutics described and explained

in a clear, concise and accurate manner

In detail the authors have reviewed the useful tests for reral function and briefly the treatment of the different conditions. Glycosuria and diabetes mellitus with diagnostic methods and treatment are thoroughly reviewed, as are also pancreatic and hepatic function and tests. Conditions of gastric pathology with the newer tests and treatments are described in detail. Cardiac pulmonary and neurological conditions are discussed.

A chapter is devoted to cutaneous protein tests and desensitization and one is given to the determination of the susceptibility to diplitheria with immunization and the treatment of carriers. Blood clientistry, methods of the determination of the blood composition and special blood examinations are given also

This small compact volume of 400 pages contains a wealth of valuable information and will well repay a careful study. H M Mosts

The Bacteriofinage and Its Clinical Applications By F d'Herelli. Trunslated by George H Smith 12mo of 254 prices Springfield III Charles C Fhomas 1930 Cloth \$400

d Herelle's new book on the bacteriophage is a de highfully written summary of his work published previously in a number of papers. It is written not for the bacteriologist or immunologist but for the medical profession at large of Herelle succeeds in giving us a visid picture of the discoveries in this field as well as an amazing outloof is to the p solidities which are queue up by his investigations. The crystallities are sylvist and so overwhelming that scepties in seems to be the most natural reaction. If d Herelle's theory is true then our whole conception of infectious diseases and epidemies has got to change. This theory explains most effectively all the peculiar phenomena which have puzzled epidemiologists, such is the spin time is subsidiar, of epidemics or the changes in the severity of the dicale in the course of in epidemie. This there if true

would enable us to cradicate some of the most dreaded confugious diseases such as assistic choler plague diseasery and typhoid fever. It opens up possibilities in combating almost every other land of bacterial in fection.

d Herelle himself quotes the rulure of numerous other prominent investigators to verify his basic observations principally those which should prove that the lacterightage is a living organism. According to defertle the bacteriophage is a filterable virus. Yet there are but few bacteriologists at present who have in his years of Herelle explains their tailure to erroborate his findings by their faulty technique and points out the fact that no positive results can be of trained unless his in struction as to procedure and technique are strictly observed. It remains to be seen if nature work following exactly different footsteps will really prove the entitions upon which of Herelle has erected the imposing edifice of his bacteriophage theory. In spite of the most seeptical attitude however nobody can read his book without feeling stimulated by the originality and fasciniting personality of the author

M A GOLDZIFHER

PROCEDUPE IN EXAMINATION OF THE LUNGS BY ARTHUR E KRAETTER M D. Octavo of 125 pages. New York Oxford University Press 1930. Cloth \$200. (Oxford Medical Publications)

Here is a book that we recommend with great satisfaction and enjoyment. Thou, h dealing with a rather dill and dry subject. Dr. kractzer has approached his task with somewhat of a Will Rogers technique which in no way distracting from the value of his teaching renders it more human and readable. Especially would we recommend this book to all students of medicine

FOSTER MURRAY

INSOMNIA HOW TO COMBAT IT By JOSEPH COLLINS M D 12mo of 130 pages New York and London D Appleton & Company 1930 Cloth, \$150

Dr Collins asks the question—how much sleep do we need?—and then goes on to show through references from famous persons how the requirements for a refreshing sleep in different in different persons. Proper sleep means a complete relaxation of mind and body, whether it requires 4 hours or 8 hours. He maintains that "comfortable fatigue promotes sleep excessive fatigue promotes sleep excessive fatigues of sleeplessness are in deed numerous and would alone require many pages for their consideration and yet such common curses as tea and coffee, may not produce insomma in many persons

### OUR NEIGHBORS

### CLASSIFIED LISTING OF PHYSICIANS IN THE TELEPHONE DIRECTORY OF DALLAS, TEXAS

The Texas State Journal of Medicine for September describes the following plan for the classified listing of physicians of Dallas, Texas:

"Dr. O. M. Marchman, reporting for the Committee on Classified Listing in the Telephone Directory, stated that the telephone company officials had agreed to use the form of listing recommended by the American Medical Association. Each member of the society would be privileged to place his name in only one classification, that in which he limits his practice. No member would be allowed to use bold face or black face type, all names being listed in plain uniform type. The com-

pany officials had agreed to place under the names of members, the following phrase, 'Member of the Dallas County Medical Society.' The telephone company had further agreed to eliminate card advertisements of those who are not members of the county medical society. For the especial listing as stated, there would be a charge of seventy-five cents a month, in addition to a charge of forty cents per month for the phrase 'Member of the Dallas County Medical Society,' making a total monthly charge of \$1.15 per member. The report of the committee was adopted, and the committee authorized to arrange the listing accordingly."

### LEGISLATIVE TACTICS IN TEXAS

The September issue of the Texas State Journal of Medicine has an editorial describing the tactics of the opponents of medical standards for practitioners of medicine. It would seem that the tactics described in the following abstract would be impossible or unnecessary in New York State:

"The results of the election, by which we mean the run-off primary of the Democratic party are, on the whole, quite satisfactory, from the viewpoint of the public health. We have not been able to make a thorough check, because of the limited time and the ramifications of the situation. Suffice it to say that quite a few of the candidates for the legislature who were professedly contrary to the claims of the medical profession for public health and medical legislation, have been defeated. It would seem that the net results are rather distinctly in our favor.

"We have not yet heard from a number of our counties. We would urge upon our members that they determine the attitude of their respective and prospective legislators towards public health legislation, and let us have the information. To be forewarned and informed in advance is to be forearmed.

"We are not in a position to discuss here the efforts made by the cultists and quacks' to secure representation in the legislature. It was clear, however, that the firing was quite brisk from their sector, and there was evidence of definite organization. Here and there it would appear that they won skirmishes of limited scope but, as we have already said, on the greater part of the field of battle they lost.

"As familiar as we have been with the tactics of this group, we were rather amazed at the unsupported claims the friends of pseudoscientific medicine made during the campaign. We have referred to this matter before, and while we do not care to consume valuable space in discussing these claims, at least one instance will be amusing. A candidate for a seat in the legislature made the following statement over the radio: 'The doctors in this section have been influenced by a man by the name of Holman Taylor (the secretary of the State Association and editor of the Journal) who lives at Fort Worth, and who collects fifteen dollars apiece from six thousand doctors in this state, making a total of \$90,000. Dr. Taylor has a paid lobbyist that stays in Austin all the time, to whom he gives \$10,000 a year. Just because I would not vote like this lobbyist or Dr. Taylor wanted me to, he has created a stir among the doctors in this section, who have spoken some unkind and untrue things about me.'

"Of course, this candidate knew that Dr. Taylor did not receive \$90,000 a year from the

# SQUIBB'S NEW GERMICIDE DI-PHFN

### ODORLESS NON-POISONOUS POWERFUL

An explanation to the medical profession of this recently perfected germicide and what it offers the physician

A good many years ago, seeing the need for a non-poisonous germicide, our medical and chemical staff instituted

thorough laboratory research.

At that time horsh, tissue destroying liquids were in abundance. There were no strong but safe antiseptics. Much has been done to elim-

inate them but the need today is still great.

In Di-Phen we have perfected, we believe, the germicide for which physicians and hospitals have

IMPORTANT FACTS
ABOUT DI-PHEN
1 Phroal coefficient of 3.0

- 2 Non pulsonous even when swal lowed
- 3 No disagreeable informof phenol or cresol
- Does not stain or injute fabrics
   of instruments

long been waiting. We are very pleased with the results obtained with it in standard tests.

These tests consistently show that Di-Phen has a phenol coefficient of 3.0 or better. Yet it is absolutely non-poisonous even when swallowed.

It does not leave the characteristic disagreeable odors of phenol or cresol. Its own odor is slight and pleasing and vanishes with use.

We recommend Di-Phen for your inspection and use. We would be very pleased to receive any comments that you may care to make.

## "Upon the Advice of My Physician"

THE majority of men and women who come to McGovern's Gymnasium to correct some physical condition are sent there directly by their physicians.

For more and more physicians are realizing the futility of leaving patients to their own resources when exercises are prescribed, and have learned that through individual attention at McGovern's, their instructions will be faithfully carried out.

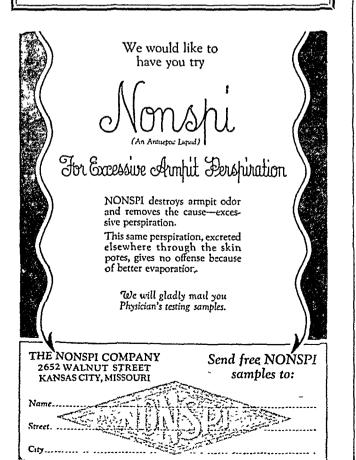

A work-out will convince you of the superiority of the McGovern Method. Let us send you a guest card. No obligations, of course.

Gymnasium (

(for men and women)

41 East 42nd St., at Madison Ave. New York City

(Continued from page 1258)

doctors of Texas, and that the alleged lobbyist did not receive \$10,000 per year. At least, he could have known it, and should have known it, as the money handled by Dr. Taylor each year is accounted for, to the penny, in the June Journal, and the salary of the 'lobbyist' in question is published to the world. We wish there were six thousand doctors in Texas and that they would each contribute fifteen dollars per year, not to Dr. Taylor, but to the State Medical Association, and we are sure that our Director of Public Relations. Mr. Reese, would be glad to have his salary raised to ten thousand dollars a year. But none of that is necessary, and it is not necessary to comment, except to show the extent to which the opposition will go in its deceitful claims.

"And, of course, our friend Dr. Ralph W. Still, the 'Christian Science Committee on Publication for Texas,' had to break into the press in defense of Christian science, which was not at all under fire. Mr. Still harped on the usual contention that the medical practice act of Texas makes the practice of Christian science the practice of medicine purely and simply because a charge is made for the service. He knows as well as any one may know who will give the matter a moment's unbiased thought, that such is not the case. The medical practice act very charitably excludes from its provisions healing by prayer as a part of an established religion, including this practice within the scope of the law only when representatives of the religions resorting to this practice enter the field of healing as a vocation. Quite aside and apart from all scientific issues involved, it would seem fair that all of those who practice the same vocation should come up to the same requirements. There is a difference between practicing a religion and practicing a profession.

"Mr. Still as usual, referred to the legislation exempting his cult heretofore enacted in many of the other states of the Union. He did not explain the character of the majority of these exemptions. He also made the usual allegation that the present medical practice act is sectarian in character and sets up a standard which is unjust and unfair to the other schools of medicine. He failed to say that the medical practice act does not require an examination on any method of practice whatsoever, only on the fundamental, scientific facts involved in practice. Neither did he say that no one school of medicine can have a majority mem-

bership on the present board of medical examiners, and that, as a matter of fact, there are at the present time four distinct schools of medicine represented on the board, one of

them non-medical. But what's the use!'

### INCOMES OF PHYSICIANS IN WISCONSIN

The August number of the Il isconsin Medical Journal prints a letter from Dr S D Beebe of Sparta, Wisconsin, reporting the meomes of physicians of seven counties of the Seventh Councilor District of which he is President He says that he obtained the figures from the meome tax department and that they therefore represent net incomes. Dr. Beebe writes as follows:

"Two years ago, while discussing a question of medical economics, one of the Past-Presidents of our State Medical Society asked me this pertinent question: 'Where is the country practitioner who is not taking in \$750.00 a month or probably two or three times that amount?' That question was asked in good faith and my answer to it, which I herewith submit, is in equally good faith.

"As Councilor for this Seventh District I have recently completed a survey with relation to the annual net income of all the physicians resident and practicing in this district at the date of the last income tax report.

"Average net income of physicians of

"Average net income of physicians of	
Vernon County	\$2,980
Buffalo County	2,892
Jackson County	3,660
Trempealeau County	3,717
Juneau County	4,238
Monroe County	6.086
La Crosse County	8,625
Average net income for the district	4,899
Number of physicians in district	116
Number of physicians with income over	13
\$10,000	
Average income of these 13	20,280
Number of physicians with net incomes	
of less than \$10,000	103
Average net income of these 103	4,379
Thirty-one physicians of the 116 in the	
district report a net income of less than	3.000
Forty-four have an income of less than	3.500

"Time and space will not permit a comprehensive discussion of these figures and their vital implications. I believe, however, the brethren would be fully as interested in them as in the labored discussion of 'The canary-yellow lipochrome discoloration of the naso-labial folds.'

"An open-minded study of the figures I have presented will convince almost anyone that those physiciaus, who are able to make vital hospital contacts, usually have a fair income. The rest, or most of the rest, are just out of luck, that's all."

### In the Nose Throat and Bronchial Season

### As Part of Your Basic Treatment

Olajen is neither expectorant, sedative nor symptomatic palliative.

Its effect is systemic, restorative, raising resistance.

Quite decidedly in Bronchitis, Laryngeal and Tonsillar affections and "Grippe" cases, it shortens the period of recovery, makes the patient feel "more comfortable," appears often to lessen the severity of the acute period,

and is useful

as a prophylactic, tending to prevent severer sequelae.

## Announcement DIGITALIS—

### A More Accurate Method of Standardization

For the physician's protection, as well as for that of the manufacturer, there is need of a more accurate method of standardizing digitalis.

For over 10 years we have used the cat unit method, regarding a cat unit as the weight of digitalis required to kill one kg. of cat, as determined by our pharmacologist. But we found that different pharmacologists obtained widely different cat units for the same sample of digitalis. For example:

### International Standard Digitalis Powder

Pharmacologist	Cat unit in Mgm.	
Α .	104.2	
${f B}$	89.7 <sup>*</sup>	
С	83.6	
C (By different		
technique)	90.5	
D	77.8	

From the above it is obvious that the absolute cat unit is a variable guide, but if each investigator were to ascertain by parallel tests how much of the standard digitalis powder and of a given sample of digitalis was required to kill 1 kg. of cat, then he could calculate the amount of the sample that was equivalent to 100 mgm. (one Int. Unit) of the standard.

In this way the relative strength of the sample of digitalis is found in terms of the Int. Unit, thus reducing the results of all investigators to a relative basis and eliminating most of the errors due to differences in technique, etc.

For your protection, therefore, we are adopting this more accurate method of standardization, which will apply to all products (Tincture, Tablets and Capsules) of Digitalis (Upsher Smith). For full information write for copy of the new Upsher Smith Booklet—"New Thoughts on Digitalis."

### UPSHER SMITH CO.

Sexton Building

Minneapolis, Minn.

### TAXES OF PHYSICIANS IN DENVER

The September issue of Colorado Medicine prints a letter from Clem W. Collins, Manager of Revenue of the City of Denver. Mr. Collins had criticized physicians as "not paying an equitable tax if the basis be ability to pay." The Committee on Public Policy asked Mr. Collins for proof of his assertion and in reply he submitted the following statement:

The classified telephone directory lists 498 doctors under the title "Physicians & Surgeons" in Denver. In analyzing their schedules I find that they have returned tax schedules showing the following ownership of properties:

Money, Notes and Credits

3 doctors—Average \$8,000 . . . \$24,000 10 doctors—Average 1,832 . . . 18,320 180 doctors—Average 235 . . . 42,370 305 doctors None

Total ...498 doctors—Average \$ 170 ...\$84,690

The above shows that according to the returns of the doctors, all of the doctors in Denver have in money, taxable investments and book accounts, only \$84,690, and 305 have nothing at all.

### Libraries

115 doctors—Average \$66.00 . . . \$7,610 383 doctors None

Total . . 498 doctors—Average \$15.00 . . . \$7,610

I will leave it to you to say whether or not you think the doctors are overassessed on their libraries and whether or not you think they are returning full value for their books. Perhaps after you have given this some thought you will be willing to say that your statement that we are overassessing the doctors on their libraries, may be subject to amendment.

### Machinery, Instruments and Equipment

1 doctor	• • • • • • • • • •	\$ 5,580
10 doctors—Average		
299 doctors—Average		
188 doctors		None

Total . . 498 doctors—Average \$ 155 . . . \$77,180

#### Furniture and Fixtures

327	doctors-Average	\$96,00	\$31,380
	doctors	•	None

Total . . 498 doctors—Average \$63,00 . . . \$31,380 (Continued on page 1263—adv. xiii)

(Continued from page 1262-ado vu)

I would suggest that you inventory the furniture and fixtures of a few of the doctors and see whether you think they should be assessed for less than the figures given.

#### Total Assessment

4 doctors-Average	\$8,260 \$33,040
32 doctors-Average	1,719 55,010
291 doctors-Average	388 112,810
171 doctors	None

Total ..498 doctors-Average \$ 403 ..\$200,860

When we consider the income of the gentlemen engaged in this profession we are forced to the conclusion that a tax of less than \$6,500 from all of them is hardly commensurate with the tax that a merchant, manufacturer or real estate owner pays.

Again I wish to repeat that this is not intended for an attack upon the doctors, for as stated before, the same thing is true of all professions. Neither do I place the blame on our professions, it is the fault of our system of taxation, and I repeat that if our theory of taxation is that the citizens should pay in proportion to their ability to pay, that the professions are not paying in proportion to others.

### PREVENTIVE MEDICINE IN WISCONSIN

The Wisconsin Medical Journal of August contains a "President's Page" in which Dr. F. J. Gaenslen, of Milwaukee, discusses the practice

of preventive medicine, as follows:

"A pediatrician, or for that matter a general practitioner, should feel some pangs of conscience, if patients regularly under his care contract readily preventable diseases, unless preventive measures suggested by him have been declined. Our code of ethics, very properly a rigid one, is responsible for a sensitiveness which is not compatible with too great insistence upon the selling of our wares. The physician, however, can certainly not be held responsible for that large group which can claim no regular medical adviser, nor for the floaters who go from one to another. For these groups there is nothing to do except to continue the general educational program now in operation in the hope that persistent efforts will eventually hear fruit.

"If, however, the individual physician is largely exonerated, the same can not be said with equal truth of the profession as a whole. The public is probably justified in looking to the medical fraternity for guidance and protection in matters pertaining to health and we should be willing to

recognize and assume a certain responsibility, cooperating and supporting the health departments in their educational programs. If, for instance, we feel as a body that compulsory vaccination against smallpox, or perhaps more effective regulations are desirable, let us say so. We could in many ways strengthen the hand of the health departments, clearing away hindrances to efficient work and laying new plans for expansion of preventive measures. It is probably safe to state that this is one of the major problems of organized medicine today. It would seem incumbent upon the individual practitioner to develop a greater consciousness of responsibility toward his regular clientele, and on the other hand upon the profession as a whole to taking more active part in public health matters. Consideration of local public health records might well be part of the regular routine of every county society in the state, with the idea of stimulating efforts to assist departments of health in reducing incidence of disease and preventing economic loss. After all we are part of the public and as likely to profit by proper health standards as our neighbors.'

### INDEMNITY INSURANCE IN NEW JERSEY

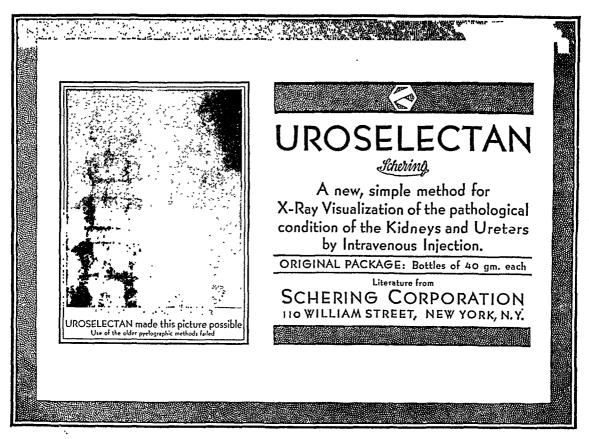

The annual report of the committee on Medical Defense, printed in the Supplement of the Journal of the Medical Society of New Jersey, discusses indemnity insurance as follows:

"During the past year, 1420 members were insured under the Policy of the United States Fidelity and Guaranty Co., approved by the Medical Society of New Jersey. The number insured the previous year was approximately 1100. The increase was nearly 30%.

"In the last 6 months, 20-30 members per month took out policies. Mr. Heard, of Faulhaber and Heard, has been personally visiting the doctors not on the list of insured under the society's policy.

"The present cost of insurance to members of the New Jersey State Medical Society, on account of its good experience, is at a very low rate. The cost in two other eastern states, designated as N and M, compare with New Jersey as follows:

(Continued on page 1265-adv. xv)

Please mention the JOURNAL when writing to advertisers

Cost of X-Ray and Radium Policies
\$10,000 30,000 \$25,000 75,000 \$50,000-100,000
N \$135.63 \$201.47 \$231.68
M 75,00 135.00 150.00
N.L 70,00 85.00 110.00

Our present insurance rates compared with those of 2 other companies are:

\$10,000 30,000 \$20,000 60,000 \$50,000 100,000 A \$25.00 B 21.00 \$37.00 U.S.F.&G. 16,000 23,50 \$35.00

"The U. S. F. & G. extends to doctors the privilege of further reduction in cost of the policy: 'If protection is taken for 3 years, a discount of 10 per cent of the full 3-year premium is allowed, payable 50 per cent the first year, 30 per cent the second year and 20 per cent the third year.' Under this plan the average yearly cost for a \$10,000-30,000 policy is \$14.40. If the full 3-year premium is made in

one payment a further discount of 5 per cent i allowed, and the average annual cost reduced from \$14.40 to \$13.60 This average cost compared to policies of  $\Lambda$  and B companies is 45 per cent and 34 per cent respectively

"Of 1420 members insured, only 38 are covered for X-Ray and Radium, 22 for X Ray. 8 for Radium and 8 as Dermatologists. The approximate revenue from this specialists' group is: X-Ray, \$1865; Dermatologists, \$639. Radium, \$770—Total, \$3274. The last 5 years' statistics show that there were 950 claims in the X-Ray group with losses of \$225,000 and a loss ratio of 66 per cent, not including costs of litigation, agents' commissions, etc.

"During the past few years companies have ceased writing x-ray and radium contracts in 3 to 8 states, on account of sad experience. One company increased its rates in several states Sufficient data on x-ray and radium coverage have not been accumulated by the companies to enable them to fix definite rates. Our company has had a loss ratio of over 70 per cent. From the small amount received from x-ray users, less than \$2,000, one recent

## Reducing the risk in pregnancy

BRIGHT red lips, dry body surface, marked exhaustion and lowblood pressure, spell acidosis during labor.

It is easier to prevent it during pregnancy than to treat it during labor. A teaspoonful of Alka-Zane in a glass of water, or half milk and half water, is a safe, certain and reliable preventive of acidosis as a complication of pregnancy. It is easy to take, too.

Final decision on the true worth of Alka-Zane rests with the physician. We will gladly send a twin package, with literature, for trial,

Alka-Zane is a granular, effervescent salt of calcium, magnesium, sodium, and potassium carbonates, citrates and phosphates. Dose, one teaspoonful in a glass of cold water.

Alka-Zane

loss would take 5 years of premius to overtake that judgment alone.

"The committee has gone into details because protests have been made as to the exorbitant costs of x-ray and radium insurance. As a matter of fact, the contrary is true. A special committee reviews every application for x-ray and radium proection, and unless approved by that committee the company does not issue a contract. Thus, incompetent men are discouraged from doing this line of work and standards are kept up, the public protected and more work given to those who deserve If x-ray and radium should be included in a blanket policy, the initial cost would be increased to every insuring member, and very soon thereafter a larger number of suits would bring further burdensome increases for contracts."

#### THE PURPLE CROSS

It is probable that the order of the Purple Cross, composed of undertakers, is not well known among the physicians of New York State. The editors of Minnesota Medicine, in the September issue, call attention to the order in Minnesota, and also to the need of better cooperation between physicians and undertakers. New York doctors do better than their Minnesota confrères, if the following editorial is correct:

"It may or may not be appropriate that entrance to this world should be certified by the physician and exodus by the undertaker. It is not generally known, however, that according to the law of this State the undertaker is required to furnish a death certificate filled out and signed by the last physician in attendance, before a burial permit is allowed. This law went into effect several years ago and there might be room for argument whether the entire responsibility for certification should in justice be placed on the undertaker. The law being as it is, there is every reason why the physician should cooperate in every way in filling out his part of the certificate. We are informed that 95 per cent of physicians promptly do their part. There are, of course, exceptions. One physician, we are informed, refused to be bothered because it was This necessitated a second trip on the part of the undertaker, and, of course, caused inconvenience and hard feeling. It is almost inconceivable that any physician should have taken such an attitude.

"The Purple Cross is the insignia adopted at the time of the World War by the funeral directors of the country, more commonly known as Various localities, including Minundertakers. neapolis and Saint Paul, have a Purple Cross

(Continued from page 1266-adr xv1)

Club composed of the local tuneral directors. "The attention of officials of the State Medical Association has been called to this joint obligation of undertaker and physician, with the idea that better understanding will result. Both professions serve the public and it is in the interests of better service that attention is called to the need for 100 per cent cooperation."

### ECONOMIC QUESTIONNAIRE IN WEST VIRGINIA

Dr. Walter E. Vest, in the President's Page of the West Virginia Medical Journal for October, calls attention to a questionnaire on economics as follows:—

"There is now being mailed to each member of the State Association a questionnaire calling for certain information which, when assembled and correlated, will be of inestimable value to the profession of West Virginia and, for that matter, to the general medical profession. Inventories are an absolute necessity in business, and an inventory of a great profession must prove of marked benefit to the individual members of that profession. What are we doing? Are we adequately paid for our work? How much charity service do we contribute to the welfare of the state? These questions can be answerd, and answered accurately, if each member will return his questionnaire properly filled in. Every precaution has been taken to preserve as private and confidential the information furnished, so that even Mr. Savage will be unable to tell who gives the statistics on any individual sheet.

"So far as your president knows, this effort to evaluate the profession of our state is an innovation in medical economics. The information gleaned can not fail to be worth while to us as individuals, of great benefit to the State Association as an organized body, and of inestimable value to our legislative committee in planning and securing the enactment of

future legislation."

The Journal also says editorially:-

"The questionnaire will relate to the practice of medicine in this state and will seek to find out, among other things, the gross and net income, the amount of charity work, the type of practice, and the percentage of collections of every member in the state. In order to assure every member that the information will be strictly confidential and secret, the usual signature line has been purposely left off the questionnaire and it will not be necessary to sign the questionnaire when it is returned to this office. In other words, it will be sent out and returned as a 'secret ballot."

### STUDENT EDUCATIONAL FUND IN GEORGIA

The June issue of the Journal of the Medical Association of Georgia records the proceedings of the Sixth Annual meeting of the Executive Board of the Woman's Auxiliary held May 13, which contains the following item:

"The report of the Committee of the Student Educational Fund was called for and Mrs. Bunce read the following:

- 1. This fund shall be called "The Student Educational Fund."
- 2. The purpose of this fund shall be for the medical education of worthy Georgia boys and girls sufficiently educated to enter medical college.
- 3. The money is to be loaned at a yearly rate of 4 per cent interest and the amount of the loan shall not exceed what the Deans of our Medical Schools think necessary—that means, of course, the Dean of the Medical School of Emory University and the Dean of the Medical School of the University of Georgia.
- 4. Supplement, rather than give the entire fund for the year. This is to continue for a period of at least five years.
- 5. Encourage graduates to stay in Georgia, but do not compel them to do so if by this act we handicap them in their advancement.
- 6. Money may be obtained from donations outside the Auxiliaries to the medical profession. The County Auxiliaries shall pay a minimum of \$1.00 per capita. It is desired that larger Auxiliaries give \$2.00 per capita. This money given by the County Auxiliaries may be raised by their organized efforts in any way they desire.
- 7. The funds shall be administered by a standing committee with chairman elected by general body to serve three years. There shall be a representative from each District Auxiliary, a Treasurer; the President and President-Elect of the State Auxiliary shall be exofficio members of this committee.
- 8. Transactions shall be kept and read to the general assembly at its general meeting.
- 9. Selection of students to be left to the committee subject to approval of the general body.

The Assembly elected Mrs. William Shear-house, Savannah, as Chairman of the Student Educational Fund of the Auxiliary."

#### MEDICAL LOSSES FROM AUTOMOBILE ACCIDENTS

The losses which doctors and hospitals sustain through automobile accidents are appalling and are discussed editorially in the September issue of the Ohio State Medical Journal as follows:

"The increasing toll of automobile accidents in the country annually has created a new and puzzling problem for physicians and hospitals to struggle with.

"A large percentage of the bad accounts found on the books of doctors and hospitals—and they total millions of dollars—are those of victims of automobile accidents who have refused to pay or are unable to compensate for services rendered.

"Economists have estimated that the cost of hospital care alone for highway accident cases in the United States during 1928 amounted to between fifteen and sixteen million dollars, and that the financial loss sustained by the institutions was between six and seven million dollars. Accident victims who are unable to pay or do not pay for services are carried on the hospital's books as 'charity' patients, making an enormous drain on the resources of the institutions and creating a deficit which must be borne at least in part by pay patients.

"Due to the situation, the Department of Institutions and Agencies in the state of New Jersey, has been conducting a survey of the problem and some of the information uncovered is enlightening.

"Nineteen general hospitals in New Jersey, studied in detail, show that they treated 1781 highway accident patients who spent 22,440 days in the hospital during 1928. The hospital bills rendered to these patients totaled \$106,089, but of this amount only \$59,150, or 56 per cent was collected. A majority of the hospitals studied do not expect to recover even a small portion

POLAND SPRING COMPANY

> Dept. C 680 Fifth Avenue New York City

of the \$16,850 unpaid. The survey indicates that the total cost of hospital care of highway cases in New Jersey was somewhere between \$600,000 and \$650,000 last year, and that the financial loss to the hospitals amounted to between \$250,000 and \$300,000.

"This study does not include physicians who treated the thousands of traffic accident victims, but it is safe to assume that almost every dollar lost by hospitals could be matched by a similar uncollected amount due attending physicians.

"What is true in New Jersey, is undoubtedly true in Ohio, and because of the larger number of automobiles in this state, the annual losses necessarily must be greater.

"Some states have attempted to meet the situation by giving the hospital the right of lien. The benefits derived from this plan are at the present time obscure.

"Some form of protection for physicians and hospitals is long overdue. The question is one which deserves the careful study of authorities and agencies interested in traffic, transportation, safety and insurance problems, as well as members of the medical profession and hospital officials."

English doctors too are imposed upon as shown by the following quotation from the A. M. A. Journal:

"My appliances, my splints, my bandages are taken without payment and are never returned. In the great majority of cases I can recover nothing. Three times while engaged in bandaging the injured in the midst of the crowd, which is apt to collect on such ocasions, I have had my pocket picked. Repeatedly I have had small articles taken from my car. And I find that my experience is identical with that of many of my fellow physicians"

### STUDY OF LENIGALLOL (TRIACETYLPYROGALLOL) IN DERMATOLGY

Engelhart and Welcker, Univ. of Giessen, in the Derm. Wchnschr. 2, 1930

report the beneficial effect of Lenigallol in the treatment of moist, subacute and chronic localized eczemas. It was applied in 1 to 10 per cent strengths in zinc oxide ointment. A typical prescription used is as follows:

Rx Lenigallol gr. xlv Olive Oil gr. xx Zinc Oxide aa 3 iss Starch ad 3 i Petrolatum alb.

The ointment is applied several times a day for 3 or 4 days. Crusts should be carefully removed. After the Lenigallol course the areas are cleansed with olive oil, no water should be used. At times the treatment is then concluded with ichthyol (2 to 10%), Wilkinson's ointment, or tar, though the last named is not to be used if it produces irrita-tion and inflammation.

Microscopic examination of the tissues of the diseased areas showed that after 24 hours the hyperemia and exudations were reduced and that the formation of a new thin layer of malphigian cells which rapidly increased in number had taken place. At the end of the third day the outermost layer was of normal horny type. The improvement observed microscopically was plainly visible to the naked eye .-See page vii-Adv.

### BARNUM-VAN ORDEN

Supporting Corsets and Belts

Specific support, well balanced to give correct uplift to abdominal walls. No elastic to stretch and destroy balance of support. Made in both laced front and solid front designs but adjusted from the back with the upward backward traction necessary for correct uplifting support.

### Rheumatic Diseases

Arthritis, Sciatica, Lumbago, Neuritis, and Gout Treated Exclusively.

Painstaking diagnosis and therapy as indicated; complete clinical laboratory and department of physiotherapy.

HANNON LODGE is centrally located and fully equipped. Only rheumatic patients accepted. All treatments under careful and constant medical supervision. Reports available to referring physicians, who may at all times retain contact with patients. A completely equipped pathologic laboratory supplements diagnoses and treatments. Specially trained staff. Limited accommodations are carefully restricted. Reservations necessary in advance. Inspection cordially invited.

120 acres of woodland privacy; 800-ft. elevation with 20-mile view. 42 miles from New York. Tastefully furnished and beautifully landscaped. Accommodations to meet the requirements of patients, single rooms or suites.

and cure rickets.

\*Mead's Viosterol in Oil is now designated 250 D, because in deference to Dr. Harry Steenbock—and in the interest of uniform nomenclature—we are now assaying our product by his method. Before October 1, 1930, this same product was assayed by the McCollum-Shipley method and was designated 100 D. Mead's Viosterol in Oil, 250 D (Steenbock method) - in normal dosage-is clinically demonstrated to be potent enough to prevent and cure rickets in almost every case. Like other specifics for other diseases, larger dosage may be required for extreme cases. It is safe to say-based upon extensive clinical research by authoritative investigators (reprints on request)—that when used in the indicated dosage, Mead's Viosterol in Oil, 250 D is a specific in almost all cases of human rickets, regardless

## Dewey'S DEW-TONE and PORT

HAVE you not wished at times, in patients with chlorosis, or mild anemia of senility, or in patients without any definite disease except the syndrome of lassitude, weakness, anorexia, and general lack of vaso-motor and neuro-muscular tone, that you might be able in a short time, under your care, to restore them to normal health and a feeling of well being?

We feel that Dewey's "Dew-Tone and Port", a combination of old Port, glycerophosphates and peptone, will accomplish just that and we would like you to try it.

On how many occasions each year, do you write a prescription for "I Q & S" or some similar tonic, knowing at the time that the inorganic iron content is of such complex molecular structure, that the assimilation is only an extremely small percentage of each dose; so small, in fact, as to be almost negligible? "Dew-tone and Port" contains properly matured Port made from grapes known to produce Wine of the maximum iron content and in this form is most easily assimilated.

Dew-tone and Port is only sold direct to you or your patients

## LIQUID PEPTONOIDS WITH CREOSOTE

Combines the active and known therapeutic qualities of creosote and guaiacol with the nutritive properties of Liquid Peptonoids and is accordingly a thoroughly dependable product of definite quantities and recognized qualities as shown by the formula:

Each tablespoonful represer	its	1 ) ,
ALCOHOL (By Volume)		12%
Pure Beechwood Creosote '		2 min.
GUATAGOL		1 min
PROTEINS (Peptones and Propeptones)		5.25%
LACTOSE AND DEXTROSE	٠ '٠	11.3%
CANE SUGAR		2.5%
MINERAL CONSTITUENTS (Ash) 1.		0.95%

It acts as a bronchial sedative and expectorant, exhibiting a peculiar ability to relieve bronchitis—acute or chronic. It checks as well a persistent winter cough and without arsh or untoward effect. It is agreeable to the palate and acceptable to the stomach—with merit as an intestinal antiseptic. Supplied in 12 oz. bottles.

## Quick Relief

## in HYPERACIDITY

One of the symptoms most frequently noticed by the physician in everyday practice is that of hyperacidity, because it is so closely identified with common causes of disease ... over-eating, sedentary habits, unbalanced diets, bolting of food, gastro-intestinal disorders.

When the well known symptoms of hyperacidity are recognized by "sour stomach," acid regurgitations, burning pains after eating, the balanced antacid BiSoDol is of great value in affording Quick Relief.

Being a balanced formula, BiSoDol has many advantages over single alkalis.

Let us send you literature and clinical sample of this ethically presented prescription product.

### THE REHABILITATION MOVEMENT OF THE HARD OF HEARING

By WENDELL C. PHILLIPS, M.D., NEW YORK, N. Y.

An address which was given before the Eleventh Annual Convention of the American Federation of Organizations for the Hard of Hearing, in New York, June 1, 1930, and which is published also in the October issue of the Anditory Outlook, the official organ of the 1 electrion

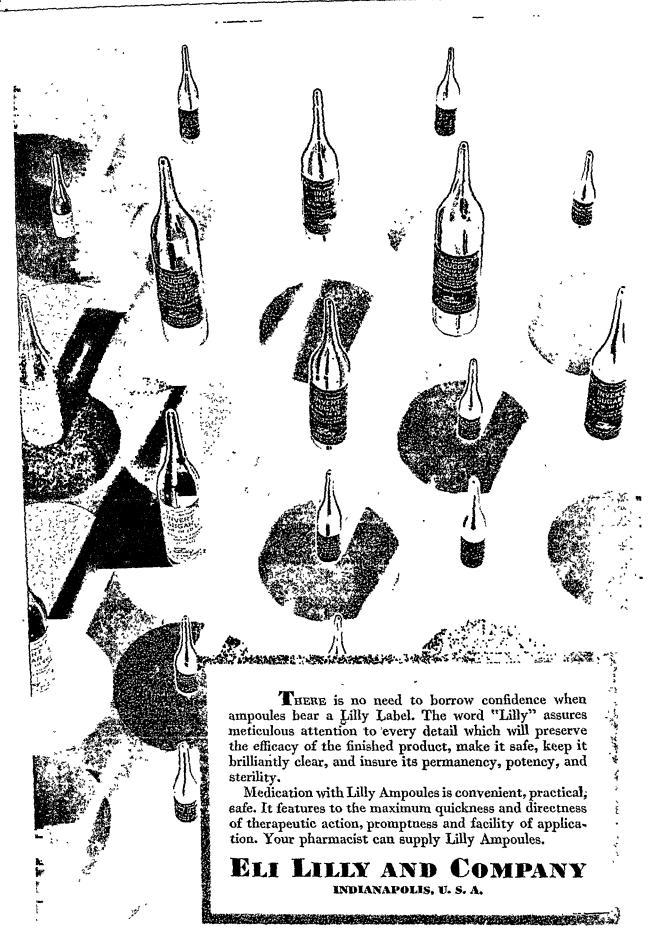

HE world movement for the amelioration of the handicaps inherent to impairment of the hearing function will, in 1930, celebrate its twentieth anniversary. The originators of this movement were acutely aware of the problems involved, for their own lives were beset with them as well as the lives of those who came to them seeking help. The tired old world had plenty of time-countless milleniums, in fact, to study and solve these same problems, but had passed them by. The sum of needless human suffering which inevitably followed the gradual failure of the sense of hearing was appalling; the frustration of efficient human energy, the agony of enforced isolation and inactivity, were tragic. But these conditions went further than the individual's right to live, to earn, to be happy, they struck at the heart of things-the State. Needless human waste is waste of citizenship; well do we know what constitutes a State-men and women, living joyous lives of fulfilment and bringing up healthy and well instructed children to succeed them.

The Central Organization—During this twenty years we have surveyed our field, clarified our knowledge, chosen our boundaries. We have organized our own central body—the American Federation of Organizations for the Hard of Hearing, through which nearly one hundred organizations or units have been formed in the United States and Canada. In this field of endeavor, we, the creators enjoy the honors which the world always bestows upon pioneers. In the development of the Federation we have fortunately made a few mistakes. We have avoided entangling alliances. We acknowledge the cordial cooperation of the American otologists, their national societies and the American Medical Association, which have helped us to maintain high ethical standards.

Here, as in every other field of human endeavor words and their meaning count fact, it is vitally important in this movement that the correct terms be used. For, of the wrong word be used, the wrong image is set up in the mind, and confusion follows. Confusion means failure. Why? Because the public mind is already confused regarding deafness. Let us examine these words in the light of history. Let us once and forever differentiate. In a population of nearly one hundred and twenty millions in the United States alone, about fifty thousand inhabitants are living who have never known or experienced the full sense of the hearing function. These people are a recognized class by themselves. They were either born without hearing or lost it before the acquisition of speech. They face problems, both psychological and educational, peculiarly their own. Even if they finally acquire speech, it is never normal speech. These individuals require special education in special schools. These are the only people who should ever be designated as deaf.

Recognition of the Problem: The great army to which we belong, which numbers several millions of the inhabitants of the United States and Canada alone, should be classified as hard of hearing. We have once enjoyed the full benefits and accomplishments of the normal hearing function. We are physically normal persons, educated like normal persons, but whose hearing has become impaired to a greater or less degree. Hence, we constitute the group which must be termed hard of hearing.

It was a new thing in adult education to teach lip reading to those who had lost some of their hearing. There were a few schools in the larger cities where adult lip reading was taught. These schools brought together groups of hard of hearing people who were stimulated by the fact that

from personal experience. We are unique; we do our own good and do not have to have good done to us. Our hearing friends—and they are many —are our brothers. Amongst us leadership is a matter of knowledge and character, not of ears.

It follows then, if we hard of hearing people realize our obligation to work in our own great field, that we should put our own money into it as well as our love and full sense of justice. This movement is successful—it is here to stay. It is, therefore, the best of all possible investments for the philanthropic and generous, among the hard of hearing people of fortune, either in their lifetime or by bequest.

Let us now rehearse the articles of our faith and the principles upon which we stand. We who once enjoyed hearing and all its benefits, who are intellectually awake and sympathetically devoted to the welfare and progress of our own neglected group, contend that ours is the right to earn a living in fair competition; ours is the right to adult education; ours is the right to a share in the cultural riches of the world, to all the social justice, happiness and spiritual freedom which all human beings may rightfully command. field of service is in large measure the field of rehabilitation—that is, of helping the victim of a physical hearing impairment to surmount disablement and become, as nearly as possible, as good as before. This is not mere alleviation, it is the opening of a door to opportunity, for, when rehabilitated, the hard of hearing person quite frequently surpasses his previous unhandicapped achievement.

For ages upon ages the hard of hearing person has had no defense against exploitation, whether industrial, medical, quackery, or the faker of mechanical aids to hearing with their false promises to cure through deceptive advertising. He has now become aware that he must defend himself and that if he does so he will draw generous-minded hearing persons to his support as well as his own handicapped fellows. By uniting and through determined education of employers, their medical examiners, and also legislators, we can and must secure a square deal for the hard of hearing worker. Most of all should the hard of hearing unite against those who threaten the future efficiency and happiness of the hard of hearing child by the exploitation involved in miseducating him. The hearing child whose hearing is beginning to become impaired must and shall be kept where he belongs-in school with hearing children, aided and abetted by sufficient lip reading instruction, where his speech, his play, and above all, his psychology may remain normal. Any person who condones or in any way encourages by gift or moral support any effort to miseducate these children of their own group is guilty of a serious spiritual crime against defenceless childhood. Public education must accordingly be ceaseless, widespread, and uncompromising in accuracy. It must be explanatory; then constructive. Public opinion must be altered; and we all know this can be done and has been done again and again. We must explain, explain, explain, on the air, on the platform, in the press, in our private and in our professional or business lives, and our conviction must blaze with the fires of our faith until we have kindled the imagination and the righteousness of our fellow men. Full opportunity for the hard of hearing must be demanded until it is secured.

Methods of Rehabililation: Education opportunity for the child whose hearing is beginning to be impaired must not be lacking; he must have medical examination, treatment and then lip reading in his public school. He must have enlightened vocational guidance and full opportunity for vocational training. Higher education must be made possible for him and also adult education, in order that not only the well educated hard of hearing child may attain his full intellectual capacity, but also that he, and all who are now adults with impaired hearing may continually avail themselves of the wide opportunities now offered by the universities.

Full occupational opportunity must be made available to the hard of hearing, in order that the present waste of human ability through discrimination against the hard of hearing worker shall cease.

Full cultural opportunity may again become the refreshment and joy of the hard of hearing if they will demand that church authorities, managers of assembly and concert halls, and theatres install the hearing apparatus for audience rooms which the scientists have already developed. Cultural education, music, the drama, are within easy reach of the hard of hearing if they themselves will unite, in their millions, to procure mechanical hearing. With full opportunity as here outlined, the tragic waste of citizenship caused by the world's indifference and our own social lethargy, will cease forever, while our human resources will be enriched for all time beyond our power to reckon.

Prevention: This movement of the hard of hearing people which has grown to such proportions in the last ten years, may be said to be unified and solidified by one great vision, the control or prevention of those physical conditions which cause the sense of hearing to fail. A program has been developed which is being adopted in many cities. This program of early detection treatment and lip reading without any segregation of the child with incipient hearing impairment, has enlisted the combined labor of the progressive otologist, the educator, the social worker, the acoustician and the electrical engineer, besides thousands of socially conscious hard of hearing

adults. Working for future generations, the united laborers in this field entertain a reasonable hope that annihilation of hearing impairment may finally reward their efforts. They behold at present a field surveyed, analyzed, fenced and with a considerable area already planted. Workers and financial support cannot fail to respond in full measure to such an appeal, for the making of a harvest which shall serve the world.

Material Needs: Having declared the platform for our endeavor, let us now attempt to outline the material needs for erecting the superstructure. This superstructure will be ill formed unless in its makeup it blend the spiritual with the material, with emphasis upon the spiritual.

The devoted, consecrated, self-sacrificing personality of men and women has thus far been the guiding star of this movement, and so it must remain if we expect to reach our goal. But in this day and generation, as never before, most humantarian enterprises are doomed to failure unless linked up with material forces,

The American Federation of Organizations for the Hard of Hearing is made up of unit organizations. These unit organizations are vital, and are rapidly increasing in numbers and membership. In ten years nearly one hundred have come into existence. Another ten years at least four hundred more may be expected to join the ranks. These units serve as crusaders carrying our Federation gospel to the multitudes of the hard of hearing yet unawakened. Of the millions of hard of hearing in the United States and Canada probably not more than five per cent have ever heard our slogan of overcoming the handicap of hearing impairment through rehabilitation. They know still less regarding our crusade for the detection and prevention of hearing defects in children, or of our enlistment as privates in the army of otological research to the end that the normal hearing function of future generations may be fully preserved.

The Federation is about to establish a new department under the head or title of "field serv-

ice," with an efficient director in order to further stimulate the formation of new units.

Our crusade must have the stimulus and support of wider and more comprehensive publicity if we expect our message to rapidly invade the hard of hearing world. Our new magazine—The Auditory Outlook—and our new Federation Bulletin constitute a step in the right direction. But whenever funds become available the Federation should employ publicity measures adequate to our needs.

The medical, educational, and vocational needs of the child with impaired hearing have already been referred to, but it remains for us to induce every school and every university to change its curriculum so as to include vocational

advice and otological guidance.

Our superstructure should embody and should encourage and support every phase of clinical and laboratory research into the problems relating to the prevention of hearing impairment. In order to solve the problems of causation of the various types of hearing defects, science must achieve its victory through the gateway of research. This is essentially an otological, hence, a medical problem. It is, however, within our province to actively promote the clinical phases of research. Furthermore, the Federation should become an active agency in providing the much needed financing of a world-wide research program.

The Federation program constitutes a great humantarian enterprise. In order to be successful its affairs must be conducted along business lines—not for self-gain, but for the benefit of mankind. We have a righteous cause. We are conscious of our needs and we are well equipped with human efficiency, but up to this time we have only been reasonably financed from within our own ranks. But what of the future? All the phases of our work herein enumerated are capable and worthy of tremendous expansion, and we have about reached the point where the rapidity of such expansion will depend largely upon the abundance of our financial support.

## MIDDLE EAR INFECTION, COMMON FORMS AND THEIR MANAGEMENT\*

By JOSEPH POPPER, M.D., NEW YORK, N. Y.

IT is a well recognized fact that the diagnosis of middle ear disease depends primarily on the examination of the drum. Two things are essential to a proper examination of the drum; first, the external canal must be clean, which means that all discharge and cerumen must be removed. This is quite obvious,

\*Read before the Bronx County Medical Society, October 17,

and yet many a time have I seen a diagnosis ventured concerning middle ear disease where the drum could not be seen, hidden as it was by cerumen. Which brings me to the second point, viz., you must have proper tools to work with. These should consist of a well-lighted auriscope, specula of adequate size, a cotton applicator and a small curette, the last to be used carefully when you can-

not clean the ear with cotton. I should like to stress the matter of light. Normal drums often appear inflamed in the half light of a rundown battery. Also I think it important for those who treat infants to have an infant size speculum, otherwise a complete view of the drum is impossible.

Finally in approaching the examination it is well not to antagonize your patient by inserting your speculum abruptly. Pain in the ear is frequently caused by lesions in the canal, therefore approach the examination cautiously by looking at the entrance to the canal for any lesion and then carefully pull on the pinna to determine the presence of tenderness. This manner of approach is especially important to get the co-operation of a child in the examination. Indeed, if you've ever been a patient yourself with ear infection you will appreciate the terror with which the average patient approaches an examination.

For practical purposes middle ear infections are divided into acute and chronic. Taking up the acute infections first we further divide them into catarrhal and purulent. Now the dividing line between catarrh and suppuration is not always well defined and yet the distinction is an important one from the point of view of treatment. In a general way it may be said that all middle ear infections begin as catarrhal inflammations and in the course of more or less time either subside as such or progress into suppuration. The distinction, then, is determined by taking into account two things, first the duration of illness, and second, the appearance of the drum.

I, for one, am unable to state how long it takes for a catarrhal inflammation to change to suppuration. The factors that enter into the change are many, such, for example, as the type and virulence of the infecting organism, the patient's resistance and perhaps the time and manner of treatment. In determining the change, then, we must depend upon a combination of the time element and the appearance of the drum. Most authorities consider that middle ear the seat of catarrhal inflammation where the drum membrane is either dull or red with little or no bulging and with the landmarks plainly visible. On the other hand where the drum is bulging and the landmarks obliterated with redness more or less marked, the middle ear contains pus.

This being a practical paper, I shall not go into the merits or demerits of the classification just cited but will approach the subject from a different angle. Assuming that middle ears containing pus require drainage by myringotomy a practical division between catarrhal and suppurative inflammation of the middle ear may be stated by putting the ques-

tion, "When does an ear require myringotomy?"

Now in my experience the indications for myringotomy are as follows:

- (1) an inflamed drum plus severe pain which is not relieved by palliative measures.
  (2) an inflamed drum plus high fever not
- (2) an inflamed drum plus high fever no otherwise accounted for.
- (3) an inflamed drum plus marked mastoid tenderness. Mark you, I have not said anything about a bulging drum and advisedly so, because I believe it makes no difference whether the drum is simply red or bulging provided the other factors are present. However, as a matter of fact, in the vast majority of cases, bulging is present together with one or more of the indications mentioned. The point I would stress here is that given a drum that is red and even bulging, if it is unaccompanied by any of the factors above cited there is no indication for interference with the knife. If left alone these cases usually clear up or discharge spontaneously and get well in the usual length of time. Of course where the drum is bulging and thinned out having that pale pinkish color indicative of pus, myringotomy may be done to hasten matters.

When I was a medical student, I was taught to incise at the first sign of inflammation of the drum. That policy I now consider a pernicious practice because fraught with the danger of adding a severe infection to a mild one. If, then, we assume in a general way that myringotomy should be performed only for the release of pus we have a practical and, I believe, a serviceable guide to the distinction between acute catarrhal and acute purulent otitis media.

Perhaps the best way to take up the management of a patient with acute middle ear infection is to describe the course of a typical case. You are called to see a patient suffering from coryza. On examination you find the nose discharging and the throat congested with fever more or less high in inverse proportion to the age. At this stage, in a child, you examine the ears and find them normal. You prescribe the usual treatment for coryza, viz., rest in bed, a cathartic and salicylates or coal-tar products. The use of silver preparations for the nose I consider worse than useless. A weak solution of menthol in alboline for that purpose is less likely to irritate the delicate mucous membrane of the nose and at the same time offers some relief. The cautious physician will at this time warn his patient against blowing the nose. To prevent ear infection it is safer, altho not so elegant, to suck the nasal secretion into the pharynx and expectorate.

A day or two later you are called again

because the patient complains of pain in one or both ears or because the baby cried a good deal or was very restless. The other symptoms and signs are still present and this time examination of the ears reveals a drum or drums red and perhaps slightly swollen at The landmarks are not obthe periphery. literated. You now attempt to relieve your patient by ordering the instillation of warm phenol and glycerin with or without local applications of heat or hot boracic acid irrigations. I have found phenol and glycerin most effective when the external canals are filled up with it ever three hours, using a 3 to 5% solution for children or up to 10% for adults. At this time also, in adults, careful inflation thru the Eustachian catheter often hastens a

On examining your patient the following day, you find either improvement of all symptoms and signs or, conversely, the drums are red and bulging and all landmarks gone. Assuming the disease has progressed so far as the appearance of the drum is concerned you are now confronted with the question of myringotomy. Your decision should depend upon the presence or absence of the three factors above mentioned. Let us assume further that myringotomy is indicated. Now in connection with this operation there are a few points I should like to mention. First, it should be as painless a procedure as you can make it. I know of no more shocking injury to a normal human being than lancing a drum without anesthesia. Local or general anesthesia should be employed except in very young children; in them when properly performed it is almost painless. Second, the incision should be made thru the apex of the swelling and from below up. On account of the anatomical inclination of the drum, lancing in that direction assures a complete and satisfactory incision. Third, the best knife to use is a bayonet-shaped one; at least I find it best.

Now having incised the drum you should obtain a discharge of pus mixed with blood. You next leave instructions for the ear to be kept clean by gentle irrigation with saline solution or by wiping away with cotton. Phenol and glycerin is now discontinued except where pain continues. Some men have a weakness for the use of Mercurochrome after irrigation. I think this practice should be condemned. In a discharging ear, it certainly does not reach the seat of infection and by its red staining it obscures the entire field and so interferes with subsequent observation of the drum.

At this stage, if possible, treatment is best continued at the specialist's office. There the ear can be efficiently cleaned by suction and

what is equally important, especially in the adult, the nose can be cleaned and the frequently accompanying sinusitis treated. This may sound like selfish propaganda and yet unless the practitioner is equipped to treat these cases properly it is really doing the patient an injustice to withhold the benefit that such treatment involves. Treatment along these lines must be continued for a period varying from a few days to several weeks until the drum returns to normal and good hearing is resumed.

Before leaving the subject of acute otitis media, I desire to comment on a few of the symptoms and signs.

- (1) Children under two years frequently complain of pain on touching or pulling the outer ear. This, in older children or adults usually means some infection of the canal, but in these young infants due to the fact that the bony canal is not yet developed, movement of the pinna is transmitted directly to the inflamed area.
- (2) Mastoid tenderness is commonly present over the antrum in children with acute otitis media especially of the purulent type due to the fact that in them the antrum and middle ear are practically one cavity. That is why so frequently in very young infants you find not only tenderness but also redness and swelling over the mastoid before the drum is perforated. Lancing of the drum promptly reduces the mastoid signs if the discharge from the ear is adequate. Occasionally it is necessary to incise the supero-posterior wall in infants and this can readily be done in them and thus prevent an operative mastoiditis.
- (3) During the course of a purulent otitis media pain and tenderness over the mastoid may be marked in spite of the fact that the appearance of the drum may not indicate mastoid involvement. To be on the safe side you have an x-ray taken. The radiologist reports destruction of the intercellular septa with exudate present in the mastoid. that mean the patient requires operation? Not always. A conservative otologist who takes all the signs and symptoms into consideration will see many of these cases through without operation. Is the x-ray examination then mistaken? Well, I don't know. Perhaps there is destruction and yet the bone The point is, where the clinical picture does not warrant it, positive x-ray findings should not influence the otologist in favor of operation.
- (4) There is one sign that is very suggestive of mastoid involvement which I have not seen mentioned in the books or elsewhere although, no doubt, it has been observed by others. I have reference to the sensation one

gets when reincising a swollen drum that has closed up prematurely. If your knife enters what feels like a doughy mass and not much pus is released, nine chances out of ten that

patient will require operation,

In the few minutes remaining I shall briefly touch upon one type of chronic infection of the middle ear. This type is characterized by persistent discharge of pus or muco-pus produced by the ordinary pus-producing organisms. It is usually associated with more or less defective hearing. These are the cases which, on account of the absence of any distressing symptoms go on with or without treatment for weeks and months and years and occasionally wind up on the operating table on account of alarming complications.

The ordinary chronic purulent otitis media may follow a single attack of acute infection or more often repeated attacks of acute purulent infection. It is more frequently seen as a result of ear complications of Scarlet Fever, Measles and other infectious diseases. Persistent adenoid infection in children and sheer neglect espécially among the poor and the ignorant accounts for many cases. Another not infrequent source of chronic running ear is the case of operative mastoiditis which is unrecognized or which refuses operation, or upon which an incomplete operation has been performed.

What is the point of transition between acute and chronic suppuration of the middle ear? I was taught to call an ear infection chronic when the discharge persisted for more than six weeks. That in my experience is not exactly accurate. Here again the only true guide is the appearance of the drum. At any stage of a middle-ear infection when a perforation forms which is round and has a smooth edge denoting a distinct loss of membranous tissue, that ear is the seat of chronic infection and should be treated as such.

There is one condition which is frequently confused with chronic infection and that is eczema of the drum and external canal. These cases often have discharge which is easily mistaken for pus and itching is not always a prominent symptom. Examination of the drum, however, fails to reveal any perforation.

Now I shall not enter into the very interesting pathology of chronic suppuration of the middle ear nor will I describe the varied appearances of the drum associated with that

pathology. I have one message to convey with reference to the management of these ears and that is to say that in the vast majority of cases a cure can be effected without resort to radical surgery. This statement, however, should be qualified. By "cure" I mean the arrest of the infective process resulting in a dry ear. Nobody has yet succeeded in replacing parts of the middle ear destroyed by disease. Occasionally, however, I have been able to close up small perforations in the drum with scar tissue and in some cases the hearing has been improved.

Three principles are involved in the successful treatment of patients with chronic suppuration of the middle ear. First, they must be in the hands of a competent otologist. Second, the middle ear must be thoroughly cleaned and followed by third, insufflation of Iodine Powder (Sulzberger). A well-trained otologist is essential because thorough cleaning of the middle ear involves not only the clearing away of discharge, but also the removal of granulomata, polypi and cholestea-

toma

For the purposes of this paper, it is hardly necessary to go into detail about this treatment. Lederman, of this city was the first to introduce the use of this iodine powder in ear infections in 1916. Since then it has been more or less familiar to otologists although far from universally employed. The literature still reports other methods of treatment but with results never approaching that obtained by the use of iodine powder. I, myself have tried a number of other methods and medicaments. For example, I have used instillations of boric acid powder and bichloride of mercury in alcohol, ether, boric acid powder and acriviolet. With all of these methods the results left much to be desired. On the other hand with the exception of cases having anterior perforations communicating with the Eustachian tube, I have yet to fail to clear up discharge from chronic infections of the middle ear, statement goes for cases that have run for as long as thirty years before coming under treatment. In fact so uniformly satisfactory has this treatment been in my hands and in the hands of some of my colleagues that I make bold to say that where a physician uses Iodine Powder (Sulzberger) and fails to clear up a discharging ear he is either dealing with an exceptional case or he does not know how to use this treatment efficiently.

## CERVICAL INSPECTION AND REPAIR WITH SPECIAL REFERENCE TO PRIMARY CERVICAL REPAIR\*

By GLENN A. WOOD, M.D., SYRACUSE, N. Y. From the Department of Obstetrics, Syracuse General Hospital

DESIRE to present this subject of Cervical Inspection and Repair with Special Reference to Primary Cervical Repair, in the hope of convincing you that cervical inspection and repair are needful procedures for the production of good health and longevity among those who give birth to children.

If we follow the highest standards of obstetric practice, the pregnant woman should be discharged in as good a physical condition after her delivery as she was before she became a mother. To this end we now devote much care to antepartum observations and advice, to fine technique during delivery and to careful inspection and repair of vagina and perineum following delivery. However, very few of those doing obstetrics inspect the cervix at any time following the birth of the child to observe the damage that has been done. In my observation of patients returning for their examination six weeks after delivery I have frequently found such lesions of the cervix as lacerations, ectropion, erosions, endocervicitis, often a sub-involuted uterus and very frequently that distressing trouble indicator, leukorrhea. In such cases, I have previously felt that my technique must be faulty, yet, as I observe the same results of other's technique I am convinced that these pathological findings are not unusual but are rather the common results of cervical tears observed after any type of delivery.

As I have talked with medical men who are doing obstetrics from different States of this Country as well as those from Canadian Provinces, practically every one is oblivious to the fact that a severe cervical tear may and very often does result as a, so-called, natural process of labor. Their usual statement is, "I never was taught such a tear occurred. I have never looked for it." If medical men themselves know little or nothing about the cervical tear and the pathologies which it produces, how can the pregnant woman be returned to good physical condition after her delivery?

We are told that about 13,000 women, die annually in the United States from cancer of the uterus, of which, a goodly percentage have a carcinoma of the cervix. According to Graves, "90 to 98 percent of cervical carcinoma has its origin in neglected obstetric lesions." It has been truly said, "The cervix is the only part of the body where such extensive pathology is permitted to remain untreated over such a long period of time Cer-

vical lesions are out of sight except to speculum examination and quite often there will be no disability to call attention of physician or patient"

Let us first consider the etiology of cervical tears. To quote from DeLee4 "Every labor is attended by more or less injury to the cervix, since even the normal uterus cannot stand the enormous radial dilitation required for the passage of the child. Large tears of the cervix result from: 1. Too rapid or too forceful dilitation by the powers of labor (precipitate births) or by the accoucher with his operative deliveries before the os is completely dilated. 2. From disease of the cervix, anatomic rigidity, old primiparity, healed ulcers and scars from former deliveries or operations, cancer, syphylitic or gonorrheal induration, etc. 3. Too large a child or congenital smallness of the cervix. Most tears are of the first class and are due to violence. If the operation is performed before the cervix is completely effaced, serious or even fatal injuries may result. Tearing of the cervix follows the lines of its embrynol construction. At the sides of the cervix there is less muscular and fibrous tissue and here the structure most often gives way, producing the usual bilateral split."

It has been my experience that even the. so-called, normal, easy, non-precipitate labors have produced tears demanding repair. In the normal case the bag of waters and head should gradually dilate the cervix. The head comes through with the average biparietal diameter of 9+cm. Later the shoulders pass through with a bisachromial diameter of 12+cm, which, altho folded, to present a narrower diameter still are wider than the head and do not present the slow, even, ball-like dilating action of the bag of waters and head. It is quite a common sight to see a caput present and after several pains a little trickle of blood appears. I believe this blood results from the cervical tear due to the shoulders tearing through the lower uterine segment which is insufficiently dilated for them to so quickly pass through. I do not wish to belittle the part that "violence" on the part of the operator, may play in the production of the cervical tear but I do feel that the rapid passage of the shoulders through the cervix should receive more blame than the head for the production of the tear in the socalled easy, normal cases in which the cervical tear can be so often demonstrated.

In a series of 25 cases I have purposely omitted the quinine from the Gwathmey method of rectal instillation or the patient was

<sup>\*</sup> Read before the Syracuse Academy of Medicine, November 19, 1929

admitted to the hospital too late for the instillation. I have compared these with 25 patients who have had the quinine in the rectal instillation to determine if the ecbolic action of the quinine was a factor in producing the cervical tear. My conclusions from this procedure are deducted from the following table A.

They, thereby, obtain a clean cut wound as we do in episiotomies

What are the objections one hears to repairing a cervix immediately following delivery—1 The field is too bloody for good vision 2 Due to friability and ædema correct apposition cannot be obtained 3 Infection

The (") marks and the figures 1, 2, 3, refer to the length, in inches, of the cervical lacerations observed, e.g.,1" represents one inch, 1½" represents one and one-half inches, 2" represents two inches, etc

Summary—Counting case No 50 as a 1" tear of each right side, left side and posterior lip there were 45 tears in the 25 cases having the quinine and 43 tears in the 25 cases without the quinine. The average laceration for cases without the quinine was 1 46". The average laceration for cases without the quinine was 1 49".

	WITH QUININE	WITHOUT QUININE
	1	0
	7	3
2" lacerations	_1	1
	14	12
11/2" lacerations	5	7
1 MCCLACIONS	11	16
1 racerations	0	1
1/2" lacerations	4	3

CONCLUSIONS—Quinine in the rectal instillation, in this series of cases, produced a negligible increase in the number of carvical tears. Taking the average, the quinine produced a negligible increase in the amount of tear. Taken singly, more extensive tears were produced with quinine in the instillation. For this series of 50 cases the greater number of cervical tears were from 1" to 2" in length.

It is interesting to note that the French obstetricians believe that Nature does not know how to make a proper dilitation so, as soon as effacement is complete, the cervia is incised

4 The 'what's the use attitude" for with the next baby the repair will again tear out 5 Cervical stenosis will result

Regarding the bloody field-It is my custom

to give I cc. of Pituitrin following the second stage. I wait fifteen to twenty minutes before the placenta is expressed. After the placenta, quite often the patient is able to take by mouth an ergot preparation. If not by mouth, the ergot in proper form is given by hypodermic injection. Massage of the fundus is done if necessary. My experience indicates that with this procedure the field is cleared of blood sufficiently for good vision

Regarding the parts being too friable and cedematous for correct apposition—It is here, especially with the extensive lacerations, that the most careful judgment is required on the part of the operator. In the cases I have primarily repaired I have never felt as I observed the cervix at the six weeks examination that correct apposition had not been obtained.

Regarding infection—Surely one would not repair a cervix any more than one would do any other similar operative procedure in the presence of known or suspected infection. It is my custom to instill about 5ii of a 4% solution of Mercurochrome before the repair is attempted as well as when all repairs are completed. I also have 5ii of the solution instilled into the vagina night and morning for about one week following delivery. Whether or not this technique is a prophylactic for infection following primary repair I cannot state but I feel safer after its use.

For the first 50 cases that I have primarily repaired the average highest temperature on any two successive days was 99.1 (F). Not once have I felt that any increase in temperature was due to infection resulting from the repair of the cervical tear. In all cases in-

volution was rapid and complete.

As a basis of comparison, I have selected 25 hospital cases that I have delivered and who have not had a primary repair of the cervix. The average postpartum temperature on any two successive days was 99.5 or .4 higher than those cases having a primary repair. Also, as a basis of comparison, a recognized obstetric authority in this city has very kindly reviewed for me 25 of his hospital cases that had not had a cervical repair. The average highest temperature on any two successive days in his cases was also 99.5. As the average temperature was lower in those cases having a primary cervical repair, I believe this repair shuts off avenues of infection. Do not these statistics show that under proper environment cervical repair may safely be done without any added risk of infection?

Regarding the "what's the use attitude for with the next baby the cervix will again tear out."—Does one hear this question as an argument against primary repair of vaginal, or perineal lacerations? There are many who advise secondary repair of the cervix after the

With a primary repair child-bearing age. much or all of the pathology is eliminated. When a patient comes back for her check-up examination, it is much easier to get her to co-operate and, if necessary, with a few office treatments with silver nitrate, Mercurochrome, electric cautery, proper douching, etc., discharge her as nearly perfect as she ever could This is more to be preferred than to tell her, "My dear Madam, when you get to be 35 or 40 you should go to the hospital again to have that cervix repaired." Think of all the years of anxiety through which this mother must go when she is told that she needs this secondary repair to prevent the possible development of a cancer. Who knows but that she may develop one in the meantime, to say nothing of the chronically infected cervix with its resulting pathology? True, the next baby may give another cervical tear but why can't that again be repaired?

The patient may have the cervical pathology corrected soon after the six weeks examination even without the primary repair but here I wish to emphasize two points. First, I dare say the big majority of those doing obstetrics today either make no check-up examination at about the sixth week postpartum or, if they do, they are satisfied with the inspection of the vulva and a digital examination. You cannot determine the amount of cervical damage by feeling, you have to see it by aid of a speculum. The second point is, that there is less cervical damage to be repaired, if any, in those patients having had the primary repair than in the cases of those who have not had this repair. make this point more convincing, I ask you to compare in the following tables (B and C) 25 cases not having the primary repair of the cervix with 25 cases who have had this repair.

Regarding cervical stenosis resulting from a primary repair.—My experience has been too limited to report on this possible objection to primary repair. Dr. Irving W. Potter of Buffalo informs me that over a period of more than five years in which he has been making these primary repairs covering in excess of 2,000 cases he has "never seen at a subsequent delivery an undilatable stenosis due to the scar tissue of a previous primary repair." Dr. J. L. Bubis of Cleveland informs me "that over a period of at least fifteen years in which he has been making these primary cervical repairs covering in excess of 1,000 cases it is very rare at the next delivery to meet with an undilatable stenosis due to the scar tissue of a previous primary repair." He feels that at the next delivery the cervix generally tears in the previous scar. Dr. W. C. Danforth of Evanston, III. informs me "that in a period of about four years in which he and his associates have been doing primary cervical repairs he has not seen

TARLE B CASES NOT HAVING PRIMARY CERVICAL REPAIR RESULTS AT THE SIX WEEKS EXAMINATION

at a subsequent delivery an undilatable stenosis due to the scar tissue of a previous primary repair."

There are certain contraindications to doing a primary cervical repair. If hospitalization or its equivalent cannot be obtained no cervical repair should be attempted. In the presence of known or suspected infection, in the presence of shock or exhaustion from prolonged labor, in the presence of toxemia from whatever cause, in the cases of severe postpartum hemorrhage from the placental site or in the presence of retained products of conception, if of any size, no primary repair should be attempted. If, on attempting a primary repair, the cervix was found to be too friable or ædematous for correct apposition, I would surely advise postponing the repair for a few days.

To recapitulate the advantages claimed for primary cervical repair. There is decidedly less cervical pathology to be found in those women who have had this repair than in those who have not so had it. It is my belief that fewer office treatments and a greatly lessened percentage of needful secondary operations are necessary to return the patient to as nearly normal as she ever could hope to be for having had a baby. A more frequent finding is a normal appearing cervix. Some writers on this subjecte stress the rapidity with which the uterus involutes after a primary repair. There were fewer cases of subinvolution in my cases that had had the primary repair. Drs. Grandin

Thickening of the broad ligaments-0.

and Jarman maintain that a primary repair shuts off avenues of sepsis. Dr. Matthews states.8 "If moderate or extensive lacerations of the cervix are repaired immediately after delivery, we minimize or prevent the entrance of infection." My statistics, previously quoted, seem to bear out this contention. That primary repair tends to prevent carcinoma of the cervix is not without its advocates.9 If the source of chronic irritation can be removed, there must be less chance for a carcinoma to develop. This is what a primary repair attempts to do. Owing to peculiarities of the female mind, a certain percentage of those delivered never return for a check-up examination. Those who do not come back, if primarily

repaired, are, to my mind, less liable to a carcinoma or an infected cervix with its resultant sequellæ, than if they had not had this repair.

It is hard to estimate the number of women who are subjectively and objectively suffering from the effects of chronic inflammation of the cervix resulting from child-birth lacerations. Such subjective complaints as pain and soreness in the lower abdomen, bearing down feeling, backache, leukorrhea, etc., may, and frequently do result from the objective findings of lacerations, endocervicitis, ectropion, erosions, subinvolution, metritis, thickening of the broad and utero-sacral ligaments, etc. Primary repair of the cervix, particularly in primiparæ, eliminates this chronic inflammation especially

when followed by the six weeks examination, at which time, if any pathology is found it may be soon corrected.

It is true that an early secondary repair will give the same end results but there is an increased percentage of women who will not return to be told of their needs and, even if told, many will not take the advice. If such patients had been primarily repaired there is no argument. In other words, a known primary repair will benefit many more mothers than a possible secondary repair.

The following is the technique of primary inspection and repair which I have used. The patient is in lithotomy position under anesthesia. The vulva, lower abdomen and inner thighs are well painted with a 4% solution of Mercurochrome and at least 5ii of this solu-tion are instilled into the vagina. The labia are separated with a Gelpi retractor. cervix is grasped with a DeLee cervical forcep and gently pulled to sight. With two or three other DeLee forceps the whole cervix is gradually pulled to view, exposing the torn parts. Gentle downward pressure on the fundus by an assistant aids this exposure. If necessary for better vision, a vaginal retractor is used and traction made by an assistant. Careful inspection of the torn cervix is now made. Before approximating the torn edges, it is my custom to out out any Nabothian cysts in the exposed cervical canal and to remove any diseased tissue that may be present thereby, at-

tempting to cure a pre-existing cervicitis. Regarding sutures—I use a 20-day chromic catgut, doubled, with a cutting point round needle. More tension on the cedematous and friable cervix can be applied without tearing through with the doubled catgut than with the single. Starting above the apex of the Vlaceration and through all cervical tissue but the inner lining, a continuous lock stitch is used. Continuous, because it is quicker and fewer knots are needed. Occasionally, the cervix is too thin to permit sewing to the inner lining, in which event, I include all cervical tissue in the grasp of a needle. The stitches should be fairly snug due to the œdema of some degree usually found. "If not tied snugly, in a few days when the cedema disappears, the stitches will be slack and a good union by primary intention cannot be obtained. It is neglect of this precaution that may cause a failure of the primary repair."10 After all the lacerations are repaired it is very important to see that there is about one inch of cervical canal left for good drainage. After the repair, an assistant grasps the fundus and pulls it, with the repaired cervix, up into its normal position. 3ii of a 4% Mercurochrome solution are again instilled into the vagina. The time needed for this repair is usually not over ten minutes.

In concluding this paper I want to emphasize a few of the points that I have attempted to bring before you. To you who do obstetrics and adhere to the teaching, custom or tradition of not immediately observing the cervical damage after any and all types of delivery, you will be most surprised at the number of cervices needing repair when you do routinely adopt the measure of observing this pathology present.

I wish to again emphasize the importance of a check-up examination at about six weeks postpartum and especially the observation of of the cervix by speculum examination. It is only then that the mother can be correctly informed what procedures, if any, must be undergone to restore her to physical well-being.

Repair of the cervix immediately following the birth of the child offers one means of preventing or lessening the subjective complaints now heard from those having given birth to children. It entirely prevents or greatly lessens the objective pathology to be found at the six weeks examination. If we are ever to lessen the annual mortality in the United States from cervical carcinoma as well as the morbidity of other pathologies resulting from neglected obstetric lesions, obstetricians must give early attention to lesions of the cervix following the birth of the child.

I have purposely omitted from this paper, reference to the intermediate repair of the cervix on the ninth day postpartum as done by Drs. Hirst, Coffey and others, so as not to confuse the two procedures. Both accomplish the same end results. To me, it matters not which procedure is followed so long as the damaged cervix is observed and repaired soon after the birth of the child. In doing this we will render a better service to humanity in making that mother mentally and physically fit to render a better service of herself, to herself and to her family.

## THE APPLICATION OF RADIOLOGY TO THE PRACTICE OF PEDIATRICS WITH INDICATIONS AND CONTRAINDICATIONS

By WALTER L. MATTICK, M.D., BUFFALO, N. Y.

From the State Institute for the Study of Malignant Disease, Buffalo, N. Y., Burton T. Simpson, M.D., Director.

**T**N using the term radiology, I wish to apply it I in the narrower sense of referring to therapy with gamma rays and high voltage x-ray. Even then time will only permit of but a cursory review of this branch of medical science as applied to pediatrics. Such a definition practically limits discussion to the treatment of malignancies or allied conditions of childhood and infancy and in consequence places the radiologist in close association with both the pediatrician and the sur-Thus the radiologist should, if possible, possess good diagnostic skill and a sane view of the advantages of surgical procedures. judgment should not be radical nor should his opinion be based exclusively on a one sided radiologic viewpoint.

The ideal radiologist should possess some surgical ability. Likewise, radiology instead of being a separate specialty should be, as originally instituted, the handmaid of surgery and not a rival method of treatment.

In applying these methods of therapy to infants and children, certain essentials must be con-First, the treatment time must be as short as possible and second, all methods must be simplified to their essentials. Thus, in radium therapy, surface application of heavily filtered radium or emanation in the form of packs, bombs, placques or even the 1 to 3 c.m. packs will be found most useful. This armamentarium is seen to be much simpler than ordinarily used for adults. Likewise with high voltage x-ray therapy, an installation which will eliminate the use of heavy protective rubber and will at the same time admit of the simultaneous presence of parents is most convenient, if not necessary. Such conditions are well fulfilled by most any of the drum type of therapy tube stands now on the market. Short exposure time within the limits of safety is best secured in the treatment of these young apprehensive patients by the use of the larger water-cooled therapy tubes. A comfortable treatment table with an x-ray apparatus capable of a continuous 30 m.a. output at 200 K.V. peak installed as above in a grounded drum with treatment cones of assorted target distances and field sizes would be ideal. Filtration greater than 1/2 m.m. copper is scarcely necessary as under such conditions the mean affective wave length will be .16 anstroms unit, and the radiation beam practically homogeneous.

What are the indications and contraindications for such type of treatment? This is best answered by enumerating some of the pathologic conditions which radiologists are commonly called upon to treat and wherein we can offer

some real measure of cure or palliation. In the former category are benign lesions of which the angioma or strawberry mark forms a frequent example. Such lesions readily respond to radium, placques, tubes or bombs and intensive dosage over a short interval has its advantages in children. As this is the province of the dermatologist and brings us into the field of beta ray therapy, results will not be discussed except to say that they are generally very excellent.

Enlarged thymus of infancy with the accompanying stridor often respond nicely to deep x-ray therapy. Here it is essential to use 25 to 30% of the erythema or skin dose over the thymic area, repeating the treatment at the end of two weeks or longer according to the reaction experienced or the relief obtained.

Bone tumors in infancy and childhood always arouse great apprehension. Here the roentgenologist, clinician and pathologist can render great aid Both benign and in differentiating the type. malignant growths are encountered as in adults. Of the benign growths one of the most common is the bone cyst, generally occurring in the shaft of a long bone, presenting a trabeculated appearance, with a fusiform expansion of the cortex which is intact. There is often a history of frequent fractures of the involved bone. Subjected to deep roentgen therapy these cysts show a deposit of calcium salts and a diminution in size. Parents should always be reminded of possible delayed growth of the rayed bones on account of incidental exposure of the epiphyses.

A quite similar lesion is the so-called giant cell Bloodgood was the first to sarcoma of bone. draw atetntion to the general benignity of these tumors and to suggest the better term "giant cell tumors." These tumors generally occur near the epiphysis of long bones and present a trabeculated or blown out appearance at this point. Their location near the epiphyseal end serves to distinguish them from the closely akin bone cyst. Giant cell tumors are most common from 16 to 25 years of age but may occur in infancy. Until recently patients with these tumors generally sacrificed a limb under the suspicion that such tumors were malignant. Now we know that it is only necessary to curette these bone lesions or better subject them to high-power roentgen therapy or radium pack to produce permanent In such cases properly treated under irradiation therapy the sclerosing of the tumor and the deposits of lime salts can be seen. We have several patients going about their work who have never lost any time under treatment and who today are apparently cured. There is an xanthomatous variety of this tumor which sometimes confuses the pathologist with the resulting mistaken diagnosis of metastatic hypernephroma.

Before entering the field of malignant bone tumors, let me say a word about myositis oss.ficans traumatica. This lesion as the name implies, follows trauma and shows later on the x-ray plate as a deposit of calcium salts in the muscles and fascia surrounding the bone, often in the thigh, shoulder or near the elbow. At times it is difficult to distinguish in the roentgenograph from osteogenic sarcoma. Here a carefully taken history will often elicit the trauma and a re-examination of the x-ray plate and the lesion will often clear up the diagnosis. Just such an incident presented some while ago where this consideration saved a boy's thigh from amputation.

Entering the field of primary malignant bone tumors, we find two principal groups, the osteogenic sarcoma and Ewing's sarcoma.

The osteogenic sarcoma are derived from cells which are the anläge of the osteoblast and are thus all potential bone producing growths as the name implies. They may be defined as osteoblastoma and from the roentgenographic point are best classified as osteoblastic or oseolytic in propensities. These tumors, most common between the ages of 10 and 20 years, do occur in the first decade of life and are often incorrectly diagnosed as acute articular rheumatism on account of the hot fusiform swelling over the lesion. Roentgenographic findings include speckled shadows over the shaft, fan-like or sunray structures of bone spicules and the common perpendicular osteophyte striations often seen in the young, depending on whether osteolytic or osteogenic processes are predominating. The shaft of the bone is generally clearly traceable thru such tumor growths in contradistinction to the giant cell tumor. These sarcoma tend to metastasize to the lungs at an early date whereas generalized bone metastasis as in Ewing's sarcoma are rare. Gumma of bone may be confused with ostenogenic sarcoma but if precautions are taken to obtain a Wassermann, the differential diagnosis is often evident. Chronic osteomyelitis may be difficult to rule out but the occurrence of such a lesion in an individual in previous good health should aid in differentiation from tuberculous joint processes. Biospy is not to be recommended but test radiation will often hasten cell differentiation and make the roentgenographic shadows more dense and clear cut besides relieving pain and the disturbed psychic state of the patient and parents. Neither surgery nor radiation can offer a cure. However, of recent years irradiation is gaining preference in the treatment of these tumors.

The Ewing sarcoma described in 1920 occurs mostly in the shaft of long bones and may be multiple. This is a slow growing tumor. It is

generally incorrectly diagnosed by clinicians and sometimes by pathologists and roentgenologists, as osteomyelitis. When in a young person under 20 years of age a trivial trauma is followed by intermittent pain, insidious fever and intermittent limping with slight or no increase in leucocytes, a tumor of this type is more probable than osteomyelitis.

Metastases are common in bone especially the skull, in regional nodes and the lungs. Roentgen diagnosis may suggest osteomyelitis in the early stage due to evidence of bone absorption in the medulla and the periosteal reaction but the experience of those who have seen most of these tumors warn against the over estimation of either the x-ray picture or the pathologic diagnosis in these tumors. The most characteristic roentgen finding is a destructive lesion of the shaft of a long bone with an osteoblastic type of periosteal reaction resulting in the formation of the almost characteristic longitudinal laminae of new bone These tumors show rapid regression under radia-In fact, due to the limitations of pathologic diagnosis of these growths and dangers of exploration, this constitutes a therapeutic test. If they should tend to recur locally, excision or amputation with radiation can be employed. This tumor while ultimately fatal is generally slower in its progress than osteogenic sarcoma and palliation is marked under irradiation therapy.

Fibrosarcoma or spindle-cell sarcoma may occur in children and on account of its early metastasis by the blood stream is preferably treated by radiation. Under such treatment some very satisfactory results have been achieved in our experience. One such case in a boy of 12 years with a spindle-cell sarcoma of the forearm was well after irradiation from 1917 to 1926. He then developed a recurrence which was removed and the scar irradiated and he has been well since.

Let us now consider one of the most interesting groups of tumor processes, namely the lymphoblastomata, a generic term to include Hodgkin's disease, lymphosarcoma and leukemias. Of all tumor processes this group is probably the most radiosensitive, thus in Hodgkin's disease or lymphosarcoma, gamma rays or deep x-radiation in doses of 80% of the erythema or skin dose over the involved glands or spleen will be followed by rapid regression and disappearance of the tumors. In fact, such a response is almost as reliable as the histologic diagnosis in these conditions and is often used in lack of the latter as a therapeutic test. In spite of such rapid regression or disappearance, other chains of glands generally become involved. These also will melt away under radiation and so forth until by pressure or toxic depression from the disease the patient finally succumbs. Thus radiation while probably failing to ultimately cure these patients does at least keep them more comfortable than any other measure and able to attend school or work with the least possible inconvenience. It is in this group where biopsy is so important, that the pathologist often has one of the most difficult tasks in

making a positive differentiation.

In the leukemias, smaller doses of radiation are necessary. Here 30 to 50% of an erythema dose over the spleen or enlarged glands, repeated in accordance to the response in the blood count, has given best results. When the white blood count approaches the normal, radiation should be In my experience, temporarily discontinued. radiation of the long bones, as often recommended, is of little practical value, in fact, a waste of valuable time, except in rare cases. Thus irradiation treatment with x-ray or gamma rays tends to restore the blood count to normal, improves the general symptoms, restores the feeling of well being and apparently cures the patient temporarily. Although this is the best form of therapy for the ordinary chronic types of leukemias it does not definitely increase their life expectancy. It simply makes them more comfortable during the course of the malady.

In regard to acute leukemias and those of acute or rapid onset, here great caution should be used in administering radiation if it is justifiable to use it at all.

In this same connection, attention should be called to the related condition of chloroma of which we have one case of the myoblastic type. This patient under very mild irradiation dosage received marked relief from the paraplegia and pain in the extremities, the headaches and impaired eyesight, with the disappearance of the exophthalmus and apparent temporary restoration only to die a few months later of a recurrence and terminal pneumonia.

In passing, let me remind that tuberculous nodes respond to irradiation in more than 90% of the cases. Even the most discouraging types complicated with extensive scrofulodermas and suppurating sinus formations can be permanently healed by treatment with 50 to 75% of the skin dose repeated every 3 to 4 weeks. Here aluminum filtered rays at 140 K.V. will work well or a lesser amount of copper filtered x-ray or gamma radiation.

Next we may consider the embryonal tumors of childhood. Two such cases have been irradiated recently at the Institute, one a tumor of the kidney in a boy age three years with slight palliation and the other, a more recent case involving the pelvic organs in a girl of thirteen years with a result that has been quite remarkable even in the light of a probably ultimately hopeless prognosis. In the same category, may be mentioned the case of a child, age eleven years, with a large round cell sarcoma of the ovary. This child had received considerable palliation but died after ten months.

Among the rarer types of malignancies is one

recent case of sarcoma botryoides or rhabdomyoma of the vagina, bladder and uterus in a child, age two years. This child complained of dysuria, a vaginal discharge, the passage of tumors per vagina all of which symptoms should make one suspect this lesion in a child. Radiation of the pelvic region with high powered x-ray produced a complete disappearance of all tumor tissue with marked improvement of the general health of the child. After three months interval this patient has lost her previous gain and shows recurrence of the original growth.

Glioma of the retina in our experience has been quite a common lesion. We have seen this condition in children ranging from twenty months of age to thirteen years. Radiation, either with gamma rays or x-ray, slows the progress of the growth and has produced clinical healing in three of our patients, two of whom had previous enucleation operations and one x-ray irradiation only.

Last but not least, we have seen excellent regression in a child, age nine years, with lupus of long standing involving the whole face on which has engrafted an epithelioma due to repeated radiation for the lupus. Under protestation I treated this case and the results were much more gratifying than could ever have been expected.

After the recital of such a list of indications one might be left somewhat in the position of Dr. Charles Mayo who upon graduation from medical college, lamented the fact that he was about to enter upon a sordid existence in the practice of medicine where future progress would be almost impossible, for his professors in their long, tedious and assuring discourses had seemed to leave no unfathomed possibilities. Such is not the case; radiation is not a panacea. In fact, no patient should be subjected to radiation unless after a reasonable provisional diagnosis or biopsy, this therapy seems justifiable. Treatment should only be given by those thoroughly competent and with standardized armamentarium of known efficiency and output. All irritation of the field of treatment should be carefully avoided i.e., as with diathermy, ultra-violet or infra-red rays, hot water bottles, prolonged use of ice bags, iodine applications, or other irritating ointment.

Such precautions will prevent damage to the skin and save the radiologist the unnecessary accusation of having burned the patient. Should the skin become red, plain cold cream is most satisfactory.

Finally, radiation therapy has produced regressions in tumors such as never before deemed possible. It has raised hopes to the point where some had even predicted the ultimate conquest of malignancy by such means. It has fired the research workers with new vigor in their attempt to illumine with the light of knowledge this enigmatic field of medicine. Its achievements have

been surely most encouraging but until we are able to deal more effectually with the great majority of victims of this disease and produce perimment cures in a larger proportion, we must keep up a vigilant search for better methods in medicine, surgery and radiology before we can hope to cure imalignance in these youthful patients

## THE SACRO-ILIAC SYNDROME\* By G P BERGMANN, M D, MATTITUCK, N Y

HAT there is a displacement of the sacrothat joint which is common, which is accompanied by rather constant symptoms, which is readily recognized, and which is easily corrected was brought to my attention for the first time last fall. I had always considered backache and sacro-iliac pain as one of those indefinite conditions the exact nature of which was obscure, for which little or nothing could be done, and which ordinarily did not arouse any particular interest in the physician. If the pain was severe and gave indications of a sciatica, then one expected the usual trouble. One ordinarily thought of science irritation in terms of focal infection provided there was no history of mjury or strain That meant little or no attention to the back itself but meant a search for dental, tonsillar, smus, intestinal, or numerous other possible foci of intection. If no focus was demonstrable, it meant expectant and symptomatic treatment, the patient in the meantime suffering more or less pain, and being incapacitated for an indefinite period. To say the least treatment was unscientific and unsatisfactory now believe that a percentage of these cases can be relieved at once if treatment is instituted soon enough. The best part of it is that relief from pain is immediate and the patient is able to resume his work in a comparatively short space

That pain in the region of the secro iliac joint is a common event is evident to anyone engaged in general practice. How many times do patients complain of backache? Frequently indeed! Who has not heard this story? "Oh, I have such a backache, just like a toothache right here. It hurts me to stoop or bend, I could hardly get out of bed this morning and could not lace my shoes. The ache makes my legs numb and tingle, it even hurts my calf and toes."

Anatomy The sacio iliac joint is an amphinithrosis or slightly movable joint. In this articulation the osseous surfaces are covered by fibro critilage and connected together by external ligaments. It is capable of limited motion in every direction and hence cripable of being displaced in every direction. The most common displacement, however, is a slipping upward of the thum on the scrum giving a superior displace.

ment At the same time there may be a tilting backward of the ilium giving both a superior and posterior displacement. This is casily explained, on consideration of the forces exerted on this joint. For practical purposes however these two displacements may be considered as one because the symptoms diagnosis, and treat ment are practically the same. It is with this type of displacement that we are concerned here

The symptoms of this condition Symptoms have already been touched upon The patient complains of aching and Inneness in the back He may be able to locate it precisely at the sacio iliac joint on either side, or it may not be so def inite. It probably becomes less definitely localized as the condition becomes older, and as the neighboring muscles become somewhat spastic causing a more widesprend pain distribution. He usually is able to assume some position in which he may be more or less comfortable (such as sitting in a chair with a cushion at his back) only to suffer acute pain on moving or bending. He will usually agree that it is difficult for him to rise from his chair and that he has been unable to lace his shoes If there is sufficient displacement or spism to cause sciatic involvement, he will complain of sciatic irritation This usually manifests itself as a numbress or burning tingling pain through out the course of the sciatic nerve. He may coriplan of pain along the posterior aspect of the thigh, in the gastronomius muscle, or even in the foot The amount of pain (of course) may be of varying degree It may be merely disconfort, or it may be so agonizing as to cause shock or collapse

Examination and Diagnosis Having enough symptoms to suspect sacro iliac displacement we proceed with the examination. This is conducted as follows The patient's back is exposed and he is made to sit relaxed on the side of a table with his toes evenly together on the floor or i stool and his hands on his knees. Inspection and palpation of the thac crests will disclose which is the higher of the two. The higher will in variably be on the side of the pain Now he is made to he relaxed and prone on the table with his toes over the end, and gentle traction is made on both ankles on a line which is the imaginary downward continuation of the spin il column In other words his legs are made strught. A shortening of the lower extremity on the iffected side

<sup>\*</sup> kind before the North Fork Chincal Society, on February 13 1930

will be evident. This will remain constant even after gentle traction on the foot. We now can diagnose a superior displacement of the sacroiliac joint. If the posterior superior iliac spine of that side is more prominent, then there is also some posterior displacement.

Treatment: Treatment consists of reduction or of pushing the ilium downward so that it resumes its proper relationship with the sacrum. With the patient still in the prone position and relaxed, reduction is affected by a quick downward push on the iliac crest. If reduction is successful (and the surprising part is that it usually is) the muscle spasm will relax, the short leg will equal the length of its fellow, and the pain will magically disappear.

#### CASES AND ILLUSTRATIONS

1. (L. T.) Chief Complaint-Lameness in back, leg and shoulder, the result of handling potato sacks. Began on Thursday and became increasingly worse but the patient continued to work until finished on Saturday. On Sunday complained of lameness and pain involving back, right shoulder, and running down right leg. Soreness in calf and toes. In my mind I put this down as a sciatic neuritis of obscure cause rather thinking that it might be due to dental infection as this patient had several crowned teeth. Salicylates with advice regarding x-ray of teeth was the next thought. This man, however, had hard pain and was so helpless that he could hardly turn in bed. Then it occurred to me that a careful examination of the sacro-iliac region might reveal something. It did. I not only found a superior dislocation on right side, but easily affected a reduction. To my astonishment he at once exclaimed that he felt better, and to my amazement he easily got out of bed, moved freely about, and announced that he was ready to go to work. The results in this case were so satisfactory that it stimulated my interest and I have constantly been on the look-out for them since.

2. (Mrs. M. R.) Chief Complaint:—Rheuma-

tism in back.

Past History:—About 18 months ago had arthritic pains in back, legs, knees, shoulders, etc. Had numerous badly decayed teeth. The pains finally yielded after removal of bad teeth and

prolonged salicylate therapy.

Present History:—Began with backache four days ago. "My rhuematism is coming back," she said. This backache had become progressively worse until this morning she had difficulty in getting out of bed, could not bend over to put on her shoes, suffers when she stoops or bends, and is troubled with pain in knees and gastrocemius muscle of both legs. Examination showed typical displacement. Easily reduced with complete relief.

3. (Mr. F. R.) Troubled with backache and

sacro-iliac syndrome for over two weeks. Complained more particularly of burning pain down posterior aspect of right leg, extending into foot. Had tried various remedies for two weeks without improvement. Examination showed a displacement on right side, which was reduced with immediate relief.

4. (Mr. C. B.) Past History:—Had sciatica about four years ago. At that time I strapped his back several times (i. e. the common method of applying adhesive across the sacro-iliac joints with attempted immobilization) gave him electrotherapeutics and intensive medical treatment. He finally recovered after a long period, but was troubled with chronic backache.

Chief Complaint:—Presents sacro-iliac syndrome on right side.

Examination:—Shows marked shortening of the right leg, which was reduced only after several attempts, and yet he did not feel much improved. He reported himself unimproved on the following day. Examination showed same marked shortening of right leg. This was reduced with one manipulation, and was strapped at once before he rose from the table. He felt much relieved, and has had no trouble since. I cite this case because I believe that his old condition interfered with easy reduction, and that the tendency was to slip into its accustomed position rather than stay in its normal position. Once reduced normally strapping was necessary to keep it there. This was probably an additional superior dislocation superimposed upon his old position.

5. (Mrs. S.) Chief Complaint:—Terrible backache. She suggested that she had rectal trouble because attack followed several bowel movements, the result of phenolax. Once before she had the same experience i. e. a backache following the taking of phenolax tablets. Careful questioning elicited the signs of sacro-iliac displacement. Examination revealed the condition to be a superior displacement on the right side. This was easily reduced. Relief was immediate and permanent.

This case was presented because one would not associate a sacro-iliac disturbance with this history. I can only surmise that frequent stool sittings with perhaps more or less straining may have been the cause.

Conclusion: In all cases of backache an examination for sacro-iliac displacement should be made. This will be found to be a common condition. Pain is the result of muscle spasm which is nature's attempt to establish immobilization. This muscle spasm will readily subside if a normal position of the joint is effected. This method of treatment offers a relief that is quicker, easier, and surer than any other which has come to my attention.

### WATER AND SALT IMBALANCE IN HIGH INTESTINAL OBSTRUCTION AND ITS RELATION TO TREATMENT\*

By THOMAS G ORR, MD, and RUSSELL L HADEN, MD, KANSAS CITY, MISSOURI

THE knowledge of the pathology and treatment of acute intestinal obstruction has been greatly increased during the past twenty years by valuable experimental studies G H Whipple and his associates probably have done more than any other group of workers to stimulate interest in the study of this subject from the experimental stand-point

The work that has contributed most to the treatment of intestinal obstruction has been a study of the chemical changes that take place in the blood In 1912 Hartwell and Houget1 learned that the lives of animals with intestinal obstruction could be prolonged more than three weeks by treatment with large quantities of physiologic sodium chloride They did not realize the important role played by sodium chloride, but attributed the prolongation of life to relief of dehydration considered the toxic symptoms due to disintegration of tissues following dehydration produced by vomiting MacCallum, Lintz, Vermilye, Legget and Boas<sup>2</sup> noted a fall in the blood chlorides after ligating the pylorus They attributed the change in chlorides to a loss of hydrochloric acid in the gastric juice through vomiting and that the symptoms were the result of alkalosis They noted that the symptoms could be relieved by injections of sodium chloride Hastings, Murray and Murray3 found a decrease in the chlorine and sodium after pyloric obstruction Grant<sup>4</sup> also found a marked reduction in blood chlorides in a clinical case of pyloric obstruction. Since these observations it has been repeatedly shown that there is a constant fall in the chlorides of the blood in acute pyloric and high intestinal obstructions, With this change in chlorides there is a rise in the non-protein and urea nitrogen and usually a rise in the CO. combining power Such changes also occur in general or lower abdominal peritonitis7 fact that changes in the blood occur in acute peritonitis similar to those in obstructive lesions lends credence to the view that the cause of death in the former condition is due not to bacterial toxaemia but to the associated obstruction of the gut as emphasized by Pringles and Sampson Handleys

The cause of the decrease in blood and urine chlorides is probably best explained by vomiting. While this may be true in high intestinal obstruction and peritoritis, vomiting does not explain the chloride loss from the

\* Read at a meeting of the Rochester, N. Y. Academy of Medicine May 12, 1930

blood in phenimonia and extensive burns. Examination of body tissues has shown a decrease in the chloride content in acute pyloric and intestinal obstruction which is evidence that the chlorides are not retained in the body 10, 11 Gamble and McIver<sup>11</sup>, in experimental work on rabbits, have shown that the loss of sodium and chlorine can be quantitively accounted for in the distended stomach of these animals which do not voint. Their work is quite conclusive and the best explanation yet offered for the loss of body chlorides in obstruction of the upper intestine.

The cause of death in acute intestinal obstruction has been much discussed and many theories presented. In an exhaustive review of this subject, Cooper12 has both begun and ended his discussion with the question 'what is the cause of death in high obstruction?' It seems quite evident that at present a positive answer to this question cannot be given. In general there is a group of workers, who believe that the cause of death is the result of a toxaemia arising from a toxic product derived from the obstructed gut, and another group, who believe that death results from the loss of upper intestinal tract secretions, causing dehydration, hypochloraemia and starvation There is evidently some argument in favor of each viewpoint, but not yet sufficient to make a decision Undoubtedly the loss of water and electrolytes play a major role in the lethal outcome of high bowel obstruction It has been shown that complete dramage of the stomach13, duodenum14 or upper jejunum15 will cause death in experimental animals, producing the same changes in the chemistry of the blood as those found in high obstruction

A destruction of body protein is known to occur as a result of dehydration, causing an increase in the total non protein nitrogen and urca of the blood16 Acidosis also develops Keithir has found the chlorides increased in experimental dehydration. We have contrasted the chemical changes found in the blood in expérimental dehydration and obstruction at the cardiac end of the stomach The non protein and urea nitrogen are increased in both conditions, but more markedly in the latter The chlorides are much increased by dehydration and slightly decreased with obstruction10 The destruction of body protein is in keeping with the findings in acute obstruction but the decrease in the al kalı reserve and the mcrease in the blood chlorides are contradictory findings. It must be remembered, however, that in high intesti-

nal obstruction dehydration is only one of the important factors, and the loss of chlorides and pancreatic juice play major roles. Since the administration of water and sodium chloride prolongs life, the loss of these substances may be an element in the cause of death in simple obstruction.

The most striking observation made in. recent years in the treatment of intestinal obstruction is the effect of sodium chloride solution upon the prolongation of life. Hartwell and Houget first observed this fact. They did not recognize the benefit derived as in any way attributable to the sodium chloride, but considered the relief of dehydration the important factor in treatment. That sodium chloride is essential for the restoration of proper chemical balance in the treatment of the condition is now proven beyond doubt. Gamble and Ross<sup>10</sup> state that sodium chloride is the only one of a long list of salts containing both of the ions specifically required for plasma repair.

The exact action of sodium chloride solution when introduced into the body is not known. It has been definitely proven that if given in proper quantities it will cause a return to within normal limits of the nitrogen; carbon dioxide combining power and chlorides of the blood. It has also been shown by Hughson and Scarff20 that hypertonic solutions of somum chloride have a direct effect upon the bowel by increasing peristalsis. This has led we the use of such solutions by Ross<sup>21</sup>, Coleman" and others to stimulate activity of the powel to hasten evacuation after relief of mechanical obstruction or in paralytic ileus. Gosset, Binet and Petit-Dutaillis<sup>23</sup> give a very dramatic description of results obtained with 10 percent sodium chloride solution, following release of an acute obstruction of the small bowel. Many surgeons have observed that patients having vomiting and distention following abdominal operations are much improved by the giving of physiologic salt solution. It is, therefore, logical to assume that the musculature of the bowel is increased in tone, and the train of symptoms associated with dehydration and abdominal distention are much reduced in frequency and intensity. In some clinics, it seems quite definite that the postoperative convalescence of patients with abdominal operations has been accompanied with less distress, and the complications reduced, since more emphasis has been placed upon the administration of large quantities of salt solution. Abdominal distention, the great care of every surgeon, has been reduced to a minimum when sodium chloride solution has been used in sufficient quantity.

It must be understood that the relief of dehydration and hypochloremia is only a part or an adjunct to the treatment of intestinal obstruction. When making better surgical risks of intestinal obstruction patients by giving large quantities of water and salt, a danger must be recognized. We have observed that the general improvement of the patient after giving salt solution, with cessation of vomiting and decrease in cyanosis, may be misleading and cause dangerous delay in operation. While the value of restoring the lost water and gastrointestinal secretions is recognized, early operation is still the most important factor in reducing the high mortality in intestinal obstruction. No part of the treatment, such as gastric lavage, duodenal tube drainage, enterostomy and intravenous glucose to furnish food and energy, should be neglected. Just what degree of importance the use of the antitoxin of the Bacillus Welchii as advocated by Williams21 will assume is still to be determined. If the real toxic agent in intestinal obstruction were known, the value of this treatment could be better estimated. . The substituting of bile as a specific treatment as recommended by Brockman<sup>25</sup> must be properly judged by future observations.

## CAUSES OF ASTHMA BY INHALATION\* By LOUIS MAMELOK, MD, NEW YORK, N Y.

T is generally recognized that the symptoms in a great many cases of Bronchial Asthma are due to substances present in the air, which upon inhalation are absorbed by the mucous membrane of the upper respiratory tract and give rise to irritation by such absorp-These substances are many and are derived from varied sources as will be described, having but few characteristics in common Due to the fact, however, that they all evert their influence upon the patient as a result of inhalation it is convenient to group them together and designate them as "Inhalants" Since it has been found that about 60% of all cases of asthma are due in whole or in part to the irritation caused by these inhalants, the importance of these as a group is fully *iustified* 

It is the purpose of this paper to enumerate these substances which may be classified as inhalants and to describe the sources from which they are derived, as well as their uses. Many of these are employed in the arts as will be described later.

Inhalants may be divided into Seasonal and Non-Seasonal The only scasonal inhalants are the pollens of trees, grasses, and weeds From March 15th to June 15th the tree pollens cause asthma by inhalation They include several types of Ash, also Beech, Elm, Hickory, Poplar, Maple, and Oak From May 15th to July 15th, occur the pollens of Plantain and of the grasses such as Timothy, Rye, Orchard Grass, Blue Grass, Sweet Vernal Grass, and Bermuda Grass From August 15th to frost, the most important pollens causing asthma are those of the High and Low Ragweed The less important are those of Goldenrod, Aster, Dahla, Sunflower, Corn, Chrysanthemum and Cosmos

Of non-seasonal mhalants, the one most important is dust, particularly house dust and shop dust. House dust consists of those substances gathered by the ordinary vacuum cleaner from rugs, curtains, floor coverings, cushions, bits of feathers, hair from pets, face powder, glue, and insect powder. Shop dust includes dust from bikers' shops where is present wheat and rye dust, dust from jewelers' shops, including saw-dust from bowood wheels, dust from fur shops where particles of fur and preservatives are present, dust from barber shops where is present orns root and rice powder, and dust from the florist shop where various pollens are present

In addition to these more common substances, there is present an unidentified factor

\* From the Clinic of Applied Immunology Department of Medicile New York Lost Craduate Hospital and Medical School

which is specific in type and which often causes asthma in patients who are entirely unsusceptible to all known ingredients such as those just mentioned <sup>1</sup>

The fact that castor bean dust by inhalation could cause asthma was established by Figley and Elrod in 1924. Commercially this is known as pomace. The greatest protein factor in the castor bean is globulin but there is also present active ricin and albumen.

Orns root, one of the most common causes among the inhalants is present in most cosmetics, especially in face and rice powders. A patient susceptible to orns root will develop an attack of asthma not only by using such powder, but thru contact with another person using it.

Feathers play an important part in asthma Chicken duck and goose feathers are used in the stuffing of bedticks quilts cushions, and, principally in pillows Feather susceptible patients should avoid feathers and use instead silk floss or horse hair in their beddings

Among animal emanations that cause asthma are cat, dog, rabbit goat, sheep, horse and cow epithelia. Asthmatics susceptible to these substances usually develop attacks by coming directly in contact with them, although occasionally by indirect contact in the form of wearing apparel. Undyed fur will live a worse effect than dyed fur on susceptible patients.

While there are not so many cases of asthma caused by animal epithelia, it is important to know from what animals are obtained furs that have commercial names The Lyna used for collars of women's coats comes from the Lyny a member of the cat family The Red and Silver Fox Furs come from the fox, a member of the dog family Furs commercially known as Bear or Japanese Wolf come from the goat Persian Lamb or Broadtail comes from the kid Astrakan fur comes from the sheep Fur known as Black Lynx comes from the hare According to the process of preparation, rabbit skin is made into Seal, Hudson Seal, Electric Seal, and Cape Seal 3

Rabbit fur is used in the manufacture of many felt hats. Workers in felt hat factories who are susceptible to rabbit epithelium asthma will have that asthmatic condition aggravated

Rabbit hair is often used as a substitute for feathers in pillows or mattresses. Our Social Service at the Post Graduate Hospital and Medical School which follows up cases at the home of the patient takes samples of contents of the patient's pillows and mattresses. If

rabbit hair is found, he is ordered to change his beddings and this will often cause all his symptoms to disappear.

Rabbits are used as laboratory animals. sometimes as food, and sometimes they are killed and stuffed and used as ornaments on

the wall.

Wool which comes mainly from sheep is divided into (1) Cording wool which includes short fibers, (2) Combing wool which includes long fibers, and (3) coarsest of the long fiber wool known as carpet wool or blanket wool. Undved wool will have a worse effect on patients than dyed wool. Only few cases of wool asthma are present.

Flax is another inhalant that may cause asthma. Flax is divided into fiber and seed. From the fiber is produced the fabric linen used for making (1) Choice tablecloths, (2) Handkerchiefs, (3) Articles of apparel, (4) Nap-kins, (5) Towels, (6) Twine, (7) Rope, (8) Cordage, (9) Sailcloth, and (10) Wings of Aeroplanes. From the seed is made (1) Linseed Oil, (2) Linoleum, (3) Oilcloth, (4) Medicinal preparations as Carron Oil, (5) Ingredients of paints, and (6) Ingredients of varnishes. Most important of all, flaxseed in powdered form is used extensively as poultices for the purpose of counterirritation. A flax-sensitive patient would have his condition aggravated if a flaxseed poultice were applied.

Cottonseed is another cause of asthma. Cottonseed is fed to cows in the winter season and it is suspected that milk coming from cows fed on cottonseed if taken by cottonseed sensitive patients will cause these patients to get

an attack.

Tobacco, an infrequent cause of asthma, is manufactured as cigars, cigarettes, smoking tobacco, chewing tobacco, and snuff. Patients susceptible to tobacco are also often susceptible to tobacco smoke so that if these patients enter a room filled with tobacco smoke they will get an attack. It is interesting to note

that tobacco is used in conjunction with stramonium, lobelia, or cubebs to make asthma cigars and cigarettes, so that a patient who is sensitive to tobacco might have his condition aggravated by smoking cigars or cigarettes specifically prepared for asthmatics.

Insecticides which cause asthma usually contain Pyrethrum. Powdered Pyrethrum is made from blossoms, leaves and twigs of the Pyrethrum plant. The Pyrethrum plant grows in Dalmatia. It is closely related to the Chrysanthemum.

Glue is another inhalant causing asthma. Glue is an animal cement made from animal parings of hoof, hides, tails and bones of animals. The best glue comes from true skins. Fish glue is made from the head, offal and scales of fish. Glue is used extensively in the furniture industry. It is used on ink rollers for printing presses. It is used in calico painting and calsomining. Patent leather has a coat of varnish which has glue.

Mustard, another cause of asthma, is used in It is used extensively as a counterirritant in the form of pastes and plasters. Since mustard baths and pastes are often advised for asthma in children it is easy to see how the mustard sensitive asthma infant would have his condition aggravated.

#### Conclusion

A list is given of various substances which, upon inhalation, cause asthma in individuals sensitive to them. These substances are met with in every-day life.

#### PERIODIC HEALTH EXAMINATION\*

By W. H. ROSS, M.D., BRENTWOOD, N. Y.

HERE has never been a time in the history of medicine when so much effort was being made, by the leaders of medicine to give the public the benefit of health progress as methods to prevent disease develop.

\* Read at the public meeting sponsored by the Committee on Periodic Health Examination of the Medical Society of the State of New York, at Rochester, N. Y., June 4, 1930.

There is a very definite change in public sentiment health and practice and administration. We have passed from the stage when it was thought that general cleanliness only was sufficient to protect from disease into the stage of seeking with laboratory help, the sources of disease.

It is not new to say that we have gained more knowledge in the last fifty years regarding communicable disease than in all previous times. Public health is no longer content to treat the sick, and to take measures only to control the spread of disease, after disease has made its appearance, but to find through laboratory examinations the cause of disease and to prevent their appearance at all immunization. "Physicians have come to be increasingly the conservers and suppliers of the positive commodity of good health, decreasingly the emergency repair men called in when some-

thing has gone wrong." The medical profession is now systematically advocating a new stage in medicine. It is chiefly characterized by an effort to make an earlier diagnosis and at a time when disease is in its incipiency, or in the preclinical stage which simply means before it has produced any symptoms that the patient feels. Medicine advocates a physical health examination for every one at regular intervals and corroborated by laboratory tests, blood chemistry and the use of instrumentary precision, for measuring functions of organs; the giving of advice regarding general habits of, eating, sleeping, working and recreation, and others, and treatment if needed at a time when it can be most surely effective, i.e., when disease is in a preventable or remediable stage-to the end that life may be lived comfortably, happily and efficiently.

There has never been as great an effort to increase interest in health examinations at regular intervals as during the present year under the leadership of Dr. Ward Crampton of New York

Medicine is organized for the advancement of its science and the making of medical knowledge available to the public. This is one of the ideals of medicine.

There are several reasons for the rather sudden public interest in prevention medicine, but none are greater than that medicine has come to have a public character because the public knows more about it and more about what can be had in health service. There are two kinds of medical service; one applied when people. are sick,-the other before they get sick and the latter is made up of such things as prenatal care, infant welfare or well-baby clinics, general immunization and periodic health examination. The general adoption of this form of service by the profession of medicine work by the public is an ideal of the future but it is steadily advancing in the present. It may soon go faster. We are in a new social era with a different economic status. The general principle of higher wages and a greater appeal in the cost of living and wages in recent years so that the purchasing power of wages is relatively higher than ever before; combined with shorter hours of labor, and the increase in man hour productively of 60% in less than fifty years, satisfying better than ever before the wants of people. People have, therefore, more leisure and greater capacity to consume material things and pay attention to health. These things are likely to increase as the result of other factors, i.e. use of power is now increasing 33/4 times faster than population I quote the following from the conclusions of the committee on recent economic changes: "The use of public utilities and the economic activity of the last seven years has given us 20,000 miles of airways, moves a billion and a half tons of freight; has placed 25,000,000 motor cars on the highways; has built good roads that go in all directions; has carried electricity to 17,000,-000 homes; sent 33/4 million children to high school and a million to colleges-and has fed, housed, clothed and amused 120,000,000 people better than ever before. It takes only a moment of thinking along these economic developments to see "the change in our national life," and it does not require much thought to see that the public may soon demand more of the medical profession than just to cure them when they get sick.

Since man has always feared pain and death, the social trends in the last few years have turned, among other things, to health service. The public have become health conscious just as they have become amusement conscious, and new conditions confront not only the medical profession, but health organizations and welfare agencies.

There is among the thinking public a growing demand for better health.

The medical profession, public health agencies, the medical teachers, lay health agencies and the thinking public all agree that doctors should put into their daily practice, preventive measures in the same spirit that they are curative measures and that it is in the interest of one of the purposes of organized medicine to do so.

Medicine is on the edge of making practical application of available medical knowledge. It is more than ever endeavoring to conform to the measure that Osler has given us when he said that medical advance is to be measured by its availability to the public.

Organized medicine in this State is sponsoring a broad program of health conservation and it is intresting to state that civic bodies are assisting in the general educational program of periodic health examinations for apparently healthy persons.

The Medical Society of the State of New York is committed to this service.

#### SECTION OFFICERS

Medicine—John Wyckoff, M.D., Chairman, New York; David A. Haller, M.D., Secretary, Rochester.

Surgery—Charles W. Webb, M.D., Chairman, New York; David B. Haller, M.D., Secretary, Rochester.

Obstetrics and Gynecology—Onslow A. Gordon, Jr., M.D., Chairman, Brooklyn; George H. Bonneyond, M.D., Secretary, Uticz.

Pediatrics—Marshall C. Pease, M.D., Chairman, New York; Douglas P. Arnold, M.D., Vice-Chairman, Buffalo; Brewster C. Doust,

M.D., Secretary, Syracuse.

Eye, Ear, Nose and Throat—Conrad Berens, M.D., Chairman, New York; Richard T. Atkins, M.D., Secretary, New York.

Public Health, Hygiene and Sanitation—Arthur T. Davis, M.D., Chairman, Riverhead; Frank W. Laidlan, M.D., Secretary, Middletown.

Neurology and Psychiatry—Noble R. Chaubers, M.D., Chairman, Syracuse; Irving J. Sands, M.D., Secretary, Brooklyn.

Dermatology and Syphilology—Earl D. Oseorne, M.D., Chairman, Buffalo; Leo Spiegel, M.D., Secretary, New York.

Office at 15 Park Place, New York. Telephone, Barclay 5550

Counsel-Lorenz J. Brosnan, Esq.

Consulting Counsel-Lloyd P. STRYKER, Esq.

Attorney-Thomas H. Clearwater, Esq.

Executive Officer-Joseph S. Lawrence, M.D., 100 State St., Albany, Telephone Main 4-4214. For list of officers of County Medical Societies, see this issue, advertising page xxxii.

Next Annual Meeting, Hotel Syracuse, Syracuse.

#### PERSONAL CONTACT

More can be accomplished by personal contact than by the printed page. The three conierences recorded on pages 1176 to 1181 of this Journal produced results more definite and concrete than a year of printing and letter writing. But let no one be misled by these seemingly spontaneous results, for they were the end products of months of reading impersonal reports. The county secretaries and

committee chairmen had read the reports and instructions in the Journal, but they did not realize their personal responsibility for applying them in their own communities. Personal contact with the leaders of the State Society is the spark which actuates the motive power of the local workers. The reports in the Journal and the bulletins of the committees are the fuel which supplies the power.

#### PRESIDENTIAL COMMENTS ON CURRENT EVENTS-NO. 7

In the last two weeks organized medicine in this State has further extended the use of the principle of conference in reaching conclusions regard-

ing its programs and policies

Conference of Chairmen of Standing Committees of the State Social. The chairmen of the Standing and Special Committees met for the first time to discuss their plans and proposed activities for the coming year. The purpose was to harmonize the parts of the program, and to prevent duplication with its waste of effort and money, also, not to undertake impractical features. There was a discussion of methods of efficiency and how best to adjust the program to professional needs, and to add the profession in meeting its public obligations.

The executive officers of the Society were present. These fifteen men had lunch together and afterward discussed methods of practical publicity for the purpose of informing the officers and committeemen of the County Societies of the

State

While there is a certain amount of apathy in some of the County Societies, my study of the situation convinces me that it is due solely to lack of information. The ideals of any one group of doctors are just as great as those any other group. The sole difference is that some have become active sooner than others because they have received information of the State policies sooner.

Conference of Chairmen of County Public Relations Committees The chairmen of the Pub lic Relations Committees of the County Societies niet this year for the first time The purpose was to hear reports of what they had done, and to discuss what there was to do in the State for the betterment of public welfare and the practical interests of the profession by establishing modern relationships with every organization having health interests Organized medicine, through this committee, is seeking constructive cooperation with the interested public This year the Public Relations Committee will be aided in informing itself of the public health activities and other accomplishments of the counties by the President's message at each District Branch meeting This consists essentially of showing the accomplishments of each county in public health and in scientific The State Committee, as soon as it medicine has acquired knowledge of the activities of County Societies, will be in a position to further assist constructively the committees of the County So cietics in establishing proper relationship and cooperation, and to bring to the various public health agencies, with other organizations, the suggestions and criticism of organized medicine

A decided advance was made as the result of the conference of county chairmen in an understanding of the value of the work of the State Committee. The interest shown by those who attended was unusual. Listening to the discussions, it was surprising to learn how very far some groups had gone in civic medicine. Professionalism still actuates men. Commercialism is not the aim of medicine. There is more in medicine than curing disease for pay.

Governor's Health Commission The Special Health Commission will meet from now on once a month It will have a report of obvious needs ready, probably as early as January next Many of the questions before it are so knotty that it will take longer to work out the answers Who should control health work in schools? To what extent shall State aid for health activities be ex-These are fundamental questions and involve much interest to the public and to the medical profession To what extent shall State authority be extended to county organizations for the better administration of public health in counties in which the organization of health depart ments is not desired?

I wish I could comment on this in capital letters

The local profession has the chance now to lead the practice of public health in any county by organizing a health department as Cattaraugus, Suffolk, Westchester, and Cortland have done, and as the County Societies in Wayne and in Jefterson have within two weeks requested, by unanimous resolution, their county governments to do Here is a "little cloud, like a man's hand" Will the profession see it in time? To fail in wisdom now seems absurd. If the profession wants to continue as a mighty force in human affairs, should we not have public sentiment aid us, instead of oppose us?

District Branch Meetings The President's Message to the District Branch meetings this year is being presented by stating the public health accomplishments of each county in the District as well as the facilities for medical care in each County, and in the District as a whole An effort is thus made to measure the profession's response to its public obligation

In the Third District of seven counties it was found that there was ample general and special hospital facilities, ample Inboratory service, and that seventy-two public health, tuberculosis, and school nurses were working in the District. In general, the profession of this District have reason to be encouraged for its excellent public health work.

W. H. Ross

#### APPORTIONING COUNTY SOCIETY ACTIVITIES

The activities of a county medical society, like those of a family doctor, are many and various. The criticism is frequently heard that each officer of the State Society, and each chairman of a committee, gives the impression that his particular activity is the most important of all, and requires the immediate and undivided attention of the members of the county societies.

It is difficult to assign relative values to the several standard activities of a county society. Each activity is a unit in itself, although it fits into the complete plan of the society. There is a standard method of conducting an anti-diphtheria campaign, for example, and a considerable literature has sprung up on that subject alone. If a member of a county society who is unfamiliar with the broad range of society activities were to read an appeal for the campaign, he might think that activity to be about all that the society is considering.

Certain activities of county medical societies are so fundamental that they are almost common place. A scientific paper or clinic, for example, is universally considered to be the principal event on a program. The publication committee of every State Society recognizes that fact, and gives to it the greatest amount of space and the most prominent position of any department in its journal. Yet the sections devoted to news and to editorials carry but a small amount of discussion of the scientific program simply because the scientific activities of a society are standardized and uniform throughout the Nation.

Medical societies must develop new activities in order to give all forms of modern medical services to a community. department of this Journal devotes a considerable amount of space in each issue to the newer methods of medical practice by county medical societies. This present issue, for example, contains reports of three conferences held under the auspices of the State Society for the purpose of constructing practical programs for carrying on the necessary activities of county medical societies. Only a small amount of space is given to activities and methods which have become well known and standardized; but the greater part of the space is devoted to discussions of new activities and new methods. This fact is no indication that the State Society is riding the crest of every wave of progress—it indicates that the leaders of the State Society are alert to develop every form of medical service that a community needs.

If one were to judge the activities of a society by the reports in any single issue of the New York State Journal of Medicine, he might have some grounds for the opinion that the State Society is giving an undue amount of attention to newer forms of medical practice to the neglect of the old standard activities. But turn back to the index published in the issue of December fifteenth of each year, and one will find that the activities of the New York State Medical Society, both old and new, are well apportioned, and that every field of medical service is well covered.

#### LOOKING BACKWARD

### This Journal Twenty-five Years Ago

Principles of Professional Conduct: When the present organization of the Medical Society of the State of New York was in process of formation the adoption of the Principles of Medical Ethics of the American Medical Association was considered and this Journal of October, 1905, gave notice of a referendum vote on the subject. The vote was taken in May, 1906, and was unanimously in favor of the A. M. A. code.

The Medical Society of the State of New York adhered to that original code, but did not adopt

the new A. M. A. when the old one was revised in about the year 1914. There does not seem to have been much dissatisfaction over either the old A. M. A. code of the American Medical Association or the revised one; but on May 21, 1923, the New York State Society adopted an ethical code of its own, and called it "Principles of Professional Conduct." The most apparent difference between the two codes is that the one of New York is only half as long as that of the American Medical Association.

### 2

## MEDICAL PROGRESS

The Calot Treatment of Surgical Tuberculosis .- Dr. F. Calot of Berk-Plage contributes to the Patrik Haglund Festschrift of the Acta Chirurgica Scandinavica, June 18, 1930, a comprehensive article on the bloodless treatment of tuberculosis of the bones, joints and lymphnodes. During the first three years of practice, he said, he operated in all cases of surgical tuberculosis, following the axiom of Trélat of complete and immediate extipation of all accessible tuberculosis foci, as of malignant pustule and cancer. But soon clinical observation and pathological study convinced him that this dogmatic view was false and that tuberculosis could not be treated like cancer; and that the subjects of surgical tuberculosis usually recover provided their general condition is satisfactorily treated and the peripheral focus is suitably dealt with. On the other hand an open operation only serves to cause a wider dissemination of the pathogenic germs, like the harrowing of a well sown field, and moreover frequently leaves one or more fistulous tracts the purulent discharge from which saps the patient's strength. The author's method, as many know, consists in the injection of certain substances to act upon the focus of disease. When an abscess is present the pus is aspirated and then a sclerosing liquid is injected. This consists of guaiacol, 1, creosote, 5, iodoform, 10, in a mixture of ether, 30, and oil 70. Of this the amount injected varies from 3 to 12 grams according to the age of the patient and the size of the abscess. When the cold abscess contains grumous matter clogging the aspirator needle it is necessary to liquely the material by two or three injections of a mixture of 2 grams of naphthol camphor in 12 grams of glycerin. As this latter is not a true solution the bottle should be vigorously shaken for at least a minute and a half and the suspension then injected immediately. After this the abscess is to be treated by aspiration and sclerosing injection, as above. To melt down hard foci (adenitis, epididymitis, etc.) the author injects a mixture of equal parts of sulphoricinated phenol, essence of turpentine, camphorated naphthol and camphorated phenol, 8 drops into the center of the indurated focus, which four times in five liquefies the contents in three days, but if not, the injection is repeated and then the desired result is obtained. To cause a sclerosis of fungous foci the phenol-iodoform liquid as above given, is injected. For the treatment of tuberculous fistulæ Calot employs

an ointment of camphorated phenol and camphorated naphthol, each 3 grams, guaiacol 8, iodoform 10, in spermaceti or lanolin, 100. The liquefaction of this ointment is effected at a temperature of 104° F or a little above, 10 or 15 grams is the amount used in the case of children and double this for adults. Finally the powder he uses for dusting tuberculous surfaces is composed of aristol, 4 grams, bismuth subnitrate, 10, powdered gray cinchona bark, powdered Siam benzoin, and magnesium carbonate, of each 30, essence of eucalyptus, 3. In conclusion the writer insists, as a sine qua non of success, that the method must be well mastered and applied because its technique is precise, and its carrying out calls for great attention and perseverance.

Gas Gangrene in Civil Surgery.—Nils L. Eckhoff reports in brief 23 cases of gas gangrene occurring in the course of six years at Guy's Hospital, London. These were divided into accident and non-accident cases, stress being laid upon the occurrence of gas infection complicating "clean" operations, there being eleven of the latter and twelve of the former. The symptoms and clinical course in the accident cases were the same as those familiar to surgeons in the World War but may profitably be reviewed at this date.

The disease occurs at a variable time after the receipt of a wound, especially of a lacerated one, associated with much trauma, and is most common in the case of street accidents. One of the earliest symptoms is pain coming on thirty-six to forty-eight hours after the injury, accompanied by a rapid rise of temperature and pulse. Other local symptoms are crepitation, extending centrifugally from the wound, great tenseness of the skin, with alternating anemic and reddish black patches, exquisite tenderness, and a brownish-yellow, evilsmelling discharge from the wound. author stresses these features since it is by familiarity with them that gas infection may be recognized in non-accident cases,

The indication is for radical excision of the affected part, which can be easily carried out in the limbs but is not possible when the infection occurs on the trunk. In such cases, however, much good may be accomplished by early incisions, irrigation with hydrogen peroxide and flavine. The early and plentiful administration of serum is insisted upon, especially in cases in which complete excision of the infected region is not possible. Apart from

manifested cases of gas gangrene, the author says great success has followed the administration of serum in cases of unexplained abdominal distention with constitutional disturbance following straightforward abdominal operations, such as cholecystectomy. Prophylactic injections of serum are recommended in all cases of street accidents with open and lacerated wounds.—The British Journal of Surgery, July, 1930, xviii, 69.

Primary Diphtheria of the Nostrils.-Dr. L. Rachmilewitz reports a case of a thin and anemic boy of 61/2 years, who had suffered for two weeks from nosebleed and complete stoppage of respiration through the nose. examination, the lungs, heart, and abdominal organs were found to be normal; there was no redness or swelling of the tonsils, and nothing pathological could be seen in the mucous membrane of the oral cavity, the pharynx, or the larynx; the temperature was normal, the appetite was good, and except for the discomfort from the nasal obstruction and the more or less continued epistaxis, the child felt well and went about and played as usual. Examination of the nose showed both nostrils filled with a sanguinopurulent secretion and a silvery white membrane covering the septum and turbinated bodies.

On the strength of this, the author ventured a diagnosis of nasal diphtheria, which was confirmed by the finding of diphtheria bacilli in pure culture. The patient had no sore throat and there had been no operation in the mouth, nose, or nasopharynx. Treatment consisted in the intramuscular injection of 3,000 units of antitoxin and the instillation of 5 drops of the same in each nostril three times a day. At the end of a week there was only a slight mucous discharge from the nostrils and the membrane had almost entirely disappeared. — Deutsche medizinische Wochenschrift, August 1, 1930.

Sodium Chloride in Ileus.—R. Patry, writing in the Schweizerische medizinische Wochenschrift, July 19, 1930, calls attention to the great value of physiological salt solution in counteracting the toxic symptoms in ileus. These are: increase of urea and nitrogenous waste in the blood; thickening of the blood, with hyperglobulia and increase in hemoglobin percentage by reason of the diminution of the fluid portion; increase of the alkali in the blood: diminution of the chlorides in the blood, sometimes amounting to a loss of a half or even two-thirds of the normal percentage. Various experimenters have found that the life of an animal with intestinal obstruction is greatly prolonged by the administration of

chlorides, especially of the sodium salt. This antitoxic action of sodium chloride has been verified in man clinically by numerous observers, especially Americans. The author gives 100 c.c. of a 20 per cent NaCl solution in five doses of 20 c.c. each intravenously, in the course of twenty-four hours. To compensate for the loss of water a liter of physiological salt solution is given subcutaneously. This treatment is continued for two days after operative relief of the obstruction.

By way of prophylaxis it is well to begin the sodium chloride administration immediately upon completion of the operation. On the theory that the diminution of the chlorides is due in large measure to the vomiting, the author thinks we should look for good results in other cases of incoercible vomiting not dependent upon ileus, as, for example, in the

vomiting of pregnancy.

Prophylaxis of Diphtheria by Means of an Immunizing Ointment.—Dr. Elisabeth Urbanitzky of Vienna, writing in the Deutsche medisinische Wochenschrift of August 8, 1930, discusses the various methods of protection against diphtheria. 1. The production of passive immunity by the injection of antitoxin is absolutely protective, but there are two serious disadvantages of the method. In the first place the immunity lasts but a short time, and, secondly, there is the danger of an anaphylactic reaction if the serum is given again during a subsequent epidemic. 2. Active immunity by toxin-antitoxin is also effective, but it too has its disadvantages. according to the author. She says that many fatalities have been reported in European countries as well as in America and Australia, and there is still the danger of anaphylaxis when three injections are given. A second method of producing active immunity, which the author favors, is by the inunction of a salve containing diphtheria germs in pure culture rendered avirulent by the action of formalin and light. theory that underlies the percutaneous method, Dr. Urbanitzky says, rests upon the fact that practically only the exanthematous diseases, i.e., those with dermatotropic manifestations, such as smallpox, measles, scarlet fever, etc., confer absolute immunity by one attack. She put this method to the test in a children's home, all the inmates, both children and adults, 93 in number, whether Schick positive or negative, being treat-The inunctions were made three times at intervals of two months. The results were most satisfactory. The inunctions were begun in January, 1929, and during that year there was not a single case in the Institution, while for the five years previously the number of cases each vear ranged from 5 to 8. Moreover during 1929 Vienna was visited by an epidemic of diphtheria

and many severe and septic cases occurred outside the Institution. The author's conclusions are that the method is absolutely harmless, easily applied, and more certain than antitoxin injections. The immunity produced is active and lasts at least a year and probably longer. It causes neither a negative phase nor anaphylaxis.

The Nonvalvular Diseases of the Heart in Middle Life.-After quoting statistics which show that heart disease is apparently firmly emplaced as the leading cause of death, David Riesman states that the problem which this situation presents is difficult. The causes of heart diseases are manifold and often entirely elude us, and without a knowledge of the causes no problem can be successfully attacked. We know something of the rôle of syphilis and rheumatism in the causation of heart disease, but the profession as a whole is not sufficiently aware of the importance of rheumatism and of the means of combating it. Systematic health examinations, removal of diseased tonsils, improvement in domiciliary and community hygiene, and regulation of diet go far toward lessening the ravages of this disease. The more obscure causes of heart disease can be discovered only by making it a practice to take a searching history in every case. Among the more obscure causes are latent syphilis, focal infection (especially of the gall-bladder), infectious diseases, over-eating, excessive use of tobacco, and, most important, the general mode and habits of life. Overweaning ambition with all it implies in striving and neglect of self is an outstanding factor in the history of an ever-increasing number of cases. The early manifestations of myocardial weakness are the respiratory, the digestive, the painful, and the oppressive. The digestive type is important because of the possible grave errors in diagnosis. One should never make a diagnosis of indigestion in a patient of 50 years or over without a careful consideration of the heart and circulation. While pain may be the first thing to attract attention to the heart it can scarcely be looked upon as the beginning of the disease. There must be a more or less prolonged incubative period, the earlier detection of which should he our aim. If a patient's family history indicates any weakness of the heart or circulation, his life should be so regulated as to conserve the integrity of the cardiovascular system. In addition to rest, a simple diet, and digitalis, if there are signs of congestive failure or of auricular fibrillation, Riesman finds that carbohydrates in the form of sugar or glucose are beneficial in myocardial cases. To control gaseous distention figuids should be limited to a total of 1200 c.c. (2-3 fruits) a day. Calcium lactate in doses of 6 decigrams (10 grains), three times a day, frequently acts beneficially. Tobacco is permitted only in the greatest moderation. In resuming exercise, the patient, especially the golf player.

should be extremely careful not to overdo .-- Bulletin of the New York Academy of Medicine. August, 1930, vi, 8.

Psychiatry's Part in Preventive Medicine .-Arthur H. Ruggles points to the fact that in some mental hospitals the cases of general paresis have in ten years been greatly reduced. This he believes is in part due to the employment of preventive steps insisted upon by the syphilologist and psychiatrist. Since the Great War facilities for the segregation of some of the feebleminded and for the community treatment of others have been established in nearly every State. This in another generation should lessen the propagation of the mental defective. The misnomer "shell shock" brought to the attention of laymen and physicians alike many cases of psychoneuroses that would otherwise have gone without understanding or treatment, and consequently many have been cured of minor psychoses, thus tending to reduce the number of nervous invalids in the community. Today every psychopathic hospital, and many State and private mental hospitals, have out-patient departments where large numbers of psychoneurotics and incipient psychotics are treated. Here the psychiatrist, the psychologist, and the psychiatric social worker (who is a very important factor in the work) examine, investigate, and treat psychoneurotics, and incipient psychotics, such as the subjects of mild depressions, hypomanic states, early schizophrenia, general paresis, and other types of cases in which institutional treatment is not indicated: thus many psychotic patients are readjusted or stabilized sufficiently so that they never need to go into a mental hospital. In the mental health program no better policy could be established than that for each dollar spent for building an equal amount be devoted to prevention. The greatest contribution of the psychiatrist to preventive medicine is the insistence on the understanding of the patient as a total human being, with emotions as well as tonsils, with conflicts as well as a heart, and with thwarted purposes as well as a gastrointestinal tract. The psychiatrist does not think that all disease is "located in the mind," but takes full cognizance of a possible physical basis, and he often finds that a physical condition is exerting a marked influence on the mental state. Psychiatry still has a very great contribution to make to preventive medicine in the field of a better understanding of the etiology of a large group of psychoses. It will have much more to contribute if medical education trains all physicians to understand and treat the whole human being and not simply a diseased section,-Bulletin of the New York Academy of Medicine, July, 1930.

Treatment of Prostatic Hypertrophy by Radiotherapy and Vasectomy.-K. Fischer and H. Schreus of Düsseldorf report 30 cases of hypertrophy of the prostate gland, treated with benefit, as a rule, by means of vasectomy or roentgen therapy, alone or in combination, with or without retention catheterization. Of cases of the first degree in which a radical operation was not yet indicated, there were seven, in five of which vasectomy alone was performed, in the remaining two radiotherapy being also employed. All of these were either entirely relieved or notably improved: the distressing impulsion to urinate and the stammering at the beginning of micturition wholly disappeared and sleep was much less disturbed. In one case the vasectomy gave slight relief, but x-ray treatment, instituted nine months later, caused marked benefit. Excellent results were obtained also in the inoperable cases and in those in which operations were refused by the patient. In these cases the x-ray applications can hardly do any harm, but on the contrary may almost always be depended upon to bring about an improvement when a previous vasectomy and permanent catheterization have not had satisfac-In five of 23 inoperable cases tory results. the treatment consisted of roentgen radiation alone and the results appear to have been as good as those following vasectomy alone or the combined treatment. The authors conclude that, while always advising a radical operation in advanced but operable cases, when for any reason an operation is inadvisable, the use of roentgen radiation alone or combined with vasectomy is to be urgently recommended.—Münchener medizinische Wochenschrift, July 25, 1930.

On the Mechanism of Cancer Development. -Horst Oertel states that, as has been known for a long while, cancer never arises suddenly or spontaneously from normal tissues. Every tumor arises from a local germinative tumor center, which is furnished by primary developmental structural faults or by perverted regenerations. Kreyberg has demonstrated that in experimental tar cancer of the skin the cancerous growth is ushered in, as the first step, by a permanent hyperemia of the skin vessels; their contractile function has been irreparably damaged. As a consequence of the greater blood and oxygen supply all the tissues grow and increase, but where the hyperemia is greatest the epithelial cells begin to run ahead and grow to warty excrescences. Some of the dilated non-contractile vessels are obstructed or narrowed by blood clots, hence a tissue which is at first over-supplied with nutrient material and oxygen is now deprived of both. In places where the nutrition of the part is entirely interfered with, these warty epithelial growths die, undergo necrosis; in other places they remain warts, and in still other places they become cancerous. This malignant transformation occurs, therefore, in the

tion through vasomotor and other nerves, have been so shifted that the normal process of cell regeneration is fundamentally and permanently interfered with. Thus arise cell mutations with abbreviated differentiation. The tumor is therefore not a lawless growth, but rather the lawful result of a we'll-defined sequence of events, by which the entire biological tissue characters and consequently the relations of its components, are rearranged. The cancer cells, thus produced, are not open to those physiological environmental tissue influences which normally determine relative position and differentiation in new cells. Hence they grow as a new entity, with their own blood and nerve supplies which are adapted only to their growth. The physiological, stationary, fully differentiated tissue is thus replaced wherever the atypical cancer cells grow, not by an aggression of the tumor cells but by supersession of a new actively growing tissue organization which is grafted upon an old stationary one. The tumor problem can be solved only by sober, necessarily slow, intensive penetration into the laws that govern growth, because the tumor problem is a problem of growth.—Canadian Medical Association Journal, August, 1930, xxiii, 2.

The Diagnostic Value of Auscultation of the Arteries in the Neck.—Drs. Anastasius Landau and Joseph Held of Warsaw, formulate the following conclusions in an article on this subject appearing in the Archives des Maladies du Cœur, August, 1930.

1. In senile atheroma of the aorta and in cases of arterial hypertension, auscultation of the aorta in the two classical areas—the second right intercostal space near the sternum and the manubrium sterni—affords no reliable information regarding the actual state of this vessel. In such a case, auscultation of the arteries in the neck may reveal a systolic murmur or a loud, metallic diastolic sound, or sometimes the two together. They are usually especially distinct over the right carotid.

2. In syphilitic aortitis, the second aortic sound and also the diastolic murmur in the arteries of the neck are often very loud and sometimes metallic in quality. The first sound is generally a blowing murmur in the aortic area, extending, as in atheromatous aortitis, into the vessels of the neck, more particularly the right carotid, in a certain number of cases. In an important group of cases of syphilitic aortitis this systolic murmur is heard with maximum intensity in the vessels of the left side of the neck, in particular the left subclavian. In certain cases there is a weakening of pulsations in the left side, but in others the pulsations in the two sides are equal. While in the first case one might imagine a narrowing of the orifice of the left subclavian, it is difficult to

### LEGAL

#### MEDICINE AND LAW JOIN TO SAVE THE LIFE OF A CHILD

By LORINZ J BROSNAN, ESQ Counsel Medical Society of the State of New York

A very interesting case demonstrating the flexibility and pliancy of the law, its ability to cope with new situations and its unending zeal for the welfare of its citizens trose recently in one of our Children's Courts. The facts are brief. A mother refused to permit physicians to attend her thirteen-year old son who was suffering from empyema, for which an operation was imperative. The attention of the Society for the Prevention of Cruelty to Children was directed to the case, and they instituted legal proceedings to force the mother to permit the necessary medical attention.

The Court granted the relief prayed for by the petitioners. In so doing it applied a statute passed in 1924 and later incorporated in the Children's Court Act. This statute reads

so far as material

'Whenever a child within the jurisdiction of the court and under the provisions of this Act appears to the court to be in need of medical or surgical care a suitable order may be made for the treatment of such child in its home, in a hospital or other suitable institution, and the reasonable expenses thereof shall be a charge upon the city of New York, but the court may, after a proper hearing, issue an order that the person or persons charged with the liability under the law to support such child, shall pay a part or all the expenses of such treatment in the manner provided in subdivision three of section seven of this Act for the support or partial support of children committed by the court"

In pursuance of the order of the Court, the child was given the necessary medical care and attention, resulting in an improvement of the condition from which the child was suffering and for which the mother refused to permit

any medical care or attention

I he theory upon which this statute is based is in accord with sound public policy. While the child from conception until emancipation is subjected to parental guidance, nevertheless its welfare is so closely associated with the State that it is within the province of the legis lature to pass reasonable laws which have for their objective the true welfare of the child. The care of youth by the State is not new From the days of early Rome and Sparta, down through the Middle Ages, until today the tendency of foreign countries has been not

only compulsory mental but also physical edu-

In addition to the statute above quoted, we also find that Section 21-B of the Public Health Law provides that health officers may examine school children, may promote the spread of information as to causes, nature and prevention of prevalent diseases and the improvement of health, and may take such steps as are necessary to secure prompt and full reports of communicable diseases, and Section 482 of the Penal Law makes it a misdemeanor for any person who wilfully omits, without lawful excuse, to perform a duty by law imposed upon him to furnish food, clothing, shelter or medical attendance to a minor, or to make such payment towards its maintenance as may have been required by the order of a court or magistrate when such minor has been committed to an institution

The law does not impose any onerous or unreasonable obligation upon the parents. In the instant case five physicians had testified as to the necessity for medical treatment, but the mother refused to permit the child to receive the kind of treatment which these doctors had unanimously agreed was necessary for the preservation of the health and life of the child

The decision reached by the Court in this mitter was in accordance with justice, common sense and sound public policy. The President of one of our component County Societies summed up the situation when he said.

"The ruling obviously was the only rational one possible from a medical and sociological standpoint. The mother, a lay person had no scientific or medical knowledge. The five doctors who testified naturally knew more about the necessity of the operation than the mother. She was apparently ignorant of the actualities of the situation and in her ignorance almost lost her son's life. She was laboring under a misappiehension.

\*\* \* The subsequent outcome proved the justification of the Court's decision. It is hoped that this case will set a precedent upon which future similar cases will be decided

"Lay persons with no training such as the highly trained physician of today possesses can hardly be in a position to determine what can and what cannot be done by surgery."

#### ALLEGED NEGLIGENCE IN SKIN GRAFTING OPERATIONS

In this case the plaintiff, a middle-aged woman, was a presser engaged by a laundry. The defendant doctor in this case was called one afternoon by the manager of the laundry and upon his arrival found the plaintiff suffering great pain as a result of a severe burn of the left arm extending across the entire width of the anterior surface of the arm and from the junction of the wrist with the hand to a point about midway between the elbow and shoulder. The skin of this area was a dull grayish white color and hard, and at this time it was impossible to tell how deep the destruction of tissue had extended. The patient was given a one-quarter grain morphine sulphate hypodermic tablet to dissolve under her tongue, the purpose being to alleviate to as great a degree as possible her pain. An unguentine dressing was applied and she was removed at once to the hospital during which time applications of unguentine were given to the burn, and a posterior splint was applied to keep the elbow

About two weeks later all the dead tissue had sloughed away and it was evident to the attending physician that he was dealing with a burn of the fourth degree with a small area in the flexure of the elbow, of fifth degree severity. At this time the dressing was changed to adhesive strapping but the splint was still retained. Approximately one week later diathermy treatments were started by means of a cuff around the arm just below the shoulder and the hand in a vessel of saline solution. These treatments were given daily but occasionally an interval of two or three days was allowed to elapse in order that the temporary soreness in the joints might clear up and that the small areas that had been broken down in the first healed part of the scar, might heal up again. Meanwhile the unhealed portion was dressed daily.

Shortly thereafter the dressing was changed to boric acid treatment. At this time it was evident to the physician that he was not dealing with an ordinary scar, but one that showed definite and unmistakable keloid characteristics. A very small third degree burn just above the edge of the large area had healed very rapidly but examination of that scar showed a definite overgrowth of hard, dense, fibrous tissue, a typical keloid scar.

In spite of the daily treatment which had been given and attempts to keep the scar stretched, the area had gradually flexed from a position of complete extension at the time the splint was discarded to about 45 degree flexion. Every effort was made to have the patient cooperate in keeping the scar stretched

by use of weights in the hand, such as carrying a smal pail of stones or sand while at home, but this advice was met with more or less ridicule and with statements to the effect that she would be better off without the arm, and also that she had a lawyer to look after her interests and to see that she got everything that was coming to her. It was explained, to the patient that if the dense fibrous band in the center of the scar could be removed and new skin made to grow there after transference from some other part of her body, the chances of a useful elbow would be much enhanced. At this time there was about 90 degree motion in the elbow joint, flexion being almost complete but extension lacking about 45 degrees of being complete, due to the bridging of the dense keloid scar across the bend of the elbow.

With the plaintiff's consent the following operation was performed under anesthesia: The upper half of the scar was dissected away from the upper edge of the healthy skin to a point just below the flexure of the elbow, disclosing a little subcicatricial fat at the upper end but none at the lower. By making two parallel linear incisions about one inch on either side of the skin edge, freeing these strips of skin and subcutaneous fat and sliding them toward the center till they met, there suturing them together, and suturing the two incisions in a direction at right angles to their length, it was possible to close the upper three inches of the area without grafting. The remaining defect in the bend of the elbow was filled in by two strips of full thickness skin with a little subcutaneous tissue, about four inches long and an inch and a half wide, one taken from each thigh. The incisions in the thighs were easily approximated by interrupted silkworm sutures and an ointment dressing applied.

A couple of days later, all dressings were removed and the area inspected. The upper part of the wound where the skin edges had been approximated, was healing nicely. The grafts were slightly dark in color and there seemed to be union taking place around the edge except for a small area at the bottom where three sutures had pulled out. The areas on the thighs healed quickly, so that at the time the patient was discharged there was no dressing required on one, and only a small dressing on the other to protect a small crust on the scar. At no time do the nurse's notes on the chart reveal any complaint of pain in the thighs.

After her discharge from the hospital the plaintiff's arm was dressed daily with boric acid ointment and the splinting continued to prevent contracture by the new scar.

Two months later the arm was practically healed. Although the grafts had failed to take, a portion of the subcutaneous tissue had remained and grown, forming a slight cushion between the surface scar and the underlying tendons.

At this time there was about 45 degrees motion in the elbow joint. Then the daily treatments of diathermy, vibration, massage and motion (both active and passive) were started again.

A short time after, the motion in the joint had just about doubled, and was about 90 degrees. Almost complete extension was possible, but flexion was impossible beyond 90 degrees, due to adhesions in the elbow joint. It is interesting to note that at this time the scar was in no way limiting the motion of the joint.

Continued treatments for the next ten days showed no further progress in loosening up the joint adhesions, and the defendant doctor advised the patient to have them forcibly manipulated under anesthesia, to which she agreed.

This operation was performed the next day at which time the operating physician forcibly loosened the adhesions in the elbow joint, obtaining absolutely complete extension and flexion thereby.

The plaintiff left the hospital the next day and reported for daily treatments at the office of the defendant, which treatments consisted of vibration and massages, both active and passive. Complete flexion caused her considerable pain and she subsequently refused to agree to any more treatments of this nature.

Although informed and advised by the physician that with each treatment the pain occasioned by the massages would lessen, the patient never appeared for subsequent treatments.

The next the defendant heard of the patient was when he was served with a summons and complaint alleging negligent treatment of the plaintiff. The defendant denied these allegations of the complaint and the case was noticed for trial and subsequently was tried.

The plaintiff produced two experts whose testimony, however, was entirely unsatisfactory, as they failed to prove that the treatment accorded the plaintiff by the defendant was not in keeping with the proper and approved practice.

At the close of the plaintiff's case the defendant's counsel moved to dismiss the complaint which dismissal was granted without prejudice, thereby terminating the case in favor of the defendant.

#### CLAIMED NEGLIGENT BREAKING OF NEEDLE DURING NOVOCAINE INJECTION

In this case, the plaintiff consulted the defendant, who examined him and found external hemorrhoids and a fissure in ano. An operation was advised, and the doctor put the patient on a table in his office, and proceeded to administer a local anesthesia of novocaine. As the doctor was injecting the fluid into the anal sphincter, the patient suddenly twisted causing the needle to break off at the hilt. The doctor thereupon immediately took steps in an endeavor to remove the needle, but could not find it. He proceeded with the operation as intended, and the recovery from the operation itself was uneventful.

In a few days, the doctor had an x-ray taken of the patient which showed the needle embedded in the buttocks of the patient, and volunteered to have a surgeon remove the needle free of charge. The patient refused this offer, and the needle was subsequently removed by some other surgeon.

About a year thereafter, suit was instituted charging the doctor with negligence in causing the needle to break and remain embedded in the flesh of the plaintiff. The case was noticed for trial, but an order was obtained directing the plaintiff, as a non-resident of New York State, to put up a bond for security for costs. The action was duly dismissed by reason of failure to comply with said order and for want of prosecution, thereby terminating the proceeding in the doctor's favor without trial.

## NEWS NOTES

#### CONFERENCE OF CHAIRMEN OF COMMITTEES OF THE STATE SOCIETY

The first meeting of the Executive Committee of the Medical Society of the State of New York after the Summer vacation time was preceded by a conference of the chairmen of the committees of the Society, called together informally by the President, Dr. W. H. Ross, in order that each one might state the plan for the work of his committee during the coming Winter and Spring.

Legislation: Dr. Harry Aranow, Chairman, stated a principle in medical legislation is that an active offense is the best defense. He said that while the Committee must guard against legislation which is detrimental to public interests, such as cultism and anti-vivisection, the medical profession will strengthen its position by promoting public health bills. The Committee does not originate legislation, but it has charge of that which the officers of the State Society endorse. There was discussion as to what legislative subjects should be taken up this Winter. The following subjects were suggested:

A medical advisor on the State Compensation commission.

Requiring a physical examination of State office holders and employees. (There was opposition to this subject.)

Medical Education and Public Health: Dr. T. P. Farmer, Chairman, outlined the plans of his Committee in two groups of activities. The first group included those activities which the Committee can carry on itself including:

- 1. A continuation of the courses of graduate education. Eight courses are already arranged to be given before 12 county societies.
- 2. The Experiment of a post-graduate clinical day. Syracuse University will provide the teaching team which will conduct an all-day clinical demonstration in Glens Falls, Washington County.
- 3. The preparation of short articles to be published in the JOURNAL. The papers will point out how preventive medicine may be practiced on a person who comes to get treatment for a specific condition. A gall bladder case, for example, is likely to have incipient trouble elsewhere as the result of the original infection.

The second group of activities is composed of those which the county societies would carry out under the stimulation and instruction of the State Committee. These activities include:

- (a) A survey of the county to see what form of medical service is needed; and then to promote it before an outside agency usurps the leadership in providing the service.
- (b) Arousing county societies to stimulate the practice of more preventive medicine by family doctors.
- (c) Better tuberculosis control.
- (d) Active anti-cancer work.
- (e) The collection of news of what other societies and other states are doing.

Public Relations: Dr. J. E. Sadlier, Chairman, presented a written summary of the plans of his Committee, an outline of which is as follows:

- 1. The establishment of friendly relationships with all agencies working in the field of health or curative medicine, including departments of health and voluntary health organizations.
- 2. The stimulation of county societies to form similar contacts in their own counties. Bulletins and letters of information will be sent to county chairmen as in the past.
- 3. Calling a meeting of the chairmen of the County Public Relations Committees on September 18, 1930. It is planned to call the presidents of county societies together during the Winter.
- 4. The development of hospitals by counties.
- 5. Promoting a public health survey of every county to be made by the County Committee. Fifteen have already been made and published in the JOURNAL.
- 6. A study of medical services and health work among the students of the colleges of New York State.
- 7. Giving assistance to county societies in any activity in which public relations are involved, such as the relations of the medical profession to boards of supervisors in promoting the establishment of county departments of health.

Periodic Health Examinations: Dr. C. Ward Crampton, Chairman said that his committee was working along the lines of educating the people to seek, and the doctors to give, periodic health examinations. He planned specifically:

- 1. To form contacts with organizations, such as women's clubs, which would afford opportunities for the committee to do educational work.
- . 2. To stimulate doctors to make the examinations when the opportunities appear.

Physical Therapy Dr Richard Kovacs, Chair man, said that education was the keynote of the work of his committee, which planned the following activities

1 To send lecturers to medical societies

2 Make a survey of hospitals and promote the appointment of a medical min as head of the physical therapy department

3 Sponsor a training course for technicians

4 Prepare post-graduate courses in physical therapy for physicians

5 Promote the instruction of medical students, and admit physicians to the class rooms

6 Ask for legislation for the supervision of technicians

7 Promote physical therapy for workmen's compensation cases

Each chairman answered questions put to him by the others and also by the officers who were present. The discussions were informal and the general conclusions were approved by the Executive Committee which met in the afternoon

#### CONFERENCE OF COUNTY SECRETARIES

The fourth annual Conterence of the Secretaries of the County Medical Societies of New York State was held in the Hotel DeWitt Clinton, Albany, N Y, on Thursday, September 9, 1930, with the following representatives of twenty-one counties present

Albany Delaware	H L Nelms W M Thomson
Dutchess-Putnam	H P Carpenter
Erie	L W Beamis
Genesee	P J DiNatale
Greene	W M Rapp
Herkimer	W B Brooks
Kings	J Steele
Montgomery	W Ř Pierce
New York	D S Dougherty
Oneida	W Hale, Jr
Orleans	R P Munson
Oswego	J J Brennen
Otsego	A H Brownell
Queens	E E Smith
Śaratoga	H L Loop
Schenectady	H E Reynolds
Schoharie	H L Odell
Suffolk	E P Kolb
Tompkins	W G Fish
Ulster	F H Voss
Washington	S J Banker
Wyoming	H S Martin

As with the previous conferences, the counties who were represented had been noted for their activities in the past,—ten representatives having personally attended the conferences of 1926 and 1929 (There was no record of attendance printed in 1927, and no conference was held in 1928) Moreover, the reports of the meetings of sixteen of the counties represented had been printed in the Journal during the year 1929

The Conference was opened at 10 30 o'clock, by Dr D S Dougherty, Secretary of the Medical Society of the State of New York, who introduced Dr Peter Irving, Assistant Secretary of the State Society, as the presiding officer No program for the conference had been announced, but Dr J S Lawrence, Executive Officer of the

State Society, suggested that the subject for discussion should be "How to increase the activities of the Committees of County Medical Societies"

Dr E E Smith, Secretary of the Queens County Medical Society, described the functions of the committees, and named those which do good work and those which are apathetic Dr Dougherty described the functions of the several committees of New York County, with its 3,700 members, and the method of coordinating their activities. He also referred to the attempts to coordinate the work of the five county societies within the limits of Greater New York by means of periodic meetings of the leaders. The larger countries had supported the work heartily

Dr Nelms described the work in Albany County which has 243 members, and mentioned the difficulties the Society has had in Workmen's Compensation cases

Dr W M Rapp, of Green County, said that none of the remarks would apply to Greene County which has 27 practicing physicians, of whom 25 belong to the County Society The doctors are scattered amongst the Catskill mountains. The society holds four meetings a year, and has only two committees,—one on legislation and one on public health and public relations. The physicians consider local problems, but do not seem able to reach a working agreement on any project. Dr. Rapp closed with the remark "We will be glad to hear what the Greene County Medical Society can do"

This remark of Dr Rapp was well received Dr Irving said "Let Greene County get in closer contact with the State Society"

Dr W H Ross, President of the State Society, sud "Dr Rapp's request should be heeded" Dr Dougherty said "We have a field officer to help in this work."

Dr W B Brooks of the Herkimer County Society with 47 members protested against the action of the State Department of Health in sending its representatives into the County and conducting free clinics for the examination of children and the administration of anti-diphtheria

toxin-antitoxin. He said that the county society has an inactive public relations committee.

Dr. Wilber G. Fish of Tompkins County Medical Society with 56 members also protested against free clinics conducted by the State Department of Health.

Dr. Luther Payne, Secretary of the Sullivan County Medical Society, with 35 members, said that his county had forty doctors in the winter and 400 in the summer. He has found that he must rely on the local physicians for public health work. He also praised the work of the public health nurses who work under local committee.

Dr. W. M. Thomson of Delaware County, with 25 members, spoke of the difficulties that the physicians have with the Board of Supervisors, which insists on controlling the public health nurses and

ignoring the requests of the doctors.

Dr. Wilber G. Fish also brought up the question of fees for medical services rendered under the new Welfare Law of the State. It was the prevailing opinion that the law has been in operation for only a short time, but that progress is being made in changing over from a system dominated by local politics to one in which administrative qualifications would be required of the agents.

Dr. D. S. Dougherty said that the lack of harmony between Departments of Health and physicians was not confined to up-State districts, but existed in New York City, where the Commissioner of Health was planning to open free health clinics.

Dr. Alec N. Thomson, of Brooklyn, told of a meeting of representatives of the five county societies of Greater New York, for the purpose of taking action on the request of the Commissioner that each doctor set aside an hour a week for the practice of preventive medicine among young childen at moderate fees; but the Department of Health published the plan before the physicians had acted on it.

Dr. Dougherty introduced the following resolution which was adopted unanimously:—

"The County Secretaries having learned through the press that the Commissioner of Health of New York City, in addresses and interviews, has advised the Medical Profession to abandon what he calls the "Code of Ethics," to publicly advertise and to open one-price clinics, take exception to and condemn this attitude of the Commissioner as subversive of the welfare of the practicing physician and detrimental to the public health.

"They fully recognize that many adopting this method would not do so from methods of altruism or philanthropy but solely with an idea of personal aggrandizement; and that the commercial, the unscrupulous, and the incompetent would foist themselves upon the public at large as being endorsed by the Department of Health and the City authorities.

"Furthermore, those registered physicians of the present advertising type against whom even the Department of Health has been endeavoring to protect the public, would take advantage of this seeming endorsement and entrench themselves more firmly.

"The conference of secretaries believes that the Principles of Professional Conduct are necessary, beneficial, just and equitable, and calls upon the Executive Committee of the State Society to rigidly enforce its provisions, and to confer with the State Grievance Committee regarding the possibility of any violation of the Medical Practice Act."

After a luncheon several officers of the State Society and Chairmen of Committees addressed the secretaries on the particular phases of their work which may be aided by the county societies.

Dr. W. H. Ross, President of the State Medical Society, introduced the following resolution, which was adopted:—

"Whereas, it has become apparent in this conference that in several counties of the State preventive medical measures are being administered by the State, and that those measures would be carried out by the local practitioners of medicine; therefore be it

"Resolved, that this conference of the secretaries of the counties of this State requests that the physicians of each county be given formal opportunity to do all preventive work that they are equipped to do before the State assumes its responsibility for the health of its citizens; and be it further

"Resolved, that this conference of the county secretaries desires to call the attention of every department of the State government having responsibility for any health matters to the fact that organized medicine in New York State provides and supports a committee, known as the Public Relations Committee, for the purpose of conforming the many relationships of medicine to the present day social trends; and be it further

"Resolved, that this conference believes that the individual practitioners of medicine are the final authority in medical matters, and desires to offer its cooperation in public health affairs and expects to be consulted in public health matters. If the profession fails to meet its obligations in this respect in any counties because of apathy, then the conference expects that the State will not allow its citizens to suffer because of it;

"Resolved, that if for any reason the State officials consider their assumption of a new policy or measure to be necessary in any county, they shall consult the Medical Society of the State of New York both as to the necessity of that activity and also as to the means of establishing it."

#### CONFERENCE OF CHAIRMEN OF PUBLIC RELATIONS COMMITTEES OF COUNTY SOCIETIES

The first conference of the chairmen of the Public Relations Committees of the County Medical Society of New York State was held on Thursday, September 18, 1930, in the Hotel Ten Eyck, Albany, at the call of Dr. James E. Sadlier, Chairman of the Committee on Public Relations of the Medical Society of the State of New York. Thirty-one counties were represented, as follows: County Representative

Albany	T. W. Jenkins
Broome	C. I. Longstreet
Chautaugua	H. E. Whellock
Chemung	R. B. Howland
Chenango	F. A. Hammond
Erie	I. C. Gorman
Franklin	J. C. Gorman Charles Trembly
Genesee	S. R. Hare
Tefferson	I. D. Olin
Kings	A. N. Thomson
Lewis	A. N. Thomson P. H. Von Zierolshofen
Monroe	
Nassau	Mr. Louis Nett
Onoida	T H Farrell
Onandago	E. C. Reitenstein
Urange	D. FIRICIL
Orleans	R. P. Munson

	R. B. Todd
m (1 111 1 1 1	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Dr. Sadlier opened the meeting by calling attention to the surveys of the medical and health services which are available in the several counties. Each county committee is expected to make such a survey for three reasons:

- To inform the local doctors of each county about the services which are now being conducted in the county.
- To make the information available to the State Committee.
- To establish a foundation on which future health service may be built.

The State Committee on Public Relations has acted in accordance with the following principles which it recommends to the county committees.

1. The activities of each county committee should consist in expanding the work which is already being undertaken in the county by

- any organization, and also in starting work which is entirely new.
- 2. The members of each county committee shall seek to establish intimate contacts with the leaders of every volunteer health organization in the county. They shall not wait for invitations to cooperate with the lay organizations, but shall take the initiative, if necessary, in proposing cooperation.
- 3. The Committee shall offer the advice and assistance of the medical profession as to the most practical ways of conducting any form of health service in the county, and if possible, shall see that every health organization in the county shall include at least one local physician on its governing body.
- Since the problems of county society practice, like those of private practice, are uniform and universal, the State Committee on Public Relations is in the position to give consultation and advice to any county committee.

Dr. Sadlier called attention to the fact that only fifteen counties had sent surveys to be published in the Journal, and he expressed the hope that other counties would make the surveys for the benefit of the State Society as well as of themselves. This appeal brought a response from the representatives of four counties, including Dr. Ralph Sheldon of Wayne County, who said that he had not understood the importance of the survey, but had thought it to be of local importance only. Moreover, he had thought that the survey was intended to show what the county society had actually accomplished, rather than to diagnose and record the health services which were under way regardless of the results attained.

Dr. Sheldon continued his impromptu address by describing the health services of Wayne County in such a manner that the address would have constituted an excellent survey of his county if it had been recorded stenographically. He brought out the following conditions:

- The Wayne County Medical Society has 40 members, with an attendance of 49 at the meeting last July, and 52 this September.
- The County Society is actively promoting the establishment of a county health department
- It has established cordial relations with the Red Cross after a considerable period of misunderstanding, and now has physicians on the local Board of Managers.
- 4. It has promoted the administration of toxinantitoxin in every town, with the result that 68 per cent of the children of the County have been immunized by the cooperation of

health officers and physicians who have given their services free.

Dr. C. J. Longstreet, of Broome County, said that the conference had revealed clearly what was expected of the Public Relations Committee of his county. He had wondered what he should survey; but when the County Medical Society initiated a campaign for anti-diphtheria immunizations and had appealed to lay health bodies, he had received responses from twenty-nine organizations of whose existence he had scarcely been aware.

Dr. H. B. Smith, of Steuben County, reported that an extensive experiment in the cooperation between doctors and lay organizations is now under way in his county. A county-wide public relations committee, composed of representatives of the health organizations of the county, including the Medical Society, was organized on November 14, 1929, under the auspices of the State Committee on Public Relations. This committee has functioned actively, and has initiated new health activities. It has coordinated the several health activities of the County in such a way that most critics have been satisfied. (It is expected that a description of the committee and its work will be published in the Journal—The Editors.)

Dr. T. H. Cunningham, representing Warren County, with 42,000 population, said that his County Society had accomplished some good work, but it had not made a survey because very little had been crystallized definitely. Yet the more extensively the committee had investigated the more they became aware of health organizations of whose existence they were scarcely aware. Dr. Cunningham then described the following eight conditions in which the County Medical Society was actively involved:

1. Advising the Warren County Public Health Commission.

- 2. Persuading the Tuberculosis Committee to submit its program to the County Medical Society.
- 3. Publishing results of water supplies and securing their chlorination.
- 4. Securing unity of action in promoting a county health department after a series of misunderstandings.
- 5. Establishing a working contact with the Red Cross in the care of children.
- 6. Promoting a round-up of pre-school children and revivifying the Parent-Teachers' Association to do the administrative details.
- Establishing an agreement with the Workmen's Compensation Bureau in regard to fees for operation.
- 8. Promoting a working agreement with the Rotary Club in the care of crippled children.

Drs. D. S. Dougherty of New York County, A. N. Thomson of Kings County, and Carl Boettiger of Queens County, described the public relations work of the several county societies of Greater New York, and showed the essential identity of their problems with those of rural sections.

While the conference was conducted in an informal manner, yet it was remarkable for the manner in which the speakers stuck to their subjects. Twenty-two speakers described conditions in their counties, each being inspired by the previous speakers. The conference was invaluable in promoting an understanding among the county representatives, and between them and the officers of the State Society.

## THIRD DISTRICT BRANCH OF THE MEDICAL SOCIETY OF THE STATE-OF NEW YORK

The first of the District Branches of the Medical Society of the State of New York to hold its annual meeting this Fall was the Third, which met on September 19 in the Assembly Room of the Albany College of Pharmacy, New Scotland Avenue, Albany, N. Y. The President, Dr. Edgar A. Vander Veer, of Albany, called the meeting to order at 10 o'clock. First came the Scientific Program.

Dr. Max Peet, Professor of Surgery, University of Michigan, Ann Arbor, Michigan, gave an address on "Head Injuries," in which he outlined the modern standards of treatment, including the treatment of cerebral hemorrhage, both immediate and remote. Dr. A. J. Bedell, discussing the paper, called attention to the great value of an

ophthalmoscope examination of the eyes for evidence of cerebral bleeding and increased pressure.

"Surgery and Irradiation in the Treatment of Cancer" was the subject of a talk illustrated with lantern slides by Dr. Burlon J. Lee of the Memorial Hospital, New York City.

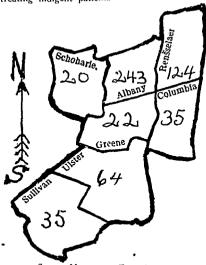

Mr. Clarence E. Ford, Assistant Commissioner, State Welfare Department, explained "The Poor Law and its Relations to the Doctor." He distributed copies of the Public Welfare Law which came into force on April 12, 1929. Reference to Medical Care is contained in Article 10, Sections 83-86. No reference is made to the physician, although hospitals are recognized.

The decision regarding the acceptance of any person as a public charge, either in sickness or

#### THIRD DISTRICT BRANCH COUNTY SOCIETY ACTIVITIES

County	Meetings Reported in Journal in 3 Years	Public Relations Surveys	Graduate Courses in 3 Years	County Tuberculosis Hospitals August, 1930	County Laboratories August, 1930	County Public Health Nurses August, 1930
Albany		+	2	+	0	
Columbia	2		2	+	0	1
Greene	5	+	1		0	1
Rensselaer	2	+		+	0	5
Schoharie	5		2		0	
Sullivan	1	+	3		0	
Ulster	2	+		+	0	

health, rests entirely with the County Public Welfare official. The actual working of the law is not entirely satisfactory to the physician, and Mr l'ord suggested that the Medical Society of each county get in touch with the Welfare Agent and form an agreement regarding the procedure of treating indigent patients.

Sketch Map of the Third District
The figures slow the number of members of the Courty Societies

Mr Ford also called attention to the requirement that the doctor shall obtain the authorization of the Welfare Officer as soon as possible after he is called to a case. Giving authority for treatment is a legal act, and must be based on legil testimony. If a doctor expects the Welfare Officer to pay his bill, he should inform the Wel

fare Officer about the case immediately after the first call

\ buffet luncheon was served at one o'clock in the basement below the Assembly Hall

Dr William H Ross, President of the Medical Society of the State of New York, gave an address along original lines. Instead of speaking of the general policies of the State Society, he exhibited a map and a chart to show the extent to which each county society in the District was carrying out the standard policies of the State Society. He referred to an editorial, signed by himself and printed in the Journal of September first, page 1045, suggesting six standards of measuring the efficiency of county medical societies. These six standards were shown on a chart, as well as the measure of conformity of each county society to them.

While the Third District is next to the smallest of all the districts, in population (566,000), and in the number of doctors (543 members of county societies), yet it ranks high according to the measurements of the chart

The two societies having the least number of members had reported the greatest number of meetings during the past five years, while the society having the largest membership and the most frequent meetings, had not sent a single report of its meetings to the Journal

Dr Ross said that he planned to exhibit a similar chart for every District, and suggested that each one be published in the Journal for the information of all the members of all the county societies

The following officers were chosen

President, H. L. Odel, Chore Springs, First Vice-President, C. G. Rossman, Hudson, Second Vice President, Luther Payne, Liberty, Secretary, W. M. Rapp, Catskill, Treasurer, E. E. Billings, Kingston

These officers were elected for a term of two years, beginning it the close of the next meeting of the House of Delegates of the State Society

health officers and physicians who have given their services free.

Dr. C. J. Longstreet, of Broome County, said that the conference had revealed clearly what was expected of the Public Relations Committee of his county. He had wondered what he should survey; but when the County Medical Society initiated a campaign for anti-diphtheria immunizations and had appealed to lay health bodies, he had received responses from twenty-nine organizations of whose existence he had scarcely been aware.

Dr. H. B. Smith, of Steuben County, reported that an extensive experiment in the cooperation between doctors and lay organizations is now under way in his county. A county-wide public relations committee, composed of representatives of the health organizations of the county, including the Medical Society, was organized on November 14, 1929, under the auspices of the State Committee on Public Relations. This committee has functioned actively, and has initiated new health activities. It has coordinated the several health activities of the County in such a way that most critics have been satisfied. (It is expected that a description of the committee and its work will be published in the Journal—The Editors.)

Dr. T. H. Cunningham, representing Warren County, with 42,000 population, said that his County Society had accomplished some good work, but it had not made a survey because very little had been crystallized definitely. Yet the more extensively the committee had investigated the more they became aware of health organizations of whose existence they were scarcely aware. Dr. Cunningham then described the following eight conditions in which the County Medical Society was actively involved:

1. Advising the Warren County Public Health Commission.

- 2. Persuading the Tuberculosis Committee to submit its program to the County Medical Society.
- 3. Publishing results of water supplies and securing their chlorination.
- 4. Securing unity of action in promoting a county health department after a series of misunderstandings.
- 5. Establishing a working contact with the Red Cross in the care of children.
- Promoting a round-up of pre-school children and revivifying the Parent-Teachers' Association to do the administrative details.
- 7. Establishing an agreement with the Workmen's Compensation Bureau in regard to fees for operation.
- 8. Promoting a working agreement with the Rotary Club in the care of crippled children.

Drs. D. S. Dougherty of New York County, A. N. Thomson of Kings County, and Carl Boettiger of Queens County, described the public relations work of the several county societies of Greater New York, and showed the essential identity of their problems with those of rural sections.

While the conference was conducted in an informal manner, yet it was remarkable for the manner in which the speakers stuck to their subjects. Twenty-two speakers described conditions in their counties, each being inspired by the previous speakers. The conference was invaluable in promoting an understanding among the county representatives, and between them and the officers of the State Society.

## THIRD DISTRICT BRANCH OF THE MEDICAL SOCIETY OF THE STATE-OF NEW YORK

The first of the District Branches of the Medical Society of the State of New York to hold its annual meeting this Fall was the Third, which met on September 19 in the Assembly Room of the Albany College of Pharmacy, New Scotland Avenue, Albany, N. Y. The President, Dr. Edgar A. Vander Veer, of Albany, called the meeting to order at 10 o'clock. First came the Scientific Program.

Dr. Max Peet, Professor of Surgery, University of Michigan, Ann Arbor, Michigan, gave an address on "Head Injuries," in which he outlined the modern standards of treatment, including the treatment of cerebral hemorrhage, both immediate and remote. Dr. A. J. Bedell, discussing the paper, called attention to the great value of an

ophthalmoscope examination of the eyes for evidence of cerebral bleeding and increased pressure.

"Surgery and Irradiation in the Treatment of Cancer" was the subject of a talk illustrated with lantern slides by Dr. Burlon J. Lee of the Memorial Hospital, New York City.

Mr. Clarence E. Ford, Assistant Commissioner, State Welfare Department, explained "The Poor Law and its' Relations to the Doctor." He distributed copies of the Public Welfare Law which came into force on April 12, 1929. Reference to Medical Care is contained in Article 10, Sections 83-86. No reference is made to the physician, although hospitals are recognized.

The decision regarding the acceptance of any person as a public charge, either in sickness or

#### BEAUFORT'S SCALE OF WIND VELOCITIES

Physicians describing the velocity of wind will be interested in the standard scale of the Navy and the Weather Bureau, which is described in an editorial in the New York Sun of September 19, as follows:

"Mariners classify wind velocities according to Beaufort's Scale, which assigning zero to calm, utilizes twelve figures to denote the speed of air movements. Travelers by sea are familiar with it; they see it in the day's run, posted for general information and for the particular enlightenment of investors in pools. Here it is, as the United States Weather Bureau uses it:

-	Wind Velocity i
Numeral	Statute Miles.
0—Calm	Less than 1
1—Light air	
2—Slight breeze	4-7
3-Gentle breeze	8-12
-Moderate breeze	1318
5-Fresh breeze	19—24
6-Strong breeze	
7—High wind	32-38
8—Gale	3946
9-Strong gale	
10-Whole gale	
11—Storm	64—75
12—Hurricane	

"As adapted for use in the Weather Bureau forecast, this classification is condensed. Calm, light air and slight breeze become "light." Gentle,

moderate and fresh retain their original meanings. Strong breeze and high wind are joined as strong. Gale and strong gale are united in gale. Whole gale and storm coalesce into whole gale. Hurricane remains unchanged.

"Foresters cannot always have at hand a wind gauge, yet in fighting fire they must approximate the velocity of the wind. They have assigned values to the numerals of Beaufort's Scale. Their version runs thus:

- 0. Smoke rises vertically.
- 1. Direction of wind shown by smoke drift, but not by wind vanes.
- Wind felt on face; leaves rustle; ordinary vane moved by wind.
- 3. Leaves and twigs in constant motion; winds extend light flag.
- 4. Raises dust and loose paper; small branches are moved.
- 5. Small trees in leaf begin to sway; crested wavelets form on inland waters.
- 6. Large branches in motion; whistling heard in telegraph wires; umbrellas used with difficulty.
- 7. Whole trees in motion; inconvenience felt in walking against the wind.
- 8. Breaks twigs off trees; generally impedes progress.
- 9. Slight structural damage occurs (chimney pots and slate removed).
- 10. Seldom experienced inland; trees uprooted; considerable structural damage occurs.
- 11. Very rarely experienced; accompanied by widespread damage."

#### POPULAR PUBLICITY ON DIPHTHERIA

The following editorial comment from the New York Times of September 22 is an excellent example of appealing popular medical education in the daily newspapers:

More than a million children under 10 years in the entire city have not yet been immunized, but the preventive treatment for 333,000 has reduced the number of cases and the number of deaths each 57 per cent for the first eight months of this year compared with the corresponding period of 1929.

"Mothers and fathers may allow themselves to think that their child must be safe, partly because such a terrible thing as death from diphtheria could not happen, and partly because so many children have been immunized that the danger has already been greatly lessened. But if they have their child's welfare at heart they make cer-

tain of his safety by having the first of the three antitoxin injections made at once.

"Children who were treated last Spring are now immune for life. It takes six months for the antitoxin to develop its full strength in the child's system. Doctors have pointed out that there are no reasonable obstacles in the way of immunization of every child in the city immediately. The treatment is not dangerous nor unpleasant in its after-effects. It is safe, easy to obtain and inexpensive. Most of the 12 000 physicians in the city have agreed to administer the course for \$6. The family doctor, knowing the child and taking an interest in the family, is the man to do the work for most people. For those who cannot afford the fee there are fifty-nine Baby Health Stations where a child may be immunized without charge."

## BOOK REVIEWS

SYMPTOMS OF VISCERAL DISEASE: A Study of the Vegetative Nervous System in Its Relationship to Clinical Medicine. By Francis Marion Pottenger, A.M., M.D. Fourth Edition. Octavo of 426 pages, illustrated. St. Louis, the C. V. Mosby Company, 1930. Cloth, \$7.50.

This work is a successful attempt to show how pathological changes in one organ affect other organs and the organism as a whole through the medium of visceral nerves. The study of the vegetative nervous system furnishes the essential facts to understand the manner in which body activities, both physiologic and pathologic, express themselves.

He shows very clearly the interdependence of the visceral nerves, the endocrine secretion and the ionic content of the body cells. Many clinical conditions are explained as due to alteration in neurocellular mechan-

ism.

In part two the relationship between the vegetative nervous system and the symptoms of visceral diseases is shown.

Under inflammatory diseases he classifies symptoms as follows:

1. Symptoms due to toxemia (general symptoms);

2. Symptoms due to reflex action;

Symptoms due to disease process itself; and may include

4. Symptoms which appear as a result of nervous and endocrine imbalance; e.g., respiratory, circulatory, metabolic and psychic symptoms. The relative stability or excitability of nerve cells of different divisions of the sympathetic and parasympathetic often differ in the same as well as in different individuals in health and in disease.

In part three the author discusses the sympathetic, parasympathetic and spinal reflexes of the different viscera.

That the book has been well received is evidenced by the fact that it has now reached the Fourth Edition, bringing the subject matter up to date and adding a new chapter on "Pharmacologic and Clinical Tests for Sympathicotonia and Parasympathicotonia."

GEORGE I. SCOVNER.

HEMORRHOIDS: The Injection Treatment and Pruritus Ani. By LAWRENCE GOLDBACHER, M.D. Octavo of 205 pages, illustrated. Philadelphia, F. A. Davis Company, 1930. Cloth, \$3.50.

This little monograph is somewhat revolutionary in its ideas. The paper, print and illustrations are excellent. A 5% solution of phenol crystals in Wesson oil is advocated. The author's usual dose is 10 c.c. for large hemorrhoids and pruritus ani. Good results are claimed without ill effect.

claimed without ill effect.

For pruritus ani, the injections are made both within and external to the sphincter.

Henry F. Graham.

THE MECHANISM OF THE LARYNX. By V. E. NEGUS. M.S., London, F.R.C.S., England. Octavo of 528 pages, illustrated. St. Louis, The C. V. Mosby Company, 1929. Cloth, \$13.50.

It is hardly possible in a brief review of this exceptional work to do more than refer to the great number haustive research.

The reader must be impressed with the fact that up to the appearance of this volume relatively little data publication.

The complex mechanism of the larynx in man has been finally established by Negus through his untiring efforts in tracing the development and function of corresponding organs through nearly all the known forms of lower animal life. This necessitated an intimate knowledge of the habits and environment of hundreds of different animals from the very corners of the earth.

As a logical result of his extensive observations many accepted theories and principles were replaced by en-

tirely new and authentic facts.

Information has been gathered from a great amount of material which Negus employed in his studies of comparative embryology and anatomy. This work is most unique and instructive.

Such correlated functions as respiration, olfaction and deglutition are fully explained in the respective chapters.

Consideration of the evolution of the defensive mech-

anism of the larynx is most illuminating.

The wealth of data relative to the mechanism of phonetics will undoubtedly react as a revolutionary influence in the art of voice culture. This should prove of practical value in the correction of certain speech defects.

The usefulness of this monograph will certainly not be limited to laryngologists. Dr. Negus in his modest manner has presented himself as a ranking naturalist. His book is a masterpiece, the product of a labor of love.

HARRY MEYERSBURG.

A TEXTBOOK ON ORTHOPEDIC SURGERY. By WILLIS C. CAMPBELL, M.D., F.A.C.S. Octavo of 705 pages, illustrated. Philadelphia and London, W. B. Saunders Company, 1930. Cloth, \$8.50.

There are some textbooks which the medical public await with eagerness. This favorable anticipation is warranted because of an author's known skill and versatility in practice, because of his reputation as a teacher and because of the value of his previous shorter writings. Such a book is this Textbook on Orthopedic Surgery, by the President-Elect of the American Orthopedic Association.

Hardly could one find a better definition of the subject than Dr. Campbell has given: "Orthopedic Surgery is that branch of general surgery which deals with diseases and injuries of the bones, joints, muscles, fascias and the nervous system which impair function and cause

deformity at any age."

Like the construction engineer, the author builds his subject from the ground upward. Thus, whether in the chapters on examination or in those dealing with description and treatment, the presentation is first of the foot, then of the ankle, the knee, the hip, and so on. In dealing with each condition, this book presents the usual order of definition, description and treatment. It reflects the writer's large experience in choosing between the forms of treatment available. Although himself an operator who has added valuable procedures to the surgery of the reconstruction of disabled and deformed parts of the body, Dr. Campbell herein weighs carefully, in dealing with all of his subjects, the three leading principles of treatment which have given orthopedic surgery the leading place it holds today—support by apparatus, stimulation of function by corrective gymnastics and other forms of physio-therapy and correction of deformity and reconstruction of physical parts by operation.

Because of the orderliness of arrangement of the subjects, the clearness of the style of writing and bringing the known knowledge up to date. Dr. Campbell has made, in this book, a valuable contribution to Orthopedic Surgery.

WALTER TRUSLOW.

OTOLOGIC SURGERY, By SAMUEL J KOFETZKY, M.D., F.A.C.S. Second Edition revised Octavo of 553 pages, illustrated New York, Paul B Hoeber, Inc., 1929 Cloth, \$800

The author has made concise descriptions of opera tions the main topic of his book, as is indeed suggested in the title of the work. It has become to the student and the young operator a sort of cado mecum for re peated reference for perfecting technique of operations on the ear But, fortunately the writer has given a condensed and carefully considered opinion as to his reasons for operating-the indications in other words which would lead the surgeon to operate or to withhold his hand As to the still debated question as to what constitutes a chronic middle ear suppuration or at least one presenting need for mastoid operation simple or radical, the author leans to the opinion such a measure is desirable in (1) a history dating from the exanthamata, in diphtheria (2) middle ear tuberculosis, (3) in children the subject of previous miliutrition, (4) presenting perforations of the membrane tympani extending to and involving the marginal annulus tympanicus or presenting necrotic attenuations or active necrosis of the ossicles, fetid discharge and profound loss of hearing and in cases in which prolonged treatment has failed to bring about a cessation of the discharge from the car

This is an example and one of the most important examples of the methods of the book. The question of whether a mastoid operation is needed why it is needed and the question of the stage in the disease at which to operate are among the very important problems of otology. The number of cases of mastoiditis brought to the otologist in the later and last stages of the disease are now rarely seen. The need of urgency is much less frequent than years ago, when operation for mastoiditis was a new thing. Today the operation may as a rule watch his cases and determine with much greater accuracy than formerly the cases which may progress to cure with other methods than operation upon the mastoid, likewise, to judge when and why a mastoid operation is imperative.

THE HARVEY LECTURES Delivered under the auspices of the Harvey Society of New York Series 24 1928 29 Octavo of 216 pages Baltimore Williams & Wilkins Co. 1930

For the practitioner two of the chapters in this series should be of particular interest

The ever controversial topic of the pathogenesis of tuberculosis is again revived informan and bowne tuberculosis is considered, the theoretical reasons for recommending BCG vaccine are advanced, the rarity of the marital transmission of tuberculosis is discussed as well as the interesting paradox of hypersensitiveness and immunity as evidenced by a positive tuberculin test

Levaditi is convinced that the treponemicidal action of bismuth is superior to other antisyphilitic agents

Other topics include calcium and phosphorus metabolism constitution and disease experimental nephritus, and the nature of ultrafilterable viruses

EMANUEL KRIMSKY

RECENT ADIANCES IN PREVENTIVE MEDICINE By J F C HASLAM MC M D Octivo of 328 pages illustrated Philadelphia P Blakiston's Son & Company, 1930 Cloth, \$3.50

Doctor Haslam as Director of Library Services, London School of Hygiene and Tropical Medicine, has unusual familiarity with the literature of preventive and hygienic medicine. His book is a masterly summarization of the technicalities of his subject, and enumerities more than 400 bibliographical references. The publication will prove a gold mine for the research worker and the physician who desires accurate technical information.

To Doctor Haslam, preventive medicine means more than sanutation. His present work details the relationship of eugenics, maternal and child care, milk, atmospheric conditions industry and immunization to public lightly.

The book contains 30 supporting charts and statistical tables

FREDERIC DAMRAU

Handbook of Bacteriology for Nurses By Harry W Carry, A B M D Third revised and enlarged Edition Octavo of 282 pages illustrated Philadelphia, F A Davis Compuny, 1930 Cloth \$2.25

An excellent presentation of bacteriology for the nurse. The doctor who is a little rusty on bacteriology would find its perusal worth while. The book is simply and clearly written and well illustrated (forty three engravings and one colored plate). There are questions appended to every chapter. May be rated as a standard book of its class.

A C J

Testicular Grafting from Aie to Man Operative Technique Physiological Manifestations, Histological Evolution Statistics By Street Voronoff and George Alexandrescue. Translated by Theodore C Merritt MD Octavo of 125 pages, illustrated London Brentano's Ltd, 1929

In this book Voronoff records his matured views on the subject of testicular grafting, bised upon an experience of 475 cases. Statistics are offered which classify as successes only those cases which have shown persistent physical and mental improvement over a period of five years. Operative technic is discussed physiologic manifestations are described and histologic evolution. A C I

THE MEDICAL MUSEUM Modern Developments Organization and Technical Methods Based on a New System of Visual Teaching By S H DAUKES, O B E, W D Octivo of 183 pages, illustrated London, The Wellcome Foundation, Ltd 1929

This book is not merely a theoretical contribution to the improvement of museums in general and medical museums in particular, but a description of practical achievement based upon theory and vision

The author is precise clear and his obviously devoted much study, skill and care to a subject on which this book stamps him as an expert. Having in the first chapter discussed the functions of a medical museum and made a plea for reform and for a wider outlook, Dr. Daukes proceeds in subsequent chapters to describe and discuss the details of the new system of visual teaching on which the ideal museum is based.

This is followed by appendices dealing with the application and development of the system with types of buildings, walls screens cases libels, illustrations and technical details of preserving

In conclusion there is a very hography of technical museum

page illustrations of screens sections and specimens which are most helpful as providing practical evidence of the soundness and practicability of this new system of visual teaching

The letterpress is in large easily read type and the typography gives an ur of distinction to the publication which is further enhanced by the technical perfection of the photographs of difficult subjects and the high quality of the half tone reproductions

Everyone interested in museums whether in regard to construction development control or use should read and study this book. Having done so there will be a natural desire to see its methods developed in actual practice which fortunitely is possible for all those who can use the Wellcome Museum of Medical Science 33 Gordon Street London England of which Dr Daukes is Director

## OUR NEIGHBORS

#### COMMITTEE ON PUBLIC HEALTH OF MICHIGAN

The September issue of the Journal of the Michigan State Medical Society contains the reports of the committees to be given at the annual meeting. September 15, 16 and 17. The Committee on Public Health makes excuses for its inactivity and says:

"We ask for your indulgence in a certain lack of actual constructive work for the past year, calling attention to the fact that a new chairman and a practically new committee were called upon to act. It has been a somewhat inactive committee for several years, and yet we feel that there is a lot of necessary constructive work that should be given their earnest attention this coming year.

"This committee has usually been closely associated with the State Board of Health in any cooperative movement between that body and the medical fraternity of Michigan. The past year has called for no such action. We have at present a new Commissioner of Health for our State, who may, or may not, feel the necessity of cooperation with us. In case such action should arise, however, we shall be ready to lend any aid that is necessary."

The committee then discusses two questions and proposes to ask the House of Delegates to give it the authority and money to send a questionnaire to each county society asking for an opinion as to how to conduct an examination of pre-school children, and how the societies can carry on a campaign for anti-diphtheria work. The report says: "Our first problem is that of the annual examination of pre-school children or the so-called summer round-up as conceived by the national order of Parent-Teacher Associations which has a strong constituency in the State of Michigan.

"This organization has as one of the principles

of the order, the examination of children of pre-school and school age. As carried out in Michigan, outside of a few communities, the work has been improperly organized, non-constructive due to lack of proper records and follow-up work, and a burden to the local medical men who have been called on for examinations without a clear knowledge of what it's all about.

"Your committee asks that this representative body, the House of Delegates of the Michigan State Medical Society, grant your health committee the necessary permission and expense to carry on a questionnaire investigation and research of this problem."

The questionnaire will inquire about the attitude of the county societies toward the following methods of making the examinations of pre-school children:

- 1. Leave them to family physicians.
- 2. Board of Education to have doctors.
- 3. Volunteer doctors to do the work free in clinics.
- 4. Physicians to make the examinations in their offices at prices to be agreed upon.
- 5. All children bring blank forms to be examined free by family doctors.

The questionnaire about immunizations covers nearly the same points.

The defect in the plan seems to be that the questions are put to physicians who have had little or no experience in the activities, and know little or nothing about them. A better plan might be that the State Committee undertake each method with selected county societies that agree to try them. Then a definite answer could be made,—possibly several answers.

#### HONORING THE LIVING IN MAINE

The following editorial is from the August number of the Maine Medical Journal:

"The Journal plans to introduce from time to time to its readers members from our honorary list—men who have practiced medicine fifty years and more are well worth meeting. We cannot pay too much respect to such lives, and we believe that we should not wait until their course is run to do them honor. Life praise. It is fitting to express to our honorary

members something of the inspiration which we derive from continued association with them.

"The Journal office wishes to have a photograph of every member of the Association—no man knows what the night may bring to pass. You may wake to fame and fortune or you may lie down at eve to everlasting rest. In any case, the Journal would like your pic-

### DETOXIFYING INTESTINAL BACTERIA

WHEN the use of Soricin (purified sodium ricinoleate) as a detoxifying agent was first suggested, Larson of the University of Minnesota opened up an entirely new method of combating infection.

Detoxification with Soricin was applied first in dentistry, where it has afforded brilliant results in the treatment and prevention of oral infection in the mouth. The use of a detoxifying agent in medicine and dentistry is based upon its ability to render pathogenic organisms non-pathogenic, and to detoxify their toxins. This prevents the absorption of toxins from the focus of infection and the consequent development of secondary infections.

Detoxification has been studied by Cesari, Cotoni and others at the Pasteur Institute in Paris, who have reported that their experiments confirm Larson's work. More recent investigation has revealed the

fact that detoxification is as applicable in the treatment of infections of the intestinal tract as it is in the control of mouth infections.

For the past two years Morris, Dorst and others have studied experimentally the use of Soricin in the bowel and have now reported their results fully in current medical literature. Their clinical studies show that Soricin, when given by mouth, affords prompt relief in colitis and a number of other diseases of the intestinal tract. The experimental work so far com-' pleted justifies the further clinical study of this important drug by the medical profession.

If you are interested in the work of these investigators, we would be glad to send you, free of charge, a supply of Soricin, together with complete clinical information. THE WM. S. MERRELL COMPANY, CINCINNATI, U. S. A.

## Performing a Difficult Job

in a most satisfactory way

Designed for relief of scrotal hernia—this garment performs its work better than any belt or truss on the market.

It hugs the body closely, following the groin line. Beneath—a fitted, resilient pad protects the ruptured part. Perineal straps fitting close to the side of the leg hold the pad firmly. No slipping from place. No irritation. The CAMP PATENTED ADJUSTMENT, lacing at back, pulling from lower front, governs tightness and pressure.

A support affording decided comfort to the patient. In different body heights, all sizes. Sold at the better drug and surgical houses.

Write for physician's manual

The Cardiologist's Choice

Pil. Digitalis

(Davies, Rose)

Physiologically tested leaves made into physiologically tested pills.

Convenient, uniform and more accurate than tincture drops.

Prescribe "original bottle of 35 pills" which protects the contents from exposure from the time of manufacture to the time of administration. This further insures dependability of action.

Each pill contains 0.1 gram, the equivalent of about 1½ grains of the leaf, or 15 minims of the tincture. Sample and literature upon request.

ture. Mail it today to the Journal office, 22 Arsenal Street, Portland, Me.

"In this number we present Dr. James Alfred Spalding, of Portland, one of our honorary members, who speaks for himself in a characteristic manner in a sketch entitled 'Some Curious End Results.'

"The sketch referred to was an address by Dr. Spalding before the Maine Medical Association in June, 1930. Dr. Spalding described the end result of his experience with a lady and a man, both of whom came to pay a bill:

"'I spoke to the lady, who wanted to know how much money she should pay me for her account, and I said, "I will take all that you have got." She went with me into the other room and settled the account, but when I walked out with her, Mr. Bartlett had disappeared. Later on, I wrote to him and asked why he did not wait. He wrote and said: "I send you a check for your little bill. I wasn't going to let you have all the money I had got, the way you took it out of that lady."

"Dr. Spalding described an ear case with an unexpected result:

"'A woman consulted me at the Maine General Hospital for a terrible noise behind the ear. She was much distressed and wanted to know if anything could be done for it. More as a joke than anything else, I told her I would give her some ether, drill a hole in the bone, and let the noise out. The operation went off to our perfect satisfaction. She never had any more noise in that ear, and ten years later it had not returned."

## A HEALTH EXAMINATION IN VIRGINIA

The Virginia Medical Monthly for August reprints a very brief article on a Periodic Health Examination, written by H. L. Willett, Jr., Associate Director, Gorgas Memorial Institute, Washington, D. C. The article is one of a series, and reads as follows:

"I have just had my annual health audit and because people constantly ask what that means, I am going to use myself as an illustration. This is what happened.

"I walked into the office for my appointment and gave the doctor my health audit blank, carefully filled out. That included such matters as diet, sleep, exercise, weight, habits—the things he needed to know in order to get an adequate picture of me. There was just one special 'symptom' I wanted to talk about, an occasional lameness. The doctor made a note of it.

"Then I discarded some clothes, lay down on the table. Eyes, teeth, sinuses, ears, throat, lungs, heart—he looked and listened and tapped from top to toe, dictating comments to his secretary. The lameness came in for a good deal of study of how I could bend and twist. Blood pressure, pulse, blood count, urine analysis. Everything was carefully recorded.

"By the time I was dressed the reports were typed and on his desk—the health blank, what I had told him, what he had found, what the laboratory tests showed. Then he analyzed them.

"'Internally sound, no further tests needed. Now about your diet. You'd better—' just a few simple suggestions. 'You don't exercise enough'—and a few more suggestions. 'About your lameness. I'm going to let it go a month. If it troubles you again I will have it x-rayed. But no use incurring that expense unless we have to. Just—' and again a simple explanation of muscles and their care.

"Then came the remark that struck me most.
"'After I've examined you a few times I'll know something about you. Diagnosis on a practical stranger (I only recently moved to Washington and met him) is always difficult. Next year and the next we'll compare your report with this year's. In the meantime watch the diet and exercise, and call me if anything ever seems to be wrong.'

"It took me only ninety-five minutes and now I know that I am still in good shape (yesterday I only thought and hoped so); I know a man to whom to turn in an emergency; I understand better why doctors sometimes hesitate to take responsibility for sick people who are strangers; I know I shall go back next year because the more I see of these health audits, the clearer it becomes that it saves time, trouble and money to have bad symptoms detected before they become chronic or dangerous."

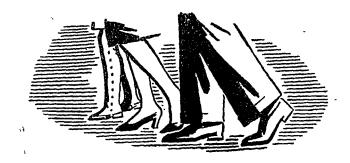

#### FEE SCHEDULE IN MICHIGAN

The Committee on Civic and Industrial Relations of the Michigan State Medical Society, in its annual report, discusses a fee schedule for workmen's compensation work as follows:

"Simultaneously with the recommendation of the Civic and Industrial Relations Committee that an industrial fee schedule for compensation cases be proposed and adopted in this State, the Michigan 'Association of Industrial Physicians and Surgeons, at its annual meeting, also made this same recommendation. Your chairman had a conference with the president of the latter organization, Dr. Gorsline, who has agreed to cooperate with your committee in making an im-

## Who is your Patient?

MAN or woman? Adult or child? A very necessary question when you prescribe a remedy for constipation—unless it is Agarol the original mineral oil and agar-agar emulsion with phenolphthalein. Then you need to give thought only to the dose. And that is simple. Begin with a tablespoonful for adults and a teaspoonful for children, at bedtime. Reduce the dose as improvement takes place.

No excess of mineral oil to make adjustments of the dose necessary. An emulsion as fine as it can be made that mixes thoroughly with the intestinal contents, carries unabsorbable moisture to them and makes evacuation easy and painless.

Besides, it gently stimulates peristalsis, and thereby makes the result certain and reeducation of the bowel function possible.

One tablespoonful at bedtime

—is the dose

Final decision on the true worth of Agarol rests with the physician. We will gladly send a twin package, with literature for trial.

#### OBJECTIVES OF THE FLORIDA MEDI-CAL ASSOCIATION

The June issue of the Journal of the Florida Medical Association contains an editorial by President, Dr. J. C. Davis, of Quincy, which consists, principally of an address given by him at, a health conference held at the call of Governor Doyle Carlton, Dr. Davis first called attention to the economic loss from sickness as follows:

"I believe that the medical profession of the State of Florida realizes its individual and collective responsibilities in the matter of promoting public health. In a state famous for its exposition of the superlative in modern civilization, we should be rid of the waste and

inefficiency due to disease.

"Let us figure for a moment the partial cost to the State of Florida of preventable deaths due to the lack of appropriation of funds for the activities of the State Board of Health for laboratory facilities and the maintenance of additional trained workers in the field. There were 470 deaths in 1929 from malaria, a preventable disease. Thus estimating each life worth \$5,000, we would have a loss of \$2,350,000. Further estimating, there are two hundred cases of malaria for each death and for each case there is an average of five days total disability, considered at a minimum average of \$1.00 per day earning capacity giving us a cost of \$470,000. This amount added to the death cost would give a total of \$2,820,000 for malaria alone. The loss to the state of mothers during childbirth for 1928 was 280. Two thousand deaths of infants under one year and premature births and deaths from injury at birth totalling 669 were also recorded during that year. These figures are appalling when we realize that 50 per cent of these deaths were due to ignorance, negligence or poverty and the majority of cases due to negligence may be properly classed under ignorance. This reveals that much educational work is needed under department of child hygiene, and public health nursing."

The President then set forth the objectives of the State Association as follows:

"First: We must endeavor to educate our state legislators as to the necessity of the appropriation of sufficient funds for the State Board of Health to place as many health units throughout the state as they deem necessary to cope with the situation.

"Second: We should further cooperate by aiding in every way possible the State Board of Health in carrying out its program.

"Third: As an association we should inform our communities as to the vastly improved (Continued on page 1196—adv. xx)

### Doctor:—

## Should your patient prescribe for himself?

If you wish your patient to have the full benefit of your knowledge and 'experience specify by name the brand of Cod Liver Oil you prefer. The clarity and purity of Nason's, its pleasing flavor and high vitamin potency, are your assurance that in every case where Nason's Cod Liver Oil is prescribed, it will please and benefit your patient.

#### High Vitamin Potency + Palatability

The vitamin potency of Nason's Palatable Norwegian Cod Liver Oil is warranted to be not less than 1000 vitamin A units per gram and not less than 150 vitamin D units per gram. Each lot is biologically tested.

Accepted by Council on Pharmacy and Chemistry, A. M. A.

and more beneficial services which our health departments can render adequately supported. This may be done through the columns of the newspapers and magazines, the lecture platform, the pulpit, the school and every other agency of publicity, to spread the propaganda against disease. Fathers and mothers can easily be interested in any campaign in the name of health on behalf of their children. The people should not have the prevailing attitude towards doctors that puts a preminum on disease rather than health, that a doctor is just an expert to be called in an emergency, rather than a promoter of health.

"Fourth: We should cooperate with the health units in conducting physical examinations of the school children. Conducting free clinics for the examination of children before school age, for the treatment of children unable to employ a physician and the removal of physical defects prejudicial to health.

We should educate the laity and "Fifth: again our legislators as to the difference between the well-trained physician and the cults. They should be further taught that no medical or scientific achievement has ever originated with the cults. Many of our preventable deaths are due to patients falling into the hands of the cults until the last ray of hope is gone. This will continue to go on until we can establish laws, as in the Basic Science Act, that will require an examination in the fundamental principles of disease before any school is permitted a license to practice its method of healing. To a layman, a doctor is just a doctor regardless of whether he has had ten years of training or a short course from a mail order house, or a mercenary school teaching only spinal manipulation.

"Let me say in conclusion that if our legislators were endowed with the keen insight and sense of duty to our health program as our Honorable Governor Carlton, there would be no occasion for this meeting here today and this state of ours would be outstanding in health, happiness and prosperity."

## JOURNAL OF THE RHODE ISLAND MEDICAL SOCIETY

The Committee on Publication of the Rhode Island Medical Society made the following report at the annual meeting of the Society on May 21, 1930:

"The scientific and literary policy of this Journal is maintained by the publication of such papers as are read before this and allied societies, when obtainable; and by individual contri-

## NOW Whites COD LIVER OIL CONCENTRATE

formerly COD-LIV-X

gives you for infant feeding, both essential Vitamins A and D, in one palatable wafer, biologically standardized in dosage.

Compare for Potency and Accurate Dosage, (see Fig. i), for Biological tests more rigid than that of the U.S.P. (see Figs. 2 and 3). Then as a prophylactic against respiratory and other infections, as a nutritional supplement, an antirachitic or wherever you would prescribe Cod Liver Oil, test WHITE'S COD LIVER OIL CONCENTRATE—and again compare.

Vitamin D potency of each batch tested by that amount of White's C'LO Concentrate required to produce a continuous linear deposit of calcium salts on the metaphyseal cartilage (epiphyseal border of the metaphysis) of the proximal end of the left tibia, when fed daily for a 10 day period

Each wafer represents not less than 250 vitamin A and 100 vitamin D units According to N N R a tablet made from a C L O Concentrate must contain 200 USP units per tablet or other dosage unit. White's C. L. O. Concentrate wafers are 50 unitshigher than this requirement

Vitamin A potency of each batch determined by the complete healing of xerophthalmia in rats, in addition to the weight gain test required by USP.X

Complimentary graphic weight gain chare with full instructions for mothers gains their cooperation-affords you definite record of results.

## Goes the Blood Pressure

To produce safe, sure and sustained reduction of blood pressure, no single drug can equal a synergistic combination of approved vasodilators.

Such a combination is Natrico, which contains Sodium Nitrite, Potassium Nitrate and Nitroglycerin with the synergist, Crataegus Oxyacantha.

"Very distinct and easily demonstrable service is rendered by Crataegus in atherosclerosis associated with high blood pressure, and in essential hypertension," write Solis-Cohen and Githens (Pharmacotherapeutics, Materia Medica and Drug Action, 1928, p. 1306). "It will not, of itself, lower blood pressure, but it aids in maintaining the lower level brought about by other means."

Actual sphygmomanometer readings attest the value of Pulvoids Natrico in the symptomatic treatment of hypertension.

butions other than these, supplemented by such editorials as may be indicated by the medical and political problems arising in our special environment and upon the horizon of our medical observation. This latter department is supported (presumably) by a board of editors who are each requested to submit six editorials each year. This is a cooperative, supposedly inflexible agreement, and should have the earnest support of all associates, as any deviation from this tends to disrupt our power of self expression, embarrasses the editor, and is not suggestive of good faith.

"Should the contingency of non-operation become definite, it would invite the alternative of doing away with the Board of Editors and editorials, and of the Journal becoming a colorless and voiceless record of purely literary contributions and clippings and would appear a step backward.

"In the more material aspects of our publication, we endeavor to avoid commercialism, carrying sufficient advertising matter only to defray expenses with a reasonable surplus for possible emergencies; this last, through the aggressive and seemingly tireless energy of our business manager, we continue to be able to do. During the year 1929 we received from all sources \$4,355.00, and disbursed (including the \$500 to the Society) \$4,524.00, our bank balance saving us from a deficit.

"We may, however, consider ourselves fairly prosperous and our independent status unaffected."

The remark about "our independent status" probably refers to the suggestion made several years ago, that the New England Medical Journal be made the common organ of the medical societies of all the six states of New England. At present it represents Massachusetts and New Hampshire. The states of Maine and Rhode Island have their own organs, but Vermont and Connecticut do not seem to support any state organ.

#### DISABILITIES TABLE IN WISCONSIN

The Industrial Commission of Wisconsin held four conferences with physicians between March and June, 1930, on the subject of the valuation of typical disabilities. The discussions were full and led to a nearly unanimous opinion among the doctors. While physicians are free to make other estimates, yet the Commission will require evidence that its estimate is inequitable. The table is as follows:

#### ANNUAL MEETING IN PENNSYLVANIA

The eighth annual session of the Medical Society of the State of Pennsylvania will be held in Johnstown, October 6-9, 1930. The scientific program is printed in the August issue of the Pennsylvania Medical Journal and covers ten pages, while that of the New York State Society fills only four pages. One reason for the greater length of the Pennsylvania announcements is the inclusion of an abstract of nearly every paper. These abstracts are unusually well written and informative. For example, the first nmber on the program reads.

"Diphtheria Immunization (15 minutes) Henry J. Benz, Pitts-Outline. Why should burgh we immunize? Diphtheria morbidity and mortality statistics Pennsylvania. Experience gained by massed work. Results given to the medical fraternity and to the public. Methods and material used; Horse serum toxin - antitoxin, serum toxin-antitoxin, and toxoid (Ramon). Results with each of the above as to reactions: Anaphylaxis and final immunity findings by Schick Test. Who is responsible to conduct diphtheria immunization campaigns-private physicians health departments?"

The program committee is making a serious attempt to maintain a time schedule in the sessions, as is shown by the assignment of definite lengths of time for each paper, and of definite hourly periods within which the papers must be given. The following announcement was also printed five times in the program:

"Note—The ringing of the bell, announcing the beginning, the division, and the conclusion of each 55-minute period, is beyond the control of any officer of the Section. Ample warning of this fact, with frequent reference to time allotted, has been given all on the program.

A well known Urological Journal says:

"If you must use a diuretic, try the best —water"

This recommendation is well worthy of adoption especially if

## Itoland Water

is used. Physicians have commented favorably on its bland diuretic properties for over 60 years.

# ANTIPHLOGISTINE

has been recognised as an appropriate adjuvant in Roentgenotherapy. X-rays are considered to be the most useful single therapeutic agent in the hands of the dermatologist for the treatment of Eczema and other persistent Skin Affections, but they may prove disappointing when used to the exclusion of local adjuvants.

A satisfactory application wherever inflammation and congestion are present.

For thirty-six years it has served the Profession faithfully and well.

Antiphlogistine,
by relieving itching
and pain and, at the same
time, softening and soothing
the indurated tissues, is a valuable
agent in skin diseases treated with X-rays.

# THE BATTLE OF THE GERMS

ARMFUL putrefaction in the colon cannot take place under normal conditions, because Nature provides the right soil for the growth of friendly protective germs—notably the B acidophilus and B bifidus

Where putrefaction exists, as evidenced by intestinal flatulency and foul smelling stools, carbohydrate is needed to enable the protective organisms to gain the masters

The ordinary carbohydrates (sugar and starch), however, which form the bulk of our daily food, are not suited to this purpose because they are absorbed in the small intestine

Not so lactose and dextrin, which combined in the form of

# Lacto-Dextrin

(lactose 73%---dextrin 25%)

provides an ideal colon food for promoting the desired change in the intestinal flora

Lacto-Dextrin is a food with a medicinal effect. Its use has been fully described in the scientific presentation, "The Intestinal Flora" Let us send you a copy of this book, together with trial package of Lacto-Dextrin

# Rheumatic Diseases

Arthritis, Sciatica, Lumbago, Neuritis, and Gout Treated Exclusively.

Painstaking diagnosis and therapy as indicated: complete clinical laboratory and department of physiotherapy.

HANNON LODGE is centrally located and fully equipped. Only rheumatic patients accepted. All treatments under careful and constant medical supervision. Reports available to referring physicians, who may at all times retain contact with patients. A completely equipped pathologic laboratory supplements diagnoses and treatments. Specially trained staff. Limited accommodations are carefully restricted. Reservations necessary in advance. Inspection cordially invited.

120 acres of woodland privacy; 800-ft. elevation with 20-mile view. 42 miles from New York. Tastefully furnished and beautifully landscaped. Accommodations to meet the requirements of patients, single rooms or suites.

RUSSELL L. CECIL, M.D.

Medical Director

JOHN Dep. CURRENCE, M.D.
Asst. Medical Director

Snannon Lodge Bernardsville, N.J.

Complete information, rates, treatments, etc., gladly sent upon request to the Medical Director.

PAUL G. ISKE, M.D.
Resident Physician

# Summer Diarrhea

The following formula is submitted as a means of preparing suitable nourishment in intestinal disturbances of infants usually referred to as summer diarrhea:

This mixture contains proteins, carbohydrates and mineral salts in a form readily digestible and available for immediate assimilation.

The need for protein is well understood as is also the value of mineral salts, which play such an important part in all metabolic processes. Carbohydrates are a real necessity, for life cannot be long sustained on a carbohydrate-free diet. It should also be stated that the predominating carbohydrate in the above food mixture is maltose—which is particularly suitable in conditions where rapid assimilation is an outstanding factor.

Further details in relation to this subject and a supply of samples of Mellin's Food sent to physicians upon request.

Mellin's Food Company

Boston, Mass.

# For the Scalp and Skin\_

# EURESOL

Council Acceptea

EURESOL, resorcinolmonoacetate, used in lotions and salves, in acne and dermatitis, but particularly in diseases of the scalp, dandruff, itching, and falling hair.

DOSAGE AND APPLICATION: Applied as a scalp tonic in 2 to 5% alcoholic solution. In other skin diseases it is used as a paint, pure or diluted with acetone, or as a 5 to 50% ointment.

# Not one need suffer

The results already attained in the fight to eradicate diphtheria prove that by applying the scientific knowledge and resources at the command of physicians not one child need die from this dreaded childhood disease—not one need suffer.

The educational work of the campaigns must be continued by physicians. Now, when children are returning to schools—when the Diphtheria Incidence Curve begins its upward climb is the time for immunization of all unprotected children.

In the struggle against disease, the House of Squibb has for many years offered to the medical profession a complete line of biological products, the finest that science, skill and painstaking care have been able to produce. It provides efficient service to Boards of Health and Clinics—serves communities as well as individual physicians.

A booklet giving complete information regarding Squibb Diphtheria Products will be sent upon request—just address Professional Service Department, E. R. Squibb & Sons, 745 Fifth Avenue, New York.

# BRONCHIECTASIS, AN ANALYSIS OF 51 CASES\* By W. W. PRIDDLE, BA., M.D., TORONTO, CANADA

RONCHIECTASIS has long been recognized as a clinical entity. The condition was first noted by Laennect in 1819 who described two cases. In recent years, because of the assistance of lipiodol and of the better understanding of the pathogenesis, bronchiectasis, especially in its milder form, has been much more frequently diagnosed. Certain more or less definite physical findings together with a good history have enabled us to make a clinical diagnosis of bronchiectasis with a reasonable degree of certainty. In selecting this group of 51 cases, those with associated tuberculous lesions have been purposely omitted.

Frequency. Jex-Blake17 (1920) reported the incidence of bronchiectasis in hospital cases as 1.9 per cent. He pointed out that this figure was probably inaccurate due to the difficulty in diagnosing milder forms of the disease and he regarded an estimate of 5 per cent as nearer Lemon19 found dilatation of the bronchi in 4 per cent of all children admitted to the Mayo Clinic from 1920 to 1925. Among the patients on the adult general medical wards of the Buffalo City Hospital during the period of this investigation an average of 7 per cent were definitely diagnosed as suffering from bronchiectasis. This occurrence is relatively high due to the fact that it was taken during the fall and early winter months when the complications of this condition were more prone to occur and brought the patients to the hospital.

Age of Incidence. In a series of over 100 cases reported by Jex-Blake<sup>17</sup> the highest incidence was between 40 and 60 years of age, although many cases occurred between the ages of 10 and 40. Acland<sup>1</sup> found bronchicctasis most frequent during the age period of 10 to 40 with a few cases occurring after the latter age. Osler<sup>22</sup> recorded that it was most frequent between the ages of 20 and 40.

In the group reviewed by Elliott, <sup>12</sup> there were 7 children and 33 adults. An analysis of 51 cases on the service of Dr. Allen Jones showed:

Age of Incidence	Number of Cases	Percentage
10-20	3	5.9
21-30	10	19.6
31-40	5	9.8
41-50	15	29.4
51-60	12	23.5
61- <b>7</b> 0	3	5.9
over 70	3	5.9

Thus the largest number (52.9 per cent) occurred between the fortieth and sixtieth

\* Age of Onset. Riviere,24 Sergent 27 and Pottenger25 have pointed out the frequent onset of bronchiectasis in childhood. Pottenger25 considered bronchiectasis beginning past middle life to be rare unless of tuberculous origin. The following table represents the age of onset in this series:

Age of Onset	Number of Cases	Percentage
under 20	11	21.6
21-50	27	52.9
51 and after	9	17.6
not determined	4	7.8

If the earlier histories of the patients could have been obtained, it is probable that the percentage of cases beginning before the age of 20 (21.6 per cent) would have been much higher. More than half (52.9 per cent) gave a history of onset between the twenty-first and fiftieth year. The nine cases (17.6 per cent) commencing after 50 years of age had an associated occupational fibrosis when observed in hospital.

Sex Incidence. Anderson stated the proportion in his experience was 5 males to 1 female, Jex-Blaker reported 59 per cent of males in the clinical cases and 80 per cent of males in those coming to autopsy. In our

۶

<sup>\*</sup> From the Medical Service of Dr. Allen Jones, Buffalo City Hospital, Buffalo, N. Y.

series, there was an incidence of 41 males and 10 females. This may be partially explained by the associated occupational fibrosis in a number of the male patients, but even omitting these cases, there remained a preponderance of males in the series.

Corrigan<sup>10</sup> (1838) believed Pathogenesis. that cirrhosis of the lung was the cause of A few years later Charcot<sup>9</sup> bronchiectasis. pointed out that bronchiectasis was a sequel of broncho-pneumonia which destroyed the muscular and elastic coats of the bronchi. Around these ideas has grown up the most generally accepted view of the pathogenesis of this disease. However, Sergent<sup>27</sup> recently referred to the teachings of Bard that bronchiectasis was always the result of congenital dilatation which might remain latent for years and that superimposed infection brought this condition into the foreground. There are well recognized, but rarer forms of bronchiectasis that are definitely congenital, the fetal and the atelectatic. In the fetal form the large bronchi and branches show dilatations of cyst formation in their walls or one large cyst communicating with several smaller ones. atelectatic form, the bronchi become gradually widened as a result of developmental defect or collapse of pulmonary parenchyma shortly after birth. Riviere<sup>24</sup> encountered two such cases in his series. It was notable that Lemon<sup>19</sup> had no cases of this kind in his series, of juvenile bronchiectasis.

However, the more common and consequently the more important form is the so-called "acquired type." This appeared to be the end result of a multitude of disease processes in the bronchi, lungs and pleura. For practical purposes the many causes might be summed

up as follows:

# (1) Within the bronchus

- 1. In the lumen: foreign bodies, such as follow tooth extraction and tonsillectomy<sup>17</sup>, <sup>13</sup>, <sup>1</sup>
- 2. In the bronchial wall
  - a. Acute infectious diseases as measles, whooping cough, diphtheria and influenza<sup>19, 24</sup>
  - b. Pneumonia
  - c. Acute and chronic bronchitis
  - d. Syphilitic peri-bronchial fibrosis and stenosis<sup>13</sup>
  - e. Tuberculosis
- (2) External to the bronchus
  - 1. Pulmonary fibrosis (from any cause, notably occupational).
  - 2. Collapse
  - 3. Pleural adhesions, thickened pleura and empyema<sup>13</sup>
  - 4. Pressure on the bronchus, as in aneurysm, neoplasm and diseased glands<sup>17, 13, 1</sup>

An acute condition of bronchiolectasis was described by Carr<sup>6</sup> (1891) which in the experience of Jex-Blake<sup>17</sup> was most common in fatal cases of broncho-pneumonia.

The incidence of bronchial obstruction in cases of bronchiectasis was usually quite high in post mortem cases. Jex-Blake<sup>17</sup> met with this condition 37 times in his series of 105 patients coming to autopsy but this was probably due to the fact that these cases were rapidly fatal. In living subjects, the percentage was less. Elliott<sup>13</sup> encountered only 14.4 per cent in his series. There was no incidence of this type in our group of 51 cases.

Riviere<sup>24</sup> and Sergent<sup>27</sup> were strong advocates of the theory that bronchiectasis was formed on the basis of a juvenile broncho-Riviere21 claimed that it was pneumonia. often possible to detect dilatation of the bronchi following an attack of broncho-pneumonia and to find after subsequent attacks permanent fibrosis and bronchiectasis at the base of the lungs. He believed that many of the so-called broncho-pneumonias in adults were only the exacerbations in a damaged lung of antecedent infection from a previous attack. This indeed appeared to be the etiology in a considerable percentage of cases in our series. Certainly a large majority of the cases in childhood could be traced to the occurrence of an acute pulmonary condition which was followed by chronic bronchitis or to one in which the disease began almost immediately following the acute attack. In a group of children Lemon<sup>10</sup> noted that all cases were of this type, of which 16 per cent followed pneumonia. Riviere<sup>25</sup> found in his study that all but 2 cases were directly traceable to an acute infection of the respiratory tract. In over one third of these, bronchopneumonia, was the exciting cause. Findlay14 reported that all but three cases in his series could be traced to acute pulmonary disease. As has been pointed out by Lord<sup>21</sup> and Boggs<sup>4</sup>, influenzal infections seemed to be the etiological factor in a number of instances. Wargas poisoning has been suggested as another cause and seemed to be the factor in one case observed by Elliott13 and in one of the cases reported in this paper.

Much attention has been paid of late to the part played by accessory sinus disease in the causation of bronchiectasis. Symes<sup>28</sup> and Adams<sup>2</sup> believed that a large percentage of cases were caused by this group of infections. Webb and Gilbert<sup>29</sup> reported 3 cases and stated that they found it to be the etiological factor in a large number of patients. Bilateral empyema of the antra appeared to be the most frequent associated condition. They concluded that if free pus escaped, direct inhalation was a possible route. If there were no drainage of

pus, direct lymphatic absorption might be responsible. Lemon<sup>19</sup> recorded the fact that 32 of his 46 cases gave a history of disease of the ear, nose or throat.

In the 51 cases embodied in this study, the onset could be traced as follows:

Number	of	Per-
Condition Cases		centage
Recent pneumonia	7	13.7
Pneumonia in past history	б	11.8
Influenza	7	13.7
Upper respiratory infections of		
childhood	4	7.8
Chronic bronchitis (including 2 cases

In all the acquired forms, two factors appeared to be at work, (1) infection of the bronchial wall causing a weakening of the supporting structures, (2) some dilating force, whether it was pressure from within as in coughing, traction from without by pleural adhesions, contraction of a fibrosed lung or collapse of the pulmonary parenchyma. These two factors seemed to be present in every case. It has been difficult to produce bronchiectasis experimentally by obstructing the bronchus. In these cases it was believed that dilatation did not accur until the bronchus had first been weakened by the super-imposed infection. When the patient coughed and the intra-pulmonary pressure was raised, the bronchial wall dilated at its most vulnerable spot. However, it was conceivable that in the cases of pulmonary fibrosis the contraction of the intervening fibrous tissue caused primary dilatation of the bronchi by traction. Subsequently secondary bronchial infection completed the lesion of bronchiectasis.

The fact that the bronchi have no complete cartilaginous rings and that the amount of cartilage in each ring gradually diminishes as the branches become smaller might be significant in the pathogenesis.

Pathology. Because of the wide variation of pathological lesions that might lead to bronchiectasis, the associated findings at post mortem were extremely variable. A division into the following types has been made: (1) cylindrical, (2) fusiform, (3) globular, and (4) moniliform or beaded. In the cases in this series that came to autopsy the moniliform type was frequently noted in the milder degrees associated with an occupational fibrosis. The

dilated bronchial tubes themselves in early cases showed very little involvement except for redness and edema of the mucous membrane. On the other hand in the later stages they might be sclerosed and tortuous with greatly thickened walls. In these cases the mucuous membrane was usually pale and moth-eaten in appearance or replaced entirely by fibrous tissue in certain areas. The dilated tubes contained only small quantities of mucopurulent material in milder cases while they were frequently filled with thick pus in the more advanced lesions. The microscopic examination of tissue from this series of cases demonstrated that the surrounding pulmonary parenchyma might be either comparatively healthy, the seat of active infection, or even markedly fibrosed. Few or many divisions of the bronchi were affected, in a few cases the involvement being quite diffuse. In some instances the disease was observed to be limited to one lobe; in others it was unilateral or bilateral in its distribution. The dilatation of the small bronchi in some cases was so extensive as to give a honey-combed appearance.

Pleural adhesions were present in the large majority of cases particularly over the site of the lesions. Pleurisy was noted in eight of the nine cases coming to autopsy. Amyloid disease was met with occasionally in long standing cases as was noted by Jex-Blake<sup>17</sup> in six of 103 autopsies on patients with bronchiectasis.

Situation of Lesion in the Lung. The situation of the lesion was of considerable significance in the diagnosis of bronchiectasis and for this reason has been considered separately. Jex-Blake17 in 108 autopies found the disease to be bilateral in 47 cases, all the lobes being involved in 18 instances. The left lower lobe was the most frequent site of the disease but the right lower lobe was quite commonly affected. Findlay16 found that the left lower lobe was the seat of the disease in children 16 times in 25 cases. Elliott13 observed lower lobe involvement in all patients and in many the lesion was in the upper lobes as well. In the 51 cases reported in this study the location was as follows:

Ni	umber of	Per-
Situation	Cases	centage
Both lower lobes	. 20	39.1
Both lower lobes (more in left	) 11	21 5
Both lower lobes (more in right)	. 8	15.6
Both lower and right middle lobes	. 1	2.0
Left upper and left lower lobe	s l	2.0
Both upper and left lower lober (mostly right upper)	S	2.0

Right middle lobe	1	2.0 2.0 7.8
Diffuse (more in right upper lobe)	1	2.0
Diffuse (more in right lower lobe)	1	2.0
Diffuse (more in left lower lobe)	1	2.0

Although bronchiectasis might be present anywhere in the bronchial tree it was more often basal. As has been pointed out by Riviere,<sup>25</sup> in those cases having their origin in the damaged lung following broncho-pneumonia, it was possible for the lesion to occur in any place which had been the seat of a primary infection.

With a careful history, the pa-Diagnosis. tient's complaints could often be traced back to an acute pulmonary infection, frequently Following this acute broncho-pneumonia. disease the symptoms of cough and frequent expectoration did not clear up as usual, but persisted as a tenacious bronchitis. Histories were frequent in which acute episodes occurred from time to time simulating a milder form Riviere<sup>24</sup> pointed out of the original disease. that it was often possible to trace the clinical findings in a patient through several attacks of broncho-pneumonia until permanent fibrosis and bronchiectasis had developed. these attacks the patient might feel well but the signs elicited over the damaged lung tissue did not entirely disappear. If a proper history were not obtained when the patient was first seen, the diagnosis might be obscured and the condition frequently called pulmonary tuberculosis.

In the cases due to obstruction by a foreign body a history such as tonsillectomy or tooth extraction was important in drawing the physician's attention to the pathological condition present. The history of the complaint was often much longer than that given in tuberculosis and dated to childhood in many instances. With symptoms beginning in middle life one should look for a history pointing to occupational fibrosis. This was-encountered in 9 instances.

The symptoms varied widely in regard to, (1) the nature and extent of the lesion, (2) the adequacy of the drainage, and (3) the severity of the superimposed infection. Often the patients were seen for the first time during one of the complications of the disease. Thus eleven cases were seen in an attack of bronchopneumonia. It was only by means of a good history and subsequent study of the acute attack that the diagnosis could be established. Except for these acute episodes, providing the

lesion was draining well, they gave no history of toxicity such as might be evidenced by night sweats, chills and fever, tachycardia and marked loss of weight. They felt quite well and lived a moderately active life. There was no appreciable loss of weight in 24 per cent of the cases reported. In the more toxic cases comprising 14 per cent of this group, the loss of weight varied from 15 to 40 lbs. over a period of 6 weeks to 10 years. Only six of the non-fatal cases gave a history of night sweats.

The most common complaints were cough The patient frequently and expectoration. stated that he had suffered from these complaints for years but that only recently the sputum had become profuse. Often the cough preceded for some time the onset of expectoration but not infrequently they appeared together, following an acute pulmonary infection. In 43 cases the average duration of the cough was six years and five months. In two instances there was no history of cough and in six others the history was indefinite on this point. In 23 cases cough and expectoration began simultaneously. In others these symptoms started insidiously later in the course of the disease or rather suddenly as an acute attack which caused the patient to seek medical aid. The cough was typically spasmodic occurring usually in the morning after a restful sleep and resulting in expectoration of most of the sputum. However, it might persist throughout the day and even be sufficiently severe to keep the patient awake during the night. A large amount of fetid sputum has been a prominent symptom in textbook descriptions of bronchiectasis. As has been pointed out by Riviere,24 by Sergent,27 and by Lemon,18 the sputum is not necessarily large in amount or malodorous and may be either mucoid, mucopurulent or hemorrhagic. Only six of 35 cases reported by Elliott<sup>13</sup> had fetid expectoration. The average amount of sputum was one to three ounces in 24 hours and in 2 cases, there was none. In our group a fetid odor from the sputum was noted in 15 cases and the average amount was from two to four ounces per day.

Hemoptysis as a symptom of bronchiectasis has been rightly much stressed of recent years as it was formerly believed to be almost pathognomic of tuberculosis. Osler<sup>22</sup> reported a 17 per cent and Jex-Blake<sup>17</sup> a 90 per cent incidence in post-mortem cases. Burrell<sup>5</sup> noted 29 per cent with hemoptysis of a pint or more of blood, 20 per cent with two to six ounces and 32 per cent with blood-streaked sputum. Elliott<sup>18</sup> reported pulmonary bleeding in 12 of 35 cases. In our series, 12 cases gave a history of hemoptysis, the largest amount being four

ounces which was repeated several times Henderson<sup>16</sup> reported a case of the so called dry type of bronchicctasis in which 18 hem-

orrhages occurred

Dyspnœa was not a prominent symptom and when present usually indicated the existence It occurred in 18 cases of of a complication our series. In 10 per cent of these occupational fibrosis was a complication Dyspnœa was present in seven of the patients who died from the effects of the disease and in one with an advanced lesion Cyanosis was noted only in the late and subsequently fatal cases Pain in the chest was a very common complaint Pleurisy was most frequent over the site of the lesion and was often of assistance in directing the physician's attention to that area of the chest Pleurisy was present in 41 of the cases reported

The temperature in patients with a moderate degree of bronchicetasis was quite noteworthy It remained normal or had only an occasional rise to 99 or 100 degrees in cases with marked symptoms and abnormal signs. However, in those that did not drain well, the temperature was higher and this was also true of more advanced cases and those with complications. The pulse and respiratory rate in patients with uncomplicated lesions and good drainage remained approximately normal. The average hemoglobin estimate in this series was 77 per cent. The average leukocyte count in uncomplicated cases was 9,930 with 73 per cent of polymorphonuclear leukocytes.

Examination of the sputim was of great importance to eliminate a diagnosis of tuber-culosis. Repeated examination proved negative in all our cases in which sputim was obtainable. In those in which the sputim was a amined for other bacteria, the one significant point was the wide variety of organisms found

Clubbing of the fingers was a frequent finding especially in the cases of longer duration. With the exception of lung abscess, which is a much less common disease, clubbing of the fingers was most frequent in bronchiectasis. This was noted in 27 cases and probably was present in a larger number. Except in well advanced cases, the patient was usually well.

nourished and did not appear ill

The physical signs in the chest were mostly basal. When the dilated tubes were empty, the findings varied considerably from those when they were filled. The persistence of pathological changes in the same area was most important. On inspection, diminished excursion of the affected side was seen in some cases. Lemon¹o stated that in children with much pleural involvement a curvature of the spine towards the affected side might occur. On percussion slightly impaired resonance was most frequently encountered. Occa

sionally the percussion note was dull if the tubes contained much fluid. The mediastinum was sometimes displaced to the affected side in long standing lesions. On auscultation in uncomplicated cases the breath sounds were frequently diminished and rarely bronchial in character The presence of medium and coarse rales heard over a certain area of the chest, usually basal, was the most constant finding These varied considerably in the same patient and at times were absent They were often heard only after the patient coughed A pleuial rub in the same area was frequently noted Medium and coarse moist rales were heard at some time during the patient's stay in the hospital, in 49 of the 51 cases

In 47 cases, the clinical diagnosis of bronchiectasis was made from the history and physical examination alone, in one other case the diagnosis was suspected. Four patients who previously had been diagnosed as suffering from pulmonary tuberculosis in spite of repeated negative bacteriological reports proved to be bronchiectasis. The diagnosis in one

of these was confirmed at necropsy

Bronchoscopic examination by the technique of Chevalier Jackson was a valuable aid in diagnosis. It was especially useful in climinating the presence of foreign bodies strictures and obstructions from any cause. By this method the extent and location of the trouble and the patency of the affected bronchus could be determined.

Roentgenography as in any chest condition was a real aid but could only be used in conjunction with the clinical findings Elliottial Elliottial great stress on the value of stereoscopic roentgenography in diagnosis Lemon<sup>19</sup> reported that in his group of cases, 29 plates out of 71 showed evidence of bronchiectasis. In this series the r-ray department made a positive diagnosis in 64 per cent of cases

As has been pointed out by Sergent<sup>27</sup> the absolute diagnosis of bronchiectasis can only be made by the use of lipiodol injection. However, this should only be used after the abovementioned methods have been carefully considered. Lipiodol not only aided in diagnosis but gave an accurate picture of the nature and

extent of the lesion

Complications The most common complications of bronchiectasis noted in the litera ture were broncho pnemonia chronic fibrous pleurisy, pulmonary abscess and gangrene empyema, cerebral abscess and less frequently septic pericarditis meningitis chronic arthritis and amyloid disease Lemonia found cyidence of renal disturbance in a large percentage of cases in children

Patients with bronchiectasis were particularly prone to all infections of the respiratory tract and attacks of bronchitis were fre

the most serious complication. There were 10 instances reported by Lemon<sup>19</sup> in 63 cases of bronchiectasis occurring in children. the series of Jex-Blake17 broncho-pneumonia accounted for death in 31 per cent of the patients. In our group, 10 cases were complicated by broncho-pneumonia, three of which proved fatal. Lung abscess has been a much dreaded complication because of its high mortality. Jex-Blake17 recorded three such instances and five of gangrene of the lung. It was present in two of the cases in our series and was suspected as a complication in other patients on the service in which it was impossible to demonstrate bronchiectasis clinically. Empyema was noted by Jex-Blake<sup>17</sup> in 17 patients. We found it in one case which rapidly proved fatal, in spite of surgical intervention. Cerebral abscess has long been stressed as a complication. This was encountered by Jex-Blake<sup>17</sup> in 15 instances. He also reported one case of meningitis. In our series, meningitis complicated by broncho-pneumonia was present in one patient to which no other cause could be assigned at necropsy. Chronic fibrous pleurisy was found in 4 of our cases. Three others had rather marked arthritis dating from sometime after the beginning of the bronchiectasis.

Lemon<sup>20</sup> has demonstrated in Prophylaxis. dogs how the aspiration that occurs during anesthesia can be lessened by keeping the patient in the Trendelburg position. It has been suggested by Riviere<sup>25</sup> that aspiration might similarly occur when the protective mechanism breaks down in severe illness, delirium and alcoholic intoxication and particularly when the patient vomits. Prevention lies in keeping the patient's head lowered under such conditions. This is especially important in patients with an already damaged lung in which added infection is to be feared. Care in avoiding aspiration in tooth extraction and in tonsillectomy would eliminate some instances of the disease. In patients who are known to have a damaged lung as from a previous attack of broncho-pneumonia or pleurisy every possible effort should be made to protect them from the possibility of a further infection. Infection of the upper respiratory tract such as sinus disease and oral sepsis should be eliminated.

Medical Treatment. When the pathological lesion of bronchiectasis was definitely established, the patient could not be permanently cured by medical measures but his symptoms might be alleviated so that he could carry on a useful life.

In our experience, postural drainage was a simple and important method that could not be too strongly emphasized. Good results

quently encountered. Broncho-pneumonia waswere obtained if the patient cooperated in every detail. When advanced cases were encountered and the bronchi were continually filled with secretions, the cavities were gradually emptied by posture until the patient was able to lie flat. As soon as the condition of the patient allowed he was instructed each time he coughed to assume the position in which his cavities emptied best and attempt to empty them completely. When patients were out of bed a convenient posture consisted in leaning over a chair and expectorating the secretions into a container on the floor. Schaefer<sup>26</sup> recommended in localized lesions of the base of the lung that the patient remain in the horizontal posture two hours after the usual morning expectoration. When he became accustomed to this position, the foot of the bed was elevated. This method has been used in our service with apparent benefit in Burrell,<sup>5</sup> in children. recomsome cases. mended expectorants and an occasional emetic as an aid in the drainage of the cavities.

The bronchoscope has been very useful in the field of treatment. Foreign bodies and obstruction from stricture or granulation could be removed by bronchoscopic methods. Weekly bronchoscopic drainage caused some patients who did not improve with postural drainage to show marked improvement. Eight of this series were treated by bronchoscopic drainage. Of these, I died two weeks later from cardiac decompensation. The other 7 all showed improvement which was marked in 3 cases. Two of these with a moderate degree of bronchiectasis were discharged with cessation of expectoration. The other was extremely toxic on general treatment and appeared so weak that he was considered dangerously ill. With the beginning of bronchoscopic drainage he showed a steady improvement, gained in weight and was walking about the ward raising but three ounces of sputum each Yankauer30 reported good results by irrigation with normal saline solution through a specially constructed bronchoscope.

The English School as represented by Acland,1 Burrell,5 Jex-Blake17 and Riviere25 laid great stress on the value of inhalation of creosote vapors. They believed that the fetidity was rapidly diminished and the amount of sputum much reduced. There has been little in the American literature on this subject. The procedure was described by Chaplin8 in 1895. Creosote in capsules has long been recommended in the hope that the excretion of the drug through the lungs would be of benefit. The practical value of this is questionable.

Davies11 suggested the frequent use of mouth washes and nasal antiseptics in patients who expectorate large quantities of sputum as a prophylaxis against the sinusitis and glossitis that are prone to occur.

Surgical Treatment When the above measures have failed to give relief, more radical procedures must be considered Little will be said here as to the surgical treatment of bronchiectasis and reference is made to the excellent articles of such men as Guibal, Archibald and Sauerbruch Edwards12 has made a survey of the possibilities of surgery in The principles of surgical bronchiectasis treatment were well outlined by Riviere25 as follows: (1) improve the drainage, (2) close suppurating cavities, (3) extirpate diseased areas. The methods mentioned were. (1) pneumotomy, (2) pneumothorax, (3) phrenic evulsion, (4) thorocoplasty, (5) lobectomy

Attention has been called to the necessity of early diagnosis if much benefit is to be expected even from these radical measures. Artificial pneumothorax, the only one of these methods attempted on the medical wards, was of use in early cases only and in order to avoid the possibility of pyopneumothorax was restricted to those in which the lesion was well removed from the periphery of the lung. A consideration of the pathology will indicate how useless it is to attempt such a procedure when the disease is complicated by pleural adhesions or by bronchial and peribronchial fibrosis. One case in this group treated by pneumothorax was only slightly improved

Summary 1 Bronchiectasis was diagnosed at the time of this investigation in 7.1 per cent of all cases on the adult medical wards of the Buffalo City Hospital.

2. The greatest number of instances occurred

between 40 and 60 years of age

3. The onset occurred under 20 years of age in 21 5 per cent of cases and after fiftieth year in 179 per cent of the patients.

4. Males were affected 4 1 times as frequently

5 In a large percentage of cases the disease commenced after attacks of acute pulmonary infection in childhood. Certain instances followed pulmonary fibrosis, chronic respiratory infections and war gas poisoning The two most important factors in the production of the lesson were (a) infection of the bronchial wall weakening the supporting structures, (b) some dilating force, either pressure from within as in coughing, or traction from without the bronchus such as produced by pleural adhesions and pulmonary fibrosis

6. There was a wide variation in the type of lesion found in the bronchus and in the surrounding pulmonary parenchyma The lesions were usually basal and more frequently on the left.

7. A history of previous pulmonary infection and occupational fibrosis was of importance in the diagnosis. An analysis has been made of the usual symptoms.

8. Medium and coarse moist râles heard over an area at the base of the lung, frequently only after the patient had coughed, were the most constant signs noted Bronchoscopic examination, roetgenography and lipiodol injection have been discussed. In 47 cases clinical diagnosis was made by the history and physical findings alone.

The most common complications were broncho-pneumonia, chronic fibrous pleurisy and pulmonary abscess, less commonly empyema,

meningitis and arthritis

10 Prevention of aspiration during anesthesia, care in tooth extraction and tonsillectomy and avoidance of infection in patients with damaged lungs have been stressed

11. Postural drainage and bronchoscopic drainage have given good results in the treat-

ment of the disease in our experience

# A SIMPLE DIETETIC SYSTEM FOR USE IN METABOLIC DISORDERS By I. JESSE LEVY, M.D., NEW YORK, N. Y.

From the metabolic service of the City Hospital and the Medical Service of Sydenham Hospital, New York.

ment of patients with metabolic disturbances is widely recognized. In diabetes it is considered indispensable. In the metabolic disorders incident upon cardiac decompensation, particularly with edema, in the nephritides and nephroses, and in obesity, its value is equally great, but has been generally less well appreciated. This has resulted in a deplorable tendency toward vague injunctions to the patient against particular foods, or slipshod suggestions of diets which cover a wide range of caloric content and distribution of foodstuffs. Dietetic management of this type is valueless to the patient and misleading to the physician.

The chief desiderata in the construction of metabolic diets are known caloric content and distribution of carbohydrate, protein, and fat, and in some cases known fluid or salt content. The construction of such diets is not easy. Even in the hospital, with special kitchens and the assistance of trained dietitians, numerous sources of error appear. Without constant vigilance and thorough administrative organization no reliability may be attached to the diets. In the home the difficulties are much greater, dependent as they are on the intelligence and cooperative faculties of the patient and his household.

To meet these needs the author devised many years ago a simple system for constructing diets which has been in constant use in office practice and hospital follow-up for ten years, with the most satisfactory results. It is based on a Key Chart (Table I) in which similar foods have been grouped so that varying quantities have similar distribution of protein, carbohydrate and fat. From this chart, diets of any caloric value or any desired distribution of foodstuffs may be derived. The manner in which this is done will be shown by illustrations given below.

In hospital practice the food is weighed for greater accuracy. At home, household measures are substituted. Because of the variability of the latter, it is best to use standard household measures such as are now readily purchased in five and ten cent stores.

# Salt-Free\_List

Fruits: oranges—apples—grapefruit.

Cereals: oatmeal—farina—shredded wheat—puffed rice.

Cream: sweet. Butter: sweet.

Sugar. Eggs.

Bread: salt free. Fresh vegetables.

Nuts: peanuts—fresh walnuts.

#### Purin-Free List

Milk, eggs, butter, cheese, white bread, cereals, cornstarch, cooked green vegetables, sugar, maple-syrup, jams, fruits.

### Diabetic Diets

Diets to meet any requirement of diabetic patients may be constructed from the Key Chart (Table 1), supplemented by special recipes. Several illustrations are given below. The accuracy of these diets has been tested by repeated clinical trial. In cases in which the carbohydrate toleration is closely limited, slight changes in the diet, such as the addition of 10 grams of carbohydrate produce the expected change in the urinary sugar. The errors which might arise from the use of household measures or from minor variations in values of the articles of food placed in the same group, are consequently negligible. These diets are also being used with perfect assurance of safety in cases which require insulin.

Typical illustrations are given below. These are a 40-gram carbohydrate diet with equal distribution of carbohydrate (Table 2), a 70-gram

carbohydrate diet with equal division (Table 3) and unequal division for use with insulin in cases in which only two injections daily are desired (Table 4). For this purpose the noon-day meal is limited to 10 grams of carbohydrate. Other combinations may be arranged with equal facility.

## Nephritic Diets

In the nephritides and nephroses control of the protein intake is as important as control of the carbohydrate intake in diabetes. It is generally necessary to give diets in which the protein content is accurately measured. The amount of protein allowed is determined by the protein toleration. This is ascertained in the same manner as the determination of the carbohydrate tolerance in diabetics. The index of the limit of protein tolerance is elevation of the blood nitrogen. Protein toleration differs from glucose toleration, however, in one important respect. Unlike the blood sugar the blood nitrogen level does not become stabilized for several days after changes in the protein intake.

In studies of protein toleration and in treatment of nephritics, "low protein" diets are very often employed, but I have found them entirely unsatisfactory. It is absolutely essential to know the exact amount of protein in the diet. Further-

TOTAL	66	68	147	1859

more it should be emphasized that not all cases of nephritis require limitation of the protein. The error of using a low protein diet when there is no disturbance of nitrogen metabolism is to be deprecated as much as the indiscriminate use of unmeasured diets.

- 1. Nephritic Milk: It is often desirable to use a liquid diet in cases in which the protein toleration is very low. For this purpose I employ a milk preparation from which the casein has been removed by coagulation with junket. The recipe for this "nephratic milk" is given in the special recipes. The caloric value of this diet is increased by the addition of lactose. glasses per day with 25 grams of lactose added to each glass supply 1,530 calories divided as follows: Protein, 18 grams, carbohydrate, 216 grams; fat, 66 grams. The caloric value may be further increased by addition of cream. Smaller quantities of this preparation may also be used to supplement other low protein diets. I have found nephritic milk invaluable in the treatment of cases with nitrogen retention incident upon true kidney insufficiency.
- 2. 25-Gram Protein Diet: This diet is employed in the treatment of cases of nitrogen retention due to glomerulonephritis or other renal

- or extra-renal causes. It is very often effective in reducing the blood nitrogen level when socalled "low protein" diets have failed. This is so generally true that recently this diet has been used as a diagnostic test of kidney function.
- 3. 80-Gram Protein Diet: This diet is employed when the protein tolerance is fairly good Similar diets with lower or higher protein content may also be devised. For study of renal function a 100-gram protein diet or even higher may be used.
- 4. Salt-Free Diet: The salt-free diet has great value in the treatment of some types of edema. notably when due to cardiac decompensation. It must be prepared from a restricted selection of foods which contain a minimum of salt. The "salt-poor" diets which are in general use, very often fail to accomplish the desired results When salt-free diets are substituted, clinical improvement is often immediate. Apparently, the efficiency of the diet depends upon the thoroughness with which salt has been eliminated from the In order to accomplish this purpose, saltfree bread and butter must be substituted for ordinary bread and butter. Fresh vegetables or canned vegetables which have been boiled three times to remove the salt, must be used Cream is

# Obesity Diets

The essential requisites of diets for use in reduction of weight are low caloric value and sufficient protein intake. Theoretical considerations place the latter at 2/3 of a gram of protein per kilogram of body weight. From 50 to 80 grams of protein fulfill all possible re-

quirements. The higher figure is probably more desirable.

Several precautionary measures are deserving of special consideration. In diabetic diets only group No. 1 or group No. 2 vegetables and group No. 1 fruits are employed. The other vegetables may be substituted in reduced portions but the

Diabetic Bakery in New York City. Only one preparation of gluten bread is used because of the variability of carbohydrate content in different brands. Gluten bread is also of value in the low caloric diet used for reduction of weight, because of its high protein content. Salt-free bread is supplied by the Cushman Bakeries in New York City.

Special recipes should be resorted to only after the patient has become accustomed to the use of the diet list. The diabetic desserts add variety to the diets. The nephritic desserts are devised to add caloric value without increasing the protein content.

# Special Recipes for Diabetic Diets

1. Diabetic Custard:

1 egg.

1/4 gr. saccharine.

Salt.

½ cup water.

½ cup cream (8 tbsp.).

1/4 tsp. vanilla or almond flavoring.\* (Virginia Dare).

Beat egg slightly, add saccharine and very little salt. Heat cream and water to the scalding point and add slowly to eggs. Strain into 3 small custard cups, dividing the mixture equally. Each portion may be flavored differently.

Value: Each cup or 1/3 recipe. Protein 4, carbohydrate 2, fat 15, calories 159.

- 2. D-Zerta Jelly (plain): Dissolve contents of 1 envelope of D-Zerta; in 1/2 measuring cup (8 tbsp.) of boiling water. Stir well and set away to cool. Value: Protein 2, carbohydrate 0, fat 0, calories 8.
- 3. D-Zerta: Dissolve contents of 1 envelope of orange D-Zerta in 1/2 measuring cup of boiling water (8 tbsp.). Stir until entirely dissolved. Set in cool place. When jelly begins to set, fold in 2 tablespoons of whipped cream. Allow to harden.

Value: Protein 3, carbohydrate 1, fat 10, calories 102.

4. Snow Pudding: Dissolve 1 envelope of lemon D-Zerta in 1/2 measuring cup of boiling water (8 tbsp.). When cold and still liquid, whip with a small revolving beater to the consistency of whipped cream, folding in 2 beaten egg whites, and let stand until firm.

Protein 10, carbohydrate 0, fat 0, Value: calories 40.

5. Almond Cake:

3 eggs.

4 thsp. brown almonds, ground (10 almonds to 1 tbsp.).

Pinch salt and baking powder.

Virginia Dare flavoring.

Separate eggs. Beat yolks with nuts. Add powder and flavoring. Lastly, fold in stiffly beaten whites. Bake in slow oven.

Value: ¼ cake, protein 8, carbohydrate 3,

fat 16, calories 188.

6. Lister's Diabetic Bread:

1 box Lister's flour. Value: Protein 32, Carb. 0, fat 0.3, calories 131.

1/4 tsp. salt.

Separate the yolks from the whites of the Add salt to whites and beat with egg beater until stiff. Beat the yolks with an egg beater until thick and lemon colored. Mix beaten egg whites and beaten yolks together for 1 minute. Fold flour in the beaten eggs (to fold, sprinkle or shake the flour), 1/4 box at a time over the beaten eggs. Mix with the egg beater. Pour the mixture into the Lister Bread Tin which has been slightly buttered on the bottom. Place in slow oven and bake for 40 minutes. Remove from the tin when entirely cool.

Whole bread, protein 53, carbohy-Value:

drate 0, fat 18, calories 374.

Special Recipes for Nephritic Diets

7. Nephritic Milk Drink:

Whey, 1 glass.

2 tbsp. heavy sweet cream.

Whey is prepared as follows: Dissolve 1 junket tablet in one pint of milk, heated until warm. Stand until thickened and then heat until whey separates. Drain through cheese cloth.

Value: Protein 3, carbohydrate 11, fat 11,

calories 155.

8. Nephritic Custard.

1 yolk only, 1 tsp. sugar, 1 tbsp. cornstarch.

½ cup cream (8 tbsp.)

½ cup water.

1 tbsp. orange juice.

Mix cream and water. Add yolk beaten slightly with sugar and cornstarch. Add orange juice. Bake in 3 small custard cups until set or boil until thick.

Value: 1/3 recipe, protein 2, carbohydrate 8, fat 15, calories 175.

9. No. 1 Blanc Mange:

2½ tsp. cornstarch.

3/4 tbsp. sugar.

4 tbsp. heavy cream.

6 tbsp. water (1/3 cup). Virginia Dare flavoring.

<sup>\*</sup> Note: Virginia Dare extracts, sugar-free: lemon, orange, almond, celery, can be obtained in many grocery stores. For further information address Garrett & Co., 10 Bush Terminal, Brooklyn, N. Y.

† D-Zerta gelatine, sugar-free, can be obtained in several flavors in a number of drug stores. Manufactured by Jello Co., LeRoy, N. Y.

Add water to the cream. Heat in double boiler. Add cornstarch moistened in cold water and sugar. Cook until well thickened. Add Virginia Dare flavoring if desired and chill.

Value: Protein 2, carbohydrate 30, fat 20,

calories 308.

## 10. No. 2 Blanc Mange. (As above).

If fruit from group No. 1 is added, then values are: Protein 3, carbohydrate 45, fat 20, calories 372.

#### 11. Raisin Cake:

34 cup sugar. 1/2 box seedless raisins.

Juice of 1 orange (fill cup to 34 with water).

2 thsp. butter.

2 tbsp. maple syrup.

Bring the above ingredients to a boil. and add 11/2 cups flour and 3/4 tsp. soda dissolved in water. Pour in special tin. Bake in slow oven.

Values: Recipe, protein 21, carbohydrate 543,

fat 37.5, calories 2594.

1 slice, 1/2" thick, protein 1.5, carbohydrate 40, fat 2.5, calories 188.

(One slice is equivalent to 3 portions of fruit group No. 1).

12. Fudge:

I cup sugar. ½ cup cream. 2 tbsp. butter. Pinch salt. Vanilla, as desired. Cocoa, 3 tbsp.

Mix all ingredients. Boil until a little forms a soft ball when dropped in cold water. Cool and beat until thick. Pour in buttered pan and let harden. Divide into 20 pieces. Each piece contains protein 0.5, carbohydrates 10, fat 3.5, calories 73.

#### 13. Gelatine recipe:

1 tsp. granulated gelatine. 11/2 tbsp. cold water. 14 cup cream, whipped. I tsp. lemon juice. 1 tsp. sugar, 1 fruit group No. 1, chopped fine.

1/4 cup boiling water,

Soak gelatine in cold water. Dissolve in boiling water. Add lemon juice, sugar and chill until it is the consistency of heavy molasses. Stir in fruit pulp, fold in whipped cream and chill.

Values: Protein 4, carbohydrate 36, fat 15, calories 295.

## Special Recipe for Obesity Diet

14. Low Caloric Custard:

1 cup skimmed milk. 1 whole egg. 1 white of egg only.

Virginia Dare flavoring.

Beat whole egg and white slightly. Add saccharine. Add all to milk. Add flavoring, Bake in 3 small custard cups until set.

Values: 1/3 recipe, protein 5, carbohydrate

4, fat 1, calories 45.

A very important advantage of this diet system is that after a short use of the diet list patients become sufficiently accustomed to it so that they may often dispense with the printed instructions.

#### Conclusions

A simple system for the preparation of diets is presented with illustrations of its adaptability to use in the treatment of diabetes, nephritis and The availability of a practical method makes possible the wider application of dietetic control in metabolic disturbances.

# TREATMENT OF INTRA-ORAL CANCER WITH SPECIAL REFERENCE TO RADIUM THERAPY\*

# By DOUGLAS QUICK, M.B. (TORONTO), NEW YORK, N. Y.

N making an appraisal of the present value and adaptability of radium in the treatment of malignant diseases of the mouth, it may first be well to call attention to a number of generally accepted facts.

1. Practically all of our clinical experience with radium has been acquired during the past

fifteen years.

2. The present conception of radium is, for the most part, based on two factors, the first, individual case experiences, many of them naturally unhappy; the second, the three to five-year end-results, a group discounted by the fact that the cases being appraised were treated by inexperienced methods of three to five, or more years ago.

3. During this past year rather unusual advance and improvement in methods of technical radium application and dosage have been made. These prove nothing statistically, as yet, and probably mean very little to the casual observer, but, they do mean a great deal to those of us engaged intimately in the work and seeing the changing results of treatment from month to month.

4. Radium must not be regarded in any sense as a specific in the treatment of cancer. It is the exception rather than the rule to see a case of mouth cancer, at least, taken care of entirely by radium to the exclusion of other associated measures, that is, if all possible advantages are accorded the patient.

5. A certain number of the failures from irradiation during the past fifteen years must quite properly be charged up to the accumulation of

experience.

6. A certain number of failures during this period also should quite properly be charged up to the operator and not to the agent itself. I refer to inadequate radium supply, inadequate dosage, and failure to take advantage of the most up-to-date knowledge of the problem at any given time.

7. The palliative benefits of irradiation are unquestioned. In a large number of cases symptoms have been relieved entirely, or in part, for a worth while period and operative surgery has been relieved of the burden and responsibility for cases that were obviously beyond its scope.

8. Radium has contributed, in intra-oral cancer, as elsewhere, very definitely toward the renewed histological and biological study of malignant diseases. Further advances are dependent quite as much upon study along these lines as upon further knowledge of the physical and technical radium problems.

In reviewing our progress of the past fifteen years, we note first that surface applications of radium for the serious treatment of cancer within the mouth, were discontinued in our own Service as far back as 1917. In only three cases of tongue cancer were we able to bring about a complete and permanent regression of the disease by these surface applications. Two of these patients are still well; the other died in 1929 of carcinoma of the bladder, in no way associated with the mouth lesion.

From 1917 to 1925, results improved through the use of the unfiltered emanation seeds, or "bare tubes" as they were called. The only thing to be said in favor of these implants is that better results were obtained through their use than by other measures then available. The pain and tissue necrosis attendant upon their use, however. were severe.

In 1925, Dr. Failla, Director of Bio-physical Laboratories at the Memorial Hospital, was able to replace these unfiltered emanation tubes by gold emanation tubes. These latter have the advantage of filtering out the softer and more caustic radiation, leaving only short wave-length gamma rays to affect the tissues about the im This technical improvement added a plants. decided therapeutic advantage by permitting much more intensive dosage with less local inflammatory reaction, must less tissue necrosis, and a relative decrease in the pain attendant upon treatment. There has been a gradual trend to much heavier dosage brought about through the factors just mentioned and also by means of additional experience in the use of high-voltage x-rays for external application.

During the past three years we have had the advantage of four grams of radium element in a single container for external irradiation. This, also has contributed toward increasing both the quantity and quality of our external applications for those patients who have been fortunate

enough to be treated by this means.

Recently, progress has been made in the direction of accurate dosage measurements. My associates, Drs. Martin and Quimby, have measured by accurate physical means and by mathematical calculation, the exact amounts of irradiation delivered to the tumor-bearing area in a large series of successfully treated cases so that they have been able to calculate in terms of erythema doses, the number or percentage of erythemas necessary, apparently, for the successful treatment of various histological types of growth. (I am assuming that it is generally known that the more embryonal types of growth are more sensitive to radiation while the more

<sup>\*</sup>Read before the Medical Society of the County of New York, December 23, 1929.

adult types are more resistant) Drs Maitin and Oumby have found that the intensity of dosage necessary for the successful treatment of most epidermoid carcinomas ranges between six and ten skin erythema doses within the tumorlearing area delivered in a period of two to three weeks. The variation in percentages or in number of erythemas depends upon the histological type of growth in question. The embryonal transitional cell carcinoma, or lympho epithelioma, of the nasopharynx or hypopharynx requires the minimum treatment, as far as epidermoid carcinomas are concerned; while squamous carcinoma, on the other hand can rarely be counted upon for complete regression with much less than ten till erythemas

Furning the information thus gained to account, it has been possible, knowing the histological type of growth and the size and relative location of the tumor-berring area, to calculate in advance the exact amount of irradiation considered necessary for the treatment of a given case and to decide the most accurate as well as the most economical means of delivering this predetermined amount of irradiation to the tissues in question.

This greater accuracy naturally renders the whole problem of treatment more complicated, but it is most essential. However, it should be understood that we make a distinction between mathematical accuracy and the treatment of can cer mathematically. At no time has judgment and good, substantial, old-fashioned practice of medicine been more necessary in deciding nicely many of the problems which arise in the individual cases than in doing just this sort of work

With this conception of the complicated factors attendant upon treatment by irradiation, it readily becomes apparent that the problem is at least one for a group, if not indeed, for an institution rather than an individual alone, and that in this group, the physicist plays a very important part

It may be well to state here that the treatment of cancer must be regarded as a surgical problen and must be approached as such. It holds no place for the radium "technician," mexperienced in general surgery, with a mediocre knowledge of the general problems of cancer and with usually a very incomplete radium equipment There is little if any place, in my judgment, for the radium renting agency. The various problems for the treatment of the individual case are such that it is seldom possible to meet all of the requirements to best advantage by a skeleton of portable equipment. It is questionable, furthermore, if such work ought to be attempted as an occusional problem or as a side-line to general surgical practice

The actual application of radium, other perhips than external application, is strictly speak-

mg, a technical surgical procedure 1-radiation is a very necessary complement to complete irradiation in most of the cases but should be under surgical supervision Operative surgery is far from being supplanted in the treatment of intraoral cancer but, in our opinion, we believe that for the treatment of the primary growth particularly, it is complementary to the irradiation is our opinion that irradiation should be depended upon for control and eradication of the tumorbearing area but that for drainage and for access to certain otherwise maccessible tumor bearing areas, as in carcinoma of the maxillary antrum. and for secondary invasion of the laws by new growth, operative surgery must be resorted to

In the neck, on the other hand, the relationship between irradiation and surgery is somewhat different For the treatment of cervical nodes we have followed a very different plan from the generally accepted one of routine block dissection, for the past twelve years. Our gen eral procedure is a combination of irradiation with surgery in certain of the cases The principle followed has been the same throughout the entire period, with certain changes, based on additional and new experience made from time to During the past few years we have been increasing the intensity of our external irradia-In certain types of cases with operable neck nodes, experience has taught us to rely entirely on irradiation and refrain from neck dis-These are the embryonal types of epidermoid carcinoma which Dr Ewing has chosen to term transitional cell carcinoma, a term embodying a somewhat larger group than the lympho epithelion as of Schmencke and Regaud. We have noted, clinically, that these transitional cell growths are more radio-sensitive than the more adult types of epidermoid carcinoma and we believe that they have done better when treated by external irradiation and by radon implantation than by irradiation plus complete neck dissection

Our indication now for complete unilateral neck dissection is limited to the adult type of epidermoid carcinoma with palpable metastatic node, or nodes, the capsule presumably intact, with unilateral involvement only and with good prospects as far as the primary growth is concerned. Surgical exposure with gold tube radon implantation is resorted to in addition to external irradiation in the embryonal type epidermoids and in all other cases where the node capsule has been perforated by the disease. With these various changes dictated by additional experience, the treatment of cervical netistases, however, is still a combination of irradiation and surgery.

The problem, as we view it, both in the mouth and in the neck, is still a surgical one calling for a good deal of operative surgers but with radium in our opinion, playing the major role

# TREATMENT OF INTRA-ORAL CANCER WITH SPECIAL REFERENCE TO RADIUM THERAPY\*

# By DOUGLAS QUICK, M.B. (TORONTO), NEW YORK, N. Y.

N making an appraisal of the present value and adaptability of radium in the treatment of malignant diseases of the mouth, it may first be well to call attention to a number of generally accepted facts.

1. Practically all of our clinical experience with radium has been acquired during the past

fifteen years.

2. The present conception of radium is, for the most part, based on two factors, the first, individual case experiences, many of them naturally unhappy; the second, the three to five-year end-results, a group discounted by the fact that the cases being appraised were treated by inexperienced methods of three to five, or more years ago.

3. During this past year rather unusual advance and improvement in methods of technical radium application and dosage have been made. These prove nothing statistically, as yet, and probably mean very little to the casual observer, but, they do mean a great deal to those of us engaged intimately in the work and seeing the changing results of treatment from month to month.

4. Radium must not be regarded in any sense as a specific in the treatment of cancer. It is the exception rather than the rule to see a case of mouth cancer, at least, taken care of entirely by radium to the exclusion of other associated measures, that is, if all possible advantages are accorded the patient.

5. A certain number of the failures from irradiation during the past fifteen years must quite properly be charged up to the accumulation of

experience.

6. A certain number of failures during this period also should quite properly be charged up to the operator and not to the agent itself. I refer to inadequate radium supply, inadequate dosage, and failure to take advantage of the most up-to-date knowledge of the problem at any given time.

7. The palliative benefits of irradiation are unquestioned. In a large number of cases symptoms have been relieved entirely, or in part, for a worth while period and operative surgery has been relieved of the burden and responsibility for cases that were obviously bound its seek

for cases that were obviously beyond its scope. 8. Radium has contributed, in intra-oral cancer, as elsewhere, very definitely toward the renewed histological and biological study of malignant diseases. Further advances are dependent quite as much upon study along these lines as upon further knowledge of the physical and technical radium problems.

In reviewing our progress of the past fifteen years, we note first that surface applications of radium for the serious treatment of cancer within the mouth, were discontinued in our own Service as far back as 1917. In only three cases of tongue cancer were we able to bring about a complete and permanent regression of the disease by these surface applications. Two of these patients are still well; the other died in 1929 of carcinoma of the bladder, in no way associated with the mouth lesion.

From 1917 to 1925, results improved through the use of the unfiltered emanation seeds, or "bare tubes" as they were called. The only thing to be said in favor of these implants is that better results were obtained through their use than by other measures then available. The pain and tissue necrosis attendant upon their use, however, were severe.

In 1925, Dr. Failla, Director of Bio-physical Laboratories at the Memorial Hospital, was able to replace these unfiltered emanation tubes by gold emanation tubes. These latter have the advantage of filtering out the softer and more caustic radiation, leaving only short wave-length gamma rays to affect the tissues about the im This technical improvement added a plants. decided therapeutic advantage by permitting much more intensive dosage with less local inflammatory reaction, must less tissue necrosis, and a relative decrease in the pain attendant upon treatment. There has been a gradual trend to much heavier dosage brought about through the factors just mentioned and also by means of additional experience in the use of high-voltage x-rays for external application.

During the past three years we have had the advantage of four grams of radium element in a single container for external irradiation. This, also has contributed toward increasing both the quantity and quality of our external applications for those patients who have been fortunate

enough to be treated by this means.

Recently, progress has been made in the direction of accurate dosage measurements. My associates, Drs. Martin and Quimby, have measured by accurate physical means and by mathematical calculation, the exact amounts of irradiation delivered to the tumor-bearing area in a large series of successfully treated cases so that they have been able to calculate in terms of erythema doses, the number or percentage of erythemas necessary, apparently, for the successful treatment of various histological types of growth. (I am assuming that it is generally known that the more embryonal types of growth are more sensitive to radiation while the more

<sup>\*</sup> Read before the Medical Society of the County of New York, December 23, 1929.

of the United States, speak of the high mortality attending childbirth. It is a subject that should demand our careful consideration especially when we reflect that such casualties fall upon women in the prime of life and usefulness, and are often preventable.

In discussing this subject, I shall contrast the advantages and disadvantages of home vs. hospital childbirths under the following topics: Delivery room preparation, Childbirth emergencies, Infections, Nursing service, the physician's attitude, the patient's attitude, and the financial cost.

## 1. DELIVERY ROOM PREPARATION:

Most of the preparation for the delivery can be arranged with equal thoroughness in the home or in the hospital. A sterile obstetric package containing cotton balls, a gown, sheets, leggings, gloves, towels, gauze, and umbilical tape should be ready. The bed may be raised to the level of a delivery table by placing it on blocks. A lead light is a common article in most homes or the doctor may make that a part of his obstetric equipment. scissors, clamps, and other instruments required by the doctor can be sterilized and kept in a sterile towel during the labor. Other articles including a scale to weigh the baby, make the equipment in the home exactly as one would expect to find it in the hospital.

A home delivery conducted with haphazard methods and with little or no preparation is certainly a relic of old midwifery and should have no place in modern obstetric practice nor should it be compared to hospital obstetrics. Gas oxygen equipments for the relief of pain are now a common convenience in the hospitals but seldom used in the homes. To my mind that is a serious drawback for home deliveries. Most mothers dislike painful childbirths and any method which can be used with safety to the mother and child is certainly a blessing. In my experience the inhalation of a few breaths of gas oxygen mixtures at the time of the painful contraction will always relieve pain and even put the mother to sleep for a few sec-The recent hypodermics and rectal treatments advocated by Dr. Gwathmey can be used to relieve pain for the home as well as hospital cases, but I do not think that this method is applicable to every case as is Gas Oxygen. Another valuable use for the oxygen part of the gas oxygen apparatus is to resuscitate the asphyxiated baby.

# 2. CHILDBIRTH EMERGENCIES:

Rarely a labor is of such a short duration that the baby is born at inopportune places as en route to the hospital or delivery room. It may occur on the elevator or stretcher.

Such emergencies may also occur in one's

own home. I once attended a patient who had precipitated her full term baby at home in the lavatory bowl without medical attendance. These events are very rare and the best we can say is that the patient is less shocked if she is in her own home rather than hospital surroundings. On the other hand if she is at the hospital, the lacerations often resulting from such rapid deliveries can be more promptly repaired in an accurate manner.

No doctor can positively predict whether a given patient will or will not have a post partum hemorrhage occasionally of a terrific nature. Rarely fatal maternal shock terminates a delivery or the baby may need resuscitative medicines and the prompt activity of at least three trained assistants. We know that such emergencies do occur and must admit that they can be far better treated at the hospital where there is an elastic supply of equipment and trained personnel.

## 3. INFECTIONS:

One of the chief setbacks to the general hospital as a place for childbirths is the possibility of infection from other patients or diseases about the hospital. This danger is not so positive when one is delivered at home or in a strictly isolated maternity. The carriers of infection in the general hospital are doctors, internes, nurses, hospital employees and bacteria in the air. Using the words of Dr. Young,2 "In a hospital catering for mixed cases the opportunities for the leakage of sepsis from infected to clean cases are so numerous and insidious that an iron discipline of segregation is the first essential. An infected case otherwise can scatter the seeds of sepsis from receiving to labor room or theatre and thence to the ward in the process of contaminating tables, bed linen, basins, floors, bed pans, instruments, hands and gowns of the staff and so on. At the time when admission and labor rooms are working at high pressure, the damage done within a few busy hours may be enormous."

Quite often a nurse or an interne in a general hospital will assist in the care of maternity patients hardly long enough to understand the technic, when they are transferred to other parts of the institution. This condition makes it more difficult for those in charge to use proper technic in caring for such patients.

Another objectionable feature which is prone to cause infection in the general hospital is the fact that the doctors who use the delivery room are very loosely organized and no standard method or technic of delivery is in use. Each physician has his different method of preparing the patient for delivery and as a result the nurses are confused, unfamiliar with any routine and necessarily less efficient. My cases of

post partum infection are more numerous among hospital than among home confinements.

Dr. Mary De Kruif's from a study of 370 deaths of primiparous patients states that sepsis ranks slightly higher among hospital booked cases as a cause of death than among home deliveries. In one of the general hospitals where I worked, there were 17 of a group of 38 consecutive primiparous patients who had an elevation of temperature of 100 or over on two or more consecutive days following the delivery. There were three from a group of 37 consecutive multiparous patients who likewise showed an elevation of temperature on two or more successive days. I might add that these patients were cared for by 18 different staff doctors.

Dr. De Lee<sup>4</sup> has stated that the full surgical dignity of obstetrics is not being thoroughly realized in most general hospitals. He also writes<sup>5</sup> as follows: "Since carelessness, ignorance, and frailty are human faults, natural barriers must be placed between the danger and the patient." In other words, when a prospective mother is confined, she should not be placed on the same floor or in a room adjacent to infectious surgical or medical cases.

When a childbirth occurs at home, the patient has merely to resist her own family of micro-organisms and not those of other patients. I believe it is far more important to have surgically clean childbirths at general hospitals than at the homes of the patients because the patient has not developed an immunity to the bacteria about such institutions, that are foreign to her organism.

The maternity service of the general hospitals where I have worked seem to be the most neglected part of the hospital. The nurses caring for maternity cases use the same utility rooms that are used for infectious cases. Two hospitals have the delivery room on a different floor from the labor room. If the elevator does not work the patient must walk up stairs at the end of her labor. An occasional overflow of ward maternity patients will be cared for on the open medical ward.

Tears of the vagina and perineum are often satisfactorily repaired after home deliveries without infections but it is quite difficult to repair a torn cervix in the home without subsequent infection.

With the advancing knowledge of medical science, we have come to realize the significance of old, torn, scarred or infected cervices in the development of a later cancer formation. According to Dr. F. C. Walker<sup>6</sup> of Indiana, "To-day, there are living in this country thousands of women who have cervical lesions that will become definitely malignant and terminate

fatally within the next three years." In view of this it seems quite advisable for the obstetrician to examine and promptly repair the deep tears of the cervix but this cannot be done in the home without danger. The neglect of this procedure may necessitate a subsequent hospitalization of the patient a few months or years after the baby is born.

# 4. NURSING SERVICE:

If the patient has a special nurse at home who is trained in aseptic technic, it may not be necessary for the obstetrician to bring along his registered nurse for the normal cases. I believe that in order to make a comparison of hospital and home childbirths it is absolutely necessary for at least one person to be at hand during the delivery other than the doctor, who understands operating room cleanliness.

When maternity patients are admitted to a general hospital and cannot afford a special nurse who devotes all of her time to the baby and mother, they are cared for by the nurses on general duty. Many of these nurses have had too little experience in the proper care of such patients and are not closely supervised due to the manifold and varied duties of the supervisors. Further these nurses are called upon to care for patients (not maternity) who may be of an infectious character.

The ideal nursing service for the maternity patient is a full time nurse who does not care for any other patients and we must admit that this service is more often secured in the home than in the general hospital.

# 5. THE PHYSICIAN'S ATTITUDE:

Every one knows that a doctor can take care of two or more patients with much less expenditure of time and energy if they are in the same hospital than if at different parts of the city.

Many details of preparation for the delivery and after care are provided by the hospital. In the home, the responsibility of such details falls upon the physician. I believe that the patient should expect to pay her physician a higher fee for home childbirths than those at the hospital, because they require more of his time, energy and responsibility.

The physician knows that when a patient is in the hospital her pulse, temperature and other details are recorded on the chart at frequent intervals and he can be aware of her condition almost at a glance. This is not true in the home. Furthermore in addition to the nurse's record, the physician may call upon the resident hospital doctor for assistance without expense. This likewise is not true with home

I do not insist that the nurse attending home

a lot to do to care for the infant and mother in a home where seldom things are, as convenient as at the hospital

#### 6 THE PATIENT'S ATTITUDE

It is a pleasure to know that most people realize that the hospital is an institution very well equipped to care for the sick. More and more prospective mothers are seeking the hospital as a place to have their baby and not that alone but as a place to rest and recuperate after the tedious long months of writing.

I think we physicians should stress the importance of freedom from home cares and the necessity of being away from the annoyance of older children during the first two weeks after the new arrival. Our patient's attitude must be friendly toward the hospital She must know that even though the hospital routine is not like her home, yet it is for her own good While she is at the hospital, her confidence must be gained and any annoyance as regards service, noise or food must be known and corrected. Only in this way can we expect the apprehensive patient to feel mentally at ease as she would were the childbirth to occur in her own home

#### 7 FINANCIAL COST

In Troy the total cost for the first ten days' general hospital care of maternity patients who are on the ward service averages \$50.00. This includes all usual charges such as fees for delivery room, laboratory, dressings, care of the baby, etc. Each additional day after the first 10 days, costs about \$3.50 per day.

Patients who desire private rooms, pay \$65.00 and upward for the first ten days care found \$4.50 and upward per day for thought day. The price varies with the

location of the room

one compares these prices with the of livery in the home, especially when obe employed at the prevailing test of crivith a cook or house maid it into the critical state ideal place for a children with a cook or house maid it into the consideration of the critical state ideal place for a children with a cook or house maid in the physician for the extra preparation and a sponsibility of the home delivery.

It is interesting to note the opinion of a few or obstetricians of this country in regard childbirths in the home. Dr. John J. Gill' is the igo believes that deliveries may be suctily conducted in the home and that intertions rarely occur Dr Harry S Fist\* of Los Angeles also believes that home deliveries can be made safe but that care and preparation are required Di A B Davis of New York says that it is possible to care for any case in the home that can be cared for in the hospital Dr J B De Lee of Chicago also thinks it is possible to give proper care to a maternity patient in the home Dr B C Hirst of Philadelphia refuses to take patients unless they go to the hospital Dr J W Williams of Baltimore also limits his work to hospital deliveries Dr P B Bland thinks better work can be done in a hospital

#### SUMMIRS

Home and general hospital childbirths are discussed with reference to proper preparations, obstetrical emergencies, infections, nursing services, the physicians' and patients' attitude and the relative financial cost. It is obvious from this article that except for the possible greater frequency of infection in the general hospital and the limited ability of the nursing service for patients unable to afford a full time nurse, that the general hospital is a more advantageous place for a childbirth

Home childbirths are desirable and successful when there are no complications and when the patient does not want the maxium relief from her pain. In as much as it is impossible to always predict complications, general hospital childbirths insure greater safety.

It is also obvious that the defects pointed out can only be overcome by absolute isolation of maternity from other patients and by closer supervision of employees and hospital technic

# A CASE OF HAEMOPNEUMOTHORAX OF UNCERTAIN ETIOLOGY

By ARTHUR H. TERRY, JR., M.D., NEW YORK, N. Y.

HE literature on haemopneumothorax is comprised of four cases, two rapidly fatal, and two with recovery.

The first, a young man, reported by G. N. Pitt, M.D. in 1900, was seized with sudden pain in his right shoulder, rapid collapse and signs of blood and air in the chest. A tube was inserted in the chest with removal of blood and air. Death ensued the same day. Autopsy revealed no TBC and the only abnormality was a pleural adhesion with an emphysematous bulla.

The second case of fatal haemopneumothorax of uncertain origin, reported by H. D. Rolleston, M.D., in 1900, was also a young man who was seized with pain in his right shoulder and abdominal pain with rapid collapse. At first, peritonitis was diagnosed but the second day there were signs of pneumothorax. The chest was tapped with removal of blood and air. The general condition did not improve and the patient died eight days from onset.

A careful autopsy revealed no lung rupture, no TBC, no leakage from pulmonary artery, normal glands of the chest, normal intercostal and internal mammary arteries, no signs of scurvy in the joints and no evidence of source of blood or air into the pleural cavity.

The third case of haemopneumothorax, reported by R. Doria in 1928, was also a young man who was seized with pain in his right shoulder and shortness of breath. A diagnosis of hydropneumothorax was made and 400 cc. of air removed. Eight days later, because of increasing pain and dyspnea, 200 cc. of bloody liquid was removed. The intra pleural pressure was found to be negative. Bloody liquid was removed several times and replaced by nitrogen to prevent further bleeding. The patient recovered in about three months and was well two years later.

A fourth case of spontaneous haemopneumothorax, reported by L. M. Hurxthal in 1928, was also a young man previously well who was seized with pain in his right shoulder, shortness of breath, pallor without cyanosis. His abdomen was rigid, the pulse was 120, and the blood pressure was 80/70. Blood and air were found in the right chest. On the third day 2400 cc. of venous-like blood was removed from the chest and replaced with an equal amount of air. This relieved the symptoms and stopped the cough. This procedure was repeated once, a week later, and the patient soon recovered and was also well after an interval of four months.

These four cases all began with a sudden onset of pain in the right shoulder, dyspnea and collapse. Two were rapidly fatal and careful autopsies failed to reveal the cause of the blood and air in the chest. One recovered with the removal of blood and replacement by nitrogen and the fourth, who was evidently a more severe case, also recovered by the removal of large amounts of blood with the replacement by air.

A fifth case is now presented, not only because of its rarity but also because of its severity and recovery due in part to the use of the oxygen tent.

# PRESENTATION OF CASE

History. Present illness: E. K., age 34, suddenly seized with pain in left shoulder region, dyspnea, cold perspiration and weakness so that he was brought to the Beekman Street Hospital in a taxi, October 19, 1928.

Past: No TBC but five years ago an attack of pleurisy with prompt recovery.

Personal history: Habits normal except for three cups of coffee and considerable tobacco.

Family history: Good with no tubercular tendencies.

Examination on admission: Young man, rather thin, very pale, acutely ill, lying in bed, eyes normal except that pupils are small from a hypodermic of morphine. Throat and teeth normal, chest long and thin walled moving symmetrically on both sides. Lungs hyperresonant, no adventitious sounds. Heart normal except that the sounds are heard more medial to the sternum than usual. Blood pressure 110/65.

The next day, October 20, 1928, the lungs are clear, temperature 98, blood pressure 160/90.

Urine normal. Wassermann, negative. October 21, 1928. Blood pressure 125/90.

Temperature normal.

October 22, 1928. Systolic blow at apex. Pain gone. A pleuropericardial rub was heard to the left of xiphoid, heard in recumbent position, disappearing on sitting up. Allowed home. Diagnosed neurosis of the heart. Temperature 98, pulse 70, respiration 20.

# READMISSION

Admitted October 22, 1928. Discharged January 8, 1929.

Diagnosis: Haemopneumothorax.

Left the hospital today but on the way home in a taxi was seized with another stabbing pain similar to the one for which he was previously admitted, so promptly returned to the hospital in the evening.

Patient dyspneic, somewhat cyanotic, pulse 80, regular, pleuropericardial rub gone, but no note

of other change in physical signs.

October 23, 1928. 5:30 A.M. Seized with another sharp attack of precordial pain radiating to the back. Patient extremely ill in a cold sweat, respiration 30, finger tips cyanosed, lips colorless.

Unable to swallow. Heart racing between 120 and 130. At this time it was noticed that although his left chest moved with respiration, there was an entire absence of breath sounds on this side and tactile fremities was absent. Only anterior examination was made on account of patient's poor condition. On later examination, left chest expanded a little but was tympanitic.

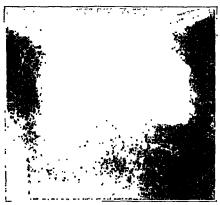

Plate 1
Left Haemopneumothorax

Fremities diminished on left, bronchophony left axilla. Dullness left base. No rubs or rales. Apex of heart not felt. The sounds were best heard just to the left of ensiform. X-ray showed left pneumothorax, left lung partially collapsed but held out like a tent (See Plate 1), with fluid lower ½ left chest.

Impression, hydro pneumothorax, left; possibly

nulmonary TBC.

October 24, 1928. Because of increasing dullness in left chest, needle was inserted and four-teen ounces of blood removed. Condition much worse; dyspneic, pale and apprehensive. Pulse racing between 140 and 170. Respiration 40. Transfusion of 500 cc. Diagnosis, Haemopneumothorax.

October 25, 1928. Condition possibly better but dullness in chest increasing. Temperature 100. Pulse 120. Respiration 25. Question as to whether he has not bled more intrathoracically.

October 26, 1928. Left chest does not expand with inspiration and in front is dull below the third space in mid clavicular line and dull from apex axilla down. Upper part of left chest hyper resonant. No coin sound. The voice sounds over lower part of left chest accompanied by metallic tinkle, characteristic of air and fluid.

October 27, 1928. Worse. Dyspnea, air hunger, taking deep breaths with his mouth wide

open. Pulse 120 to 140. Pale, sweating, apparently insufficient breathing capacity. Condition critical. Question of tapping. If no tap is done, patient will probably die in a few hours from respiratory failure. If tap is done, he may bleed more. Therefore, thoracentesis was done. 530 cc. of dark red bloody fluid mixed with air. Immediate improvement. Respirations easier.

Improvement was transitory—thirty minutes later dyspneic and definite air hunger. Pallor extreme. Cyanosis not noted, probably because

of extreme pallor.

Oxygen tent was erected—50% to 60% concentration. Patient's condition improved almost at once. Respirations still rapid but not labored. Pulse 120.

October 28, 1928. Temperature 101½, pulse 100, respiration 24. Patient easily aroused. Says he feels fine. No pain. Breathing without effort. Definitely improved. In changing oxygen tank, patient immediately extremely dyspneic and anxious. Relieved by resuming oxygen.

October 29, 1928. Considerable improvement. Lips red. If there is no further intrathoracic

accident, patient should recover.

October 30, 1928. Oxygen tent discontinued during the day, condition good. Pulse 100. Tent resumed at night as respirations increase, he looked anxious, pulse 110. With resumption of the tent, there was instantaneous improvement in the patient's condition.

October 31, 1928. No oxygen in the daycomfortable day. Resumed oxygen at night as

PLATE 2

Blood fiding most of left chest

patient complained of room seeming close and breathing was difficult.

November 1 to 4, 1928. Patient doing well and comfortable. Oxygen administered in decreasing amounts, frequency and concentration.

November 5, 1928. Entire left chest flat. No

more oxygen necessary.

November 12, 1928. Left chest resonant from clavicle to fourth space in left anterior axilla line. Apex under nipple. Steady improvement.

November 15, 1928. Posteriorly dull to flat from apex to base, but breath sounds come through very well. No rales at either apex. Temperature 99, pulse 90, respiration 20. There has been a gradual defervescence of temperature to normal today.

November 19, 1928. Clinically improved. Chest clearing slowly. Moderate resonance an-

teriorly, dull posteriorly.

Improved anteriorly, November 22, 1928. more resonant and more breath sounds. Posteriorly, more resonance, good fremities, faint breath sounds.

November 30, 1928. Apex in space four, two inches left of mid sternal line. Anteriorly, chest resonant. Posteriorly, chest more resonant than previously but still dull to flat from above down. Bronchophony below angle of left scapula. No coin sound or metallic tinkle on shaking. Steady improvement.

December 3, 1928. Signs the same. (See

Plate 2.)

December 13, 1928. Left chest expands a little more and there is increasing resonance be-

PLATE 3 Convalescent Haempneumothorax

hind, but breath sounds are heard only as low as angle of scapula.

December 31, 1928. A little pain on deep respiration, otherwise O.K. (Plate 3.)

January 5, 1929. No more pain. Temperature remained normal, Pulse remained 85, Respiration remained 20.

January 8, 1929. Patient discharged from hospital to convalescent care at home.

January 5, 1930. Patient returns to hospital by request for re-examination. Has married and returned to work, feeling well. Looks healthy, chest resonant, lungs clear, heart normal, temperature normal, pulse rapid—rate 110, due in part

PLATE 4 Recovery

to excitement incident to re-examination. X-ray of lungs normal. (See Plate IV)

# LABORATORY REPORTS

X-ray. October 24, 1928, x-ray shows almost complete left pneumothorax with fluid level to one inch above the angle of the scapula. Right lung free from disease.

November 5, 1928, left lung filled, entirely ob-

scured, probably by fluid.

November 14, 1928, and November 26, 1928, x-ray shows collection of fluid occupying the space about the semi-expanded lung. (See Plate

December 4, 1928. No change in .r-ray. December 10, 1928 and December 28, 1928. Very little change in shadow. (See Plate 3.) Urinalysis—normal.

Red Blood Count. As low as 2,700,000 with hemoglobin 60%, gradually increasing to 3,740.-000 with hemoglobin of 75%.

White Blood Cells. Increased to 14,700 on October 27, 1928 with polymorphonuclears 89%, gradually returning to 8,000 with a normal differential on discharge.

## COMMENT

There are very few cases of haemopneumo-, thorax reported.

This patient, who seemed to be dying from lack of lung capacity, was apparently saved at once by the use of the oxygen tent.

#### A REMEDY FOR FEE-SPLITTING AMONG DOCTORS\*

By GEORGE FLETCHER CHANDLER, M.D., F.A.C.S., KINGSTON, N. Y.

TT is astonishing how few among the lasty understand what fee-splitting is. gent, well informed people when they hear the word almost invariably ask me what it means. To such I usually explain it as follows:

"When a doctor has seen a patient and diagnosed the case as one needing a specialist, he sometimes sells his patient, unbeknown to the unsuspecting victim, to the highest bidder. In other words, Dr. A calls upon Dr. B, a specialist, and by a secret arrangement with him it is understood that the large fee charged by the latter shall be split between them, and Dr. A shall receive a goodly proportion of it for having sent him the case. The patient and his family have no information of this and take it for granted that the specialist is chosen for his ability. Therefore he is accepted in good faith."

This practice is a vicious one because men who are not thoroughly grounded in their work can start out as specialists by making arrangements with physicians to whom they offer one half or even three quarters of the fee in exchange for a case. They therefore build up their practice at the expense of the patients.

The best surgeons will not do this. Dr. A for money deliberately risks his patient's life by sending him to an unscrupulous operator

who will divide the fee.

This custom sprang up in the profession many years ago with the advent of high prices charged by specialists, just as bootlegging became common following the Volstead Act.

That the practice is in general use is recognized by the American College of Surgeons, which requires every man taking the degree of Fellow to sign a pledge making it a point of honor to abstain from such division of fees.

During the last fifteen years hospitals have increased throughout the United States at a most astounding rate owing to the fact that better work can be done where there is every facility, and because family life of the old type is disappearing. Nearly everybody works, and consequently there are few people left at home to care for the sick; whereas in a hospital the patient can get constant attention and expert care.

The advent of mechanical transportation with its attendant accidents and the accidents of industrial workers as a result of machinery, are other reasons for the necessity of hospitals.

In the old days most hospitals had a regular staff, and physicians not on this staff might

\* Read at the meeting of the Albany County Medical Society, Inly, 1930.

send patients in but could not operate there themselves nor treat them. Such hospitals were called "closed hospitals" and many such still function, but the majority of the hospitals today are open to any physician to go there and treat his patient or to operate. While this is seemingly an equitable thing, it still has its bad points for it has developed what we might call "over-night specialists.

Communities have drives to raise money for building and maintaining hospitals. who have given their money for this purpose naturally feel that they should have the right to select their own doctors to treat them while they are in the institution. In such communities where any doctor has the entree and the use of the hospital, young men may start doing surgery without adequate preparation and often buy their way to a practice by fee-

splitting.

All hospitals that are registered under the Hospital Standardization of the American College of Surgeons compel the physicians making use of the hospital, as well as those on the staff, to sign a pledge against the splitting of fees. This has helped, but the pernicious practice goes on in spite of the pledge. In fact the hospital itself offers opportunities for camouflaging the abuse.

For example, the doctor sending in the patient may work in the same hospital as the operator, and he can pose as an assistant by washing up, putting on an operating gown and cap, and then standing around during the operation. After the operation is over, he goes out to the patient's relatives with the surgeon and talks as though he had really assisted. In some cases the operator even allows him to assist though he is not well trained, and through some slip in his aseptic technique, the patient becomes infected and may die. More often he has a stormy convalescence or an infected wound, and his stay in the hospital may be days longer than it should be with consequent more expense to him; or he may never be well afterwards because of rupture or adhesions resulting from the infection. At best, a bungling assistant slows up the operation to the disadvantage of the patient. For an operator to take on such a man as an assistant at the risk of the patient's life is nothing short of criminal.

It is not an easy thing for one physician to accuse another of fee-splitting, for it is often very hard to prove. The doctor who receives the money from the specialist will obviously not mention it. Neither will the surgeon.

The practice has been insidiously built up. Years ago drug stores used to give a percentage to some physicians who were not of the best character for sending them prescriptions. Truss manufacturers and belt manufacturers formerly did the same thing; but this practice has been gradually abandoned and rarely will any self-respecting doctor or druggist countenance such a procedure nowadays.

Up to this point I have said nothing but what is already well known to all doctors and to many laymen. These things have been discussed in medical societies and in medical magazines and have of late found their way into publications read by the people at large. But never as yet have I heard nor have I read one practical suggestion as to a remedy for this abuse

Standardization of Fees of Specialists:— I am proposing an agreeable remedy which will stamp out the evil, please the patient, and finally even prove of benefit to the one who administers it. This remedy is the standardization of fees.

Fee-splitting is undoubtedly the result of high prices charged by specialists, and the two evils are inextricably united. High fees have made surgery and specialty work very attractive to young doctors who wish to attain prosperity early in life, and we therefore have a surfeit of so-called specialists who are not properly trained and are lacking in experience, while that backbone of the medical profession, the family doctor, is fast losing his importance. This is a calamity!

The real specialist who has become one through years of training and hard work in his own line, who confines himself exclusively to his specialty, is perhaps entitled to a good fee and does not stoop to any method of buying a practice from his brother practitioner.

Let me make it clear that I am not against specialism in medicine. A man may have given long study to a certain part of the body and be an authority on certain ailments, but I maintain that his advice is not necessary in all cases. Eighty-five percent of all the people who consult a doctor are going to get well anyway, and the general practitioner is perfectly capable of diagnosing and treating them. Among the other fifteen percent, the advice of a specialist may often be necessary or at least of great benefit, but to ship every emergency case to a specialist is an economic waste.

Hospitals and colleges and doctors alike are thinking too much about their own advantage and their own benefits and not enough about the patient. It seems to me that the sick person is the one to be considered first. His pocket-book as well as his ailment should be given consideration. In the present mode of procedure he may be sent to one man to have his skin examined, to another for his kidneys,

and to the third for his operation. When he is finally restored to health, he has no money left to educate his children and is too discouraged to begin life over.

The theory upon which high prices are based is that a man should pay according to his means. In other words, the rich man is charged a large fee while the man of moderate means gets the services for much less, and the poor man gets it free.

After a time a surgeon or specialist in any line gets in the habit of receiving large fees, and it is very hard for him to consider small ones at all; and so he usually charges more than he should.

It is argued that the surgeon does so much free work that the rich should average up the doctor's income by paying heavily. There is something radically wrong in this reasoning.

A rich man may buy antique rugs for his home, paintings by famous artists, exquisite porcelains for his table, and priceless jewels for his wife. The poor man knows well that he cannot afford these things, and so he contents himself with the comforts that are in keeping with his income; but when it comes to necessary operations and treatment by surgeons and specialists, there is no such thing as doing without these for economy's sake, and there is no market for different grades of work.

An operation is an operation, and a rich man by paying ten thousand dollars does not get any better operation than the poor man who pays fifty dollars. Neither is the body of a rich man any more delicate to work on than the body of a poor man. No surgeon, however mercenary he may be, will do poor work on a living patient. It is to his advantage to do the best he can, and no matter how unethical a doctor may be, he is honest in his endeavor to save human lives.

The result of an operation cannot be guaranteed as the repair of furniture can be. A chair may be repaired or replaced and the guarantee made good; but no matter how well a surgeon does his work, the patient may possibly die. The material used in operating on the rich man is no better than that used on the poor man. Neither are the instruments any better nor can the surgeon hurry through the job. It takes just as long or short a time to remove a tumor whether the patient be rich or poor.

It is argued that if a rich man should die, it will hurt the doctor's practice more than if he were a poor man, because the latter is not so well known. I do not believe this to be so, for everyone knows that death comes at some time in spite of all human endeavor, so that the practice of a surgeon does not suffer

through a fatal outcome. In fact possibly the best physicians and surgeons have the highest death rate, because they have the hardest cases brought to them to take advantage of their skill.

Fees should be standardized. If the rich man felt that he wanted to pay more than this, he could, at the doctor's suggestion, give to the hospital where the work is done. He could help a surgeon by giving him better equipment, thus helping the community and the less affluent patients. The rich are doing this now, but they could do more of it and lighten the burden for the ordinary individual who pays the doctor often more than he can afford and

gives to a hospital as well.

If a man devotes himself entirely to surgery after years of apprenticeship during which he has gradually broken away from general practice, then he is worthy to be called a surgeon; he has more time than the general practitioner, and will do enough surgery at reasonable fees to make an excellent living. High fees are not necessary to make good money. Henry Ford's idea is a good one,—a volume of work at moderate fees. A surgeon certainly can do five hundred operations a year, and if his average is a moderate fee for a major operation, his income at the end of a year will be a very good one as incomes go in the United States. Also he would not pauperize so many people. Those of moderate means would pay a fair fee, and those too poor to pay could still have their surgery done for nothing just as it is now.

What the standard fee should be is hard to say. It would depend of course on the community in which a surgeon practices. In the larger cities it would necessarily be higher

than outside.

In many communities the majority of the people are in modest circumstances. They wish to pay for their medical work, just as they wish to pay for their groceries. Such people are too proud to have a member of their family go to the hospital as a free case, feeling toward such an arrangement exactly as they would toward having the city send them a ton of coal. They want to pay; and often the high fee charged by the specialist they employ lays upon such a family a debt which is a heavy burden. These people are entitled to services at a price within their means.

As an excuse for outrageous fees we hear a great deal about doctors not being paid at all for their work,—and it is true. I think figures state that there is an approximate loss of about forty percent of accounts on the books. It seems to be Nature's law that there should be a great loss in all production. This is manifest when we see the number of blossoms on an apple tree and realize how few come to fruit.

Only a small percentage of the energy of coal transformed into steam can be applied to machinery. The same with the force in gasoline. Grocers lose money. Tailors lose money. In fact every occupation that a man is engaged in shows some loss in collections. Only the salaried man knows exactly the amount of money he will get for what he does.

Since this is a universal rule in business and in Nature, why should it not obtain in the professional field? It would seem that if specialists charged more reasonable prices, they would realize more on their accounts, and lower their percentage of poor bills because more patients would be willing to pay for doctor's services if the charge were within

their means.

Approximately ninety percent of all people in this world are decent and honest, grateful for a doctor's services, and glad to pay what they can afford; ten percent do not intend to pay and won't pay; another ten percent intend to pay but find themselves unable to do so; but the percentage on collectible accounts should be eighty percent good, and would be if fees were lower.

A word now for the doctor who has treated a family for years. In the event of a surgical case it is he who has made the diagnosis, taken the responsibility of the decision, convinced each and every member of the family of the necessity of a surgical procedure. Is it fair that this man should refer his patient to a surgeon who does his work in a brief time. and then charges such an enormous fee that the patient sometimes has to mortgage his home to pay it? The family doctor has to wait for his modest remuneration until the burden of the other debt is removed. He waits sometimes for years before his bill is paid, and sometimes forever. It is no wonder that the splitting of the surgeon's big fee seems to him something of a fair decision.

So many men are posing as surgeons today and attempting to do surgery that the competition is too great and there is not enough paying surgery to go around. Surgeons who should be doing nothing else, therefore do general work as well and so encroach upon the general practitioner. Such men usually do not excel because no man can serve two masters well. If surgeons devoted themselves exclusively to surgery and charged reasonable fees, the family doctor would not have them in competition with his own work and would consequently not encroach on the operative

Today the question of the high cost of medicine has become one of the most pressing with which the American public has to deal. If the physicians are not careful, they are

field.

going to find that insurance companies, who are already showing signs of interest, will insure individuals and families against sickness. It is already being done in California, to my knowledge, and eventually these insurance companies will hire the less successful physicians to look after the families and will engage unscrupulous men, who may be clever, to do their surgery. The hospitals are open and who shall say that they may not work there? They will work regular hours for the insurance companies at a salary, and have time for golf and other things just as the business man has. This condition is almost certain to come as a direct result of high prices. It will be a great blow to the medical profession, for the dignity of the profession will go and a poorer class of men will take up the work.

Of course there are always doctors who will rise above the common herd, and there may be a few great men of medicine even if insurance becomes a general thing. Possibly wealthy people will not take out such insurance and may wish to hire physicians of their own selection. Then fees will go higher and higher, and gradually this will be one of the factors that will tend to bring about only two classes of people in America,—the so-called rich class, and the so-called poor class. Our great middle class will go, and with it goes the keystone of the arch which holds up our democracy.

Should surgeons and specialists lower their fees and charge the rich man a moderate fee, and a fee within the scope of the man of smaller means, making all fees practically standard for operations, the specialists could make a splendid living by limiting their work to their own specialty and the family doctor who would do general work only would come back, and also have a good income. Insurance of health would not then seem to be

the paying proposition for the insurance companies which it now appears to them.

Young men who wish to become surgeons or specialists would then work under some master until they were thoroughly equipped, and could eventually limit themselves to their specialty.

Then, too, the free clinics would not be used by people who can well afford to pay a moderate fee. Today, municipalities and hospitals, churches and lodges, give their time and money for the care of individuals, many of whom are able to pay and should pay a moderate fee, but are instead getting something for nothing.

It seems logical to me that the best way to stop fee-splitting is the standardization and lowering of fees so than expert surgical service may be within the reach of everyone except the extremely poor who will get it for nothing. Then the medical profession could go back to the better plan of having family physicians who are capable of diagnosing and handling the bulk of their practice without extraneous aid, and make an excellent living thereby. And should the services of a specialist be indicated, the family doctor can recommend a man in whom he himself has confidence, and who will not drain the financial resources of the patient sent to him.

Such a specialist will not need to split fees to get his work, and in time the surgeon who charges the moderate fee will be recognized as the man who holds the supremacy in his own field.

Thus fee-splitting, a cancer in our profession, will be cured by the remedy of moderate fees, and the public, who is the patient, will be benefited, while the family doctor will again come into his own and hold in the American heart and home the place he deserves.

#### WHAT ORTHOPEDIC CONDITIONS THE GENERAL PRACTITIONER HAS TO LOOK FOR IN A PERIODIC EXAMINATION'

By SAMUEL W BOORSTEIN, MD, FACS, NEW YORK, N Y

TN general, the orthopedic examination can be divided into tour parts. I irst. Inspection of the patient while dressed-stanling sitting and walking Second Inspection of the patient while undressed-standing, sitting and on the Fourth Testing the Third Palpation

ability to perform normal motion

The examination is begun while the patient is standing, using 'inspection and pulpation" We order the patient to walk, to sit down and get up, and bend down to pick up objects from the We then order him to perform certain floor motions, watching him performing these motions, also palpiting the limbs while these are performed so as to test the proper muscle tone and cause of limitation of motion if any

We examine the patient on the table while he lies on his back, and on the tice Where a defect is present, we resort to measurements with the

tape measure

#### Inspection

On inspection, while the clothing is on, we learn at once the relation of weight to height A patient may not be too stout according to the normal ratio, still the inspection proves, that, due to partial abnormality, he is, and vice versa

We then look at his attitude Does he keep the head straight? If not, is it a torticollis or defect in vision? Has he any tremors or abnormal motions of the limbs? How are his shoulders? Are they on the same level? Are the hips on the same level? Even through the clothing, one can tell As a matter of fact, the tulors and dressmakers frequently find that they cannot fit the dress properly due to mequality of hips or We also observe his spine to see shoulders whether he is round shouldered or if a lateral curvature is found. Is there i tilt of the entire body to one side? Are the shoes turned over to a side? Bow legs and knock knees can also be recognized, it the patient stands with teet parallel and together

We order the patient to walk and we watch his gait. Normally a person bears the weight momentarily on the heel, then upon its outer border, the heel is then raised and the weight is put on the The body is then lifted over the tips of If he hmps, make a note of it and examine more carefully when he is undressed Tell the patient to bend down and pick up objects from the floor A normal person does it quickly, even when the knees are straight. Have the patient then sit down and get up. The evidence of tremor or abnormal motion indicates neurological complication and should be referred to him

Read as part of a symposium on Peri he Health Examitation before the Bronx County Medical Society in December 26, 1929

This in general covers the examination while patient is dressed We order the patient to undress It is of advantage to watch the patient undress hunself, as in this manner the physician is able to see whether he uses the limbs properly When undressed we again resort to inspection and palpation, beginning at the top

Inspection while standing. We can notice any deformity, observe joint contour, (i e the joints have a normal shape which is designated as joint contour), swelling of any part or atrophy, co or

of the limbs

Deformities noticed (1) On face asym Torticollis metry (2) Neck (3) Eleva tion of one shoulder or scapula (4) The curves of the spine In general there is a well defined lordosis (bending forward) in the lumbar region with a rounded kyphosis (bending back) in the dorsal region. In some, however, one finds the kyphosis markedly exaggerated constituting the round shoulders in mild cases or spondylitis de formans in the severe cases The lordosis is exaggerated in the bad posture cases. The change in the abdominal tone found in viscaroptotic cases diminishes the normal physiologican intraabdominal pressure (5) Real determities of the spine as scoliosis or gibbus (a kniickle), found in tuberculosis of the spine or old fracture of vertebral bodies (6) A tilt of the spine as found in sacro iline is at once noticed (7) The chest Is there a funnel or depressed is inspected chest? Even in malposture of the spine, the backward flexion of the dorsal spine embarrasses the respiratory excursion of the ribs and thus diminishes the vital capacity of the thorax (8) In women, especially obese girls, it is advisable to pay attention to the mammary glands Frequently they are too large and weigh on the shoulders causing round shoulders and pain Often one breast is on a lower level and should be suspended by a special binder (9) The position of the arm elbow and hand should next be looked to Is there any swelling or atrophy of one side as compared to the other? One has to keep in mind that normally both sides of the body are symmetrical and a lack of symmetry usually indicates an abnormality. One, of course, has to remember that the right arm and forearm normally are somewhat stouter. Is there any defect of the fingers? (10) The hips standing attitude may reveal a prominence of one hip over the other, a difference in the height of ant sup spine, a flexion of the thigh and assump tion of positions tending to relieve the affected limb of its share in weight bearing is readily observed. The list to one side is also more distinctly brought out (11) The knees changes in joint contour are easily recognized

Deformity as knock knee or hyperextension of knee is seen at a glance. Atrophy of thigh and swelling of knees. (12) Feet . . . relation of long axis of the foot to the leg. Normally a line drawn through the middle of the patella and leg, if prolonged, must fall in the middle of the second toe. If it falls inward of the first toe, we know that the foot is turned out or everted, hence a weak or flat foot. This is a more reliable criterion than that of wet tracing of the sole of the foot to determine the height of the longitudinal arch. The prominence of the inner malleoli show weak feet and not weak ankles. Hallux Valgus and varicose veins are also readily discovered. Of course looking at both legs and feet one sees the relative size.

While patient is still standing, we inspect the color of extremities. Besides local redness found in acute inflammatory conditions, the hands may show marked blueness which disappears on raising. This may indicate cervical rib. The color of the feet are important. If they show a blueness or deep red which later, on raising, blanche quickly—thrombangitis obliterans should be suspected.

Calluses and corns can easily be seen. The ordinary corns are on the dorsal or lateral surfaces of toes. Those on plantar aspect are frequently papillometa, the so called "seed warts."

#### Palpation

On palpation, one determines whether the muscles are flaby or have good tone. The surface temperature can be felt best by using the dorsal aspect of the examiner's hand. The pulse in the dorsalis pedis should be examined if the toes show redness or blueness. If there is any swelling, ascertain whether it is bony, fluidy or capsular.

#### Motion

The patient is then ordered to walk and his gait indicates whether or not there is a limp. Close observation will show whether the limp is in the ankle, knee or hip.

The same is true of ordering the patient to sit down and get up. You can recognize whether he favors one joint or another. Does he sit squarely on the chair? Or on rising, does he have to support himself with his hand?

While sitting, flex the hips on the abdomen, first with flexed knees, then with extended. In many cases of sacro iliac, this can not be done.

The patient is then ordered to pick up an object from the floor to note whether the spine bends or is held rigid. You may have him bend the spine to either side, extend it (or move it back) to see whether the spine moves with perfect freedom in all directions.

We then have the patient move both the upper extremities simultaneously, then the lower. If you remember all the motions that each joint has, you can have the patients go through the same motions swiftly. One should remember that in any joint or capsular disease, all the motions of the joint will be limited. If some of the motions are free and others limited, the trouble is not in the joint proper. By watching both sides, you can see the difference. If there is a limitation, examine at once to see whether it is due to bony block. This is ascertained by the sudden stoppage of the movement. When the stoppage is due to spasm or to adhesions, the stoppage is gradual. One also watches for hypermobility of any joint.

The patient is put on the table and the motion of the ankles, knees and hips, especially of the abdomen are tested. The patient is ordered to rise from lying position to the sitting position, without help. This will show whether he has good power in the abdominal muscles.

While on the back, the glands can be examined to exclude glandular enlargement. Also any tender points of the body discovered.

If there is a shortening, the limbs have to be measured. The following measurements are required:

R.A.: Distance from right anterior-superior spinous process of ilium to internal malleolus.

L.A.: Distance from left anterior-superior spinous process, etc.

R.U.: Umbilicus to right internal malleolus.

L.U.: Umbilicus to left internal malleolus. R.T.: Circumference of right thigh.

L.T.: Circumference of left thigh.

R.K.: Circumference of right knee.

L.K.: Circumference of left knee. R.C.: Circumference of right calf.

L.C.: Circumference of left calf.

R. Arm and R. Forearm.

L. Arm and L. Forearm.

An examination of this kind should take fifteen to twenty minutes. Of course when the physician does his general examination at the same time, it will not take more than ten additional minutes as some of these tests are naturally used for his other examinations.

#### DISPENSING INFORMATION

The Medical Society of the State of New York is the clearing house of information regarding the activities of county medical societies. The State Society deals with problems of a state-wide nature, such as the development of agreements with the State Department of Labor regarding medical services to injured workmen. It is necessary that information regarding all forms of society activities be given to members of county societies as soon as possible after their occurrence.

It seems to be the opinion of the leaders of the State Society that this Journal is satisfactory as to its contents of information; but that to get the members to read the news pages of the Journal carefully may require some special devices, such as weekly bulletins and personal letters from committee chairmen. But the most effective means of inspiring members to seek information is their personal contact with field workers of the State Society, such as the officers of the District Branches.

### PRESIDENTIAL COMMENTS ON CURRENT EVENTS-NO. 6

Conferences of Medical Leaders: With the beginning of September there will be a general resumption of the activities of organized medicine throughout the state. In addition to four of the District Branch meetings that occur in September there will be the usual conference of the Secretaries of the County Societies, and for the first time state-wide conferences of the chairmen of the Public Relations, Economic, Standing, and Special Committees. A major purpose of these new conferences is to give to these keymen an opportunity of becoming acquainted with what each state committee is doing and what each county committee is undertaking to do. An effort is being made in this way to develop an understanding as a whole of what is being undertaken by the State Society and have it conveyed to the County Societies so clearly that there will be increased cooperation this year.

There will be an effort made throughout the year to keep alive an understanding of the relationship that each county bears to the whole program. It is apparent that there is no way to do this better than by conference.

A Weekly Bulletin: The next step is to think out a method of efficient publicity. This could be done by a Weekly Bulletin, to be issued every Saturday morning so that on Monday it would be in the hands of about ten per cent of the membership of the State Society actively engaged in carrying on the work. There is at present no method of prompt distribution of information to the men who are doing the Society's work, and no efficient way of quickly securing the Society's opinion.

I would particularly like to draw attention to the lack of up-to-day-of-occurrence medical news publicity for the officers and committeemen. This publicity should be put into such shape that it can be passed on later to the county societies for information. A great lack in organized medicine in this state is simply quick information of what is going on. We already attempt to do this in the Legislative Bulletins each winter.

A Bulletin would have to be edited with conciseness, clearness, frankness, without any statement of theory, with as little individual opinion as possible, and greater than all, with promptness. A Bulletin would not have to conform to the editorial standards, now by common consent and approval imposed on a medical journal.

A second result that would flow from prompt medical publicity to our own membership would be the increased opportunity of obtaining prompt opinion on any subject. A great defect in getting medical things done nowadays is in the difficulty in getting medical men to unite their opinions. Long established individualism will sooner or later have to be overcome if the profession is going to solve its own problems before it is too late, and to meet new obligations imposed by the social trends of the times.

I know of nothing so likely to bring about an understanding of what is meant by a readjustment of relationships to social needs as conference and publicity. As a whole, the profession does not seem to understand the power of unanimous opinion. All efforts to bring about beneficent advances are more or less opposed by individuals or small groups who do not possess adequate information of what it is all about.

Medical men do wonderful things in the face of great disasters, but when it comes to constructive effort to solve their own problems and determine their relationship to public interest, some will disagree in spite of an overwhelming majority. If the medical profession would thrash out problems, and when conclusions are reached, support them to the extent of one hundred per cent, it would get everything that it needs.

My own observation and experience as an officer or committeeman for several years convince me that the greatest factor in not reaching unanimous conclusions is lack of information. I am aware that I may be starting something, but the idea of a Bulletin is not new and I am only taking up an idea that has been presented before. There is always danger whenever one steps out of the beaten pathway; but how else can we find new pathways? Just because things have always been done in one way is no reason why they cannot be done better in another way. Just keep in mind that the Legislative Committee has published a Bulletin during the Legislative Session for years, and that the Public Relations Committee last year took its first step toward better publicity by sending out personal letters to keymen in County Societies. The chairman of the Economic Committee proposes to do this for his Committee this year. Business economy compels a combination of these efforts.

A discussion of these points will have its value in arousing interest.

WILLIAM H. Ross.

#### THE NEWER MEDICAL STANDARDS

Medical ethics, as well as the law, require that a physician shall give the best scientific treatment that is available at the time and place of his treatment. A physician, for example, must have an x-ray photograph of every one of his fracture cases.

The same principle applies to the practice of medicine by county medical societies. The people expect the medical profession of the county to advise the community regarding public affairs in which health is involved. Moreover, every individual physician is jealous of his exclusive right to give an opinion on every health problem, whether it be of a public on a private nature.

The officials of every municipality, from the hamlet and the town up to the State, are confronted with demands for action in problems involving health; and they naturally turn to the local physicians for advice. They may ask the opinion of only one physician who does not represent his colleagues. Then, too, the problem may be one requiring investigation and study. Physicians have therefore developed the practical plan that the county medical society shall

act as the medical profession in giving advice to municipalities and the public.

Community medical problems are as definite and uniform as the prevailing diseases of individuals in New York State. Certain public health movements are under discussion in every municipality, among them being immunizations against diphtheria, the physical examination of school children, and the prevention of tuberculosis. There are also universal problems of health administration, such as the employment of county public health nurses and the establishment of county departments of health

The officers of the Medical Society of the State of New York are earnestly seeking to inspire the members of county societies to take action in regard to public medical problems in

their own communities.

When a family doctor is confronted with a condition with which he is not familiar, he seeks the advice of a consultant. The State Medical Society is the sympathetic consultant to every county society that will accept its advice and assistance.

#### LOOKING BACKWARD

#### This Journal Twenty-five Years Ago

Reorganization: Twenty-five years ago the two State Medical Societies of New York had almost completed their plans for union into a single organization, which became effective on December 9, 1905. There had been much had feeling and many antagonisms, some of which were expressed in the following letter printed in this Journal of September, 1905:

"I have not acknowledged acceptance of service of notice of proposed amalgamation because I am not in favor of it. Nothing is to be gained, and it is a great injustice to those noble men who have made the Association what it is and who have been the means of opening the eyes and 'broadening the ideas' of the old State Society regarding eligibility to membership. There is nothing to hinder them joining the Association if they want and if they do not, they are not worthy of notice should they not unite with all others to further good medical legislation. I shall be very much crestfallen if the Association goes out of ex-

istence and I shall consider that all is again under the control of the old Society bureauracy."

Commenting on the letter the JOURNAL con-

"It would facilitate matters a great deal if each member of the Association would acknowledge acceptance of service of notice, without causing undue trouble or annoyance. This refusal of acceptance of service by a member, simply means that the matter may be carried into the courts, and may bring about a large expense and litigation, which is absolutely unnecessary. It seems to us that the refusal of acceptance of service and notification is puerile and absolutely beyond the idea of what medical men should consider the true fraternal spirit. Therefore, we are sorry that our correspondent sees fit to take such a gloomy view of the earnest work of our Committee."

# MEDICAL PROGRESS

Transitory Paralyses and Angina Pectoris. —Dr. L. Gravier of Lyons recalls the fact that temporary paralyses are not very uncommon in cases of hyperpiesis, and that most authors are in accord in ascribing these to spasm of the cerebral arteries. Indeed, there would seem to be no other possible explanation, especially in view of the analogous spasm of the retinal arteries as seen by the ophthalmoscope. The author has seen and studied a number of cases of temporary paralysis of which one of special interest was associated with attacks of angina pectoris. The patient, a woman 66 years old, had a moderate hypertrophy of the heart and for the past two years had had a progressively increasing blood pressure of 170-85, 175-90, and 180-100. For three years she had had attacks of angina pectoris of classical causation-overeating, wind, cold, psychic disturbances — which yielded readily to amyl nitrite and nitroglycerin. November, 1928, she suffered an attack of complete left-sided hemiplegia with aphasia (she was left-handed) which lasted 40 minutes and then disappeared completely. From that time the paralytic attacks recurred frequently, as often as two or three times every day. The paralyses, sometimes hemiplegic, sometimes monoplegic, never lasted more than 40 minutes, and often only 10 or 15 minutes. There were never any tonic or clonic convulsions, or loss of consciousness. In the meanwhile she had frequent anginal attacks-seven or eight a week. Under a course of antispasmodic treatment the attacks of paralysis ceased though the anginal crises persisted. thor groups this case with others of association of angina with Raynaud's disease, intermittent limping, and angiospasm of the retinal arteries. Aubaret, indeed, has given the name of ocular angina to this last named condition. The author concludes from the study of these various associations that angina pectoris is always to be regarded as due to coronary angiospasm, whatever the underlying lesion, whether aortitis, periaortitis, or even pericarditis, or mediastinal compression.—Archives des Maladies du Coeur, June, 1930.

The Exhausted Child.—Richard C. Clarke, who has made a special study of exhaustion and its effects on children, finds that the exhausted child is a far commoner phenomenon than it used to be, and that the condition is insufficiently recognized by the medical profession, by parents and by educators.

It is a condition in which there is general motor atony, of both the voluntary and involuntary muscles. The most obvious and dramatic sign is that the child maintains its upright position by the bony and ligamentous system rather than by muscular tone. The standing position of the child is the most important clue to its mental and physical health, Other signs are hyperextension of the elbow when the arm is extended and prominence of the scapular wing. Although the majority of these children are inherently nervous, some are not. Symptoms referable to the cardiovascular system are common and important, and depend upon the atony of the autonomic nervous system. Anorexia, capricious appetite, and other disturbances of the alimentary system are common. The exhausted condition is produced by the far too strenous life which these children lead. It is common among all classes, some of the worst cases being found among the children of the rich. It is curable by mental and physical rest. The whole system of "upbringing" must be modified, and the school work adjusted to the child's capacity. Early bed, midday rests, no parties or cinemas in term time, and as quiet a life as possible are all obvious precautions. These children take fats badly. The most suitable diet is mainly carbohydrates with the addition of glucose.—The Lancet, July 26, 1930, ccxix, 5578.

The Effectiveness of Rectal Ether in Whooping Cough and Its Comparison with Other Methods of Treatment.—W. Ambrose McGee emphasizes the importance of making use of two simple and reliable aids which are available for the early diagnosis of whooping cough, namely, the bacteriological examination and the white and differential blood counts. In a series of 150 cases, a positive diagnosis of pertussis was made in 64 instances from white and differential counts together with the suspicious cough. The average leucocyte count was 19,273. In 14 cases diagnosed as negative from signs and symptoms and the differential blood count, pertussis failed to develop. In the treatment of whooping cough McGee has had far more favorable results from the rectal use of ether than from vaccines, ephedrine hydrochloride, or cough sedatives. The percentage of effectiveness of rectal ether increased with the age of the patients. Children in private homes improved more rapidly than those in institutions. The usual dose was one drachm of equal parts of ether and olive oil

administered twice daily in the majority of cases. A No. 18-20 French catheter and a glass funnel were employed in passing the mixture by gravity into the rectum As a rule the rectal ether was administered for from five to twelve days, according to the response of the patient. The combination of other therapeutic agents with ether gave no better results than ether alone. This treatment caused a greater reduction of leucocytes per day than did any other method. Ether per rectum shortens the course of pertussis and greatly ameliorates its severity. The favorable results are probably due to the antispasmodic action of ether caused by its slow excretion into the pulmonary alveoli and the constant bathing of the respiratory mucous membrane with a weak solution of ether.—Southern Medical Journal, August, 1930, xxiii, 8.

Some Physiological and Clinical Effects of High Fat Feeding .- Harold L. Higgins summarizes the results in 41 cases of epilepsy treated with the ketogenic diet at the Massachusetts General Hospital. This diet apparently cures only about one-quarter of the patients. The effect of the ketogenic diet in epilepsy has been ascribed to the sedative action of acetone, to hypoglycemia, to acidosis, to the diminution of diurnal variations in the blood chemistry, to the diminution of fluid in the body tissues, and to changes in the bacterial flora. The author is inclined to believe that a combination rather than any one factor alone relieves the epilepsy. He describes experimental work which shows that the stools are more acid when the patient is on a ketogenic (high fat) diet. With this diet there is no change in the type of intestinal bacteria. The nitrogen of the stool, however, is very much lower, and bacteria account for from 50 to 80 per cent of the fecal nitrogen. There is less nitrogen because there are fewer bacteria. There is more intestinal bacterial activity when the patient receives a carbohydrate-rich diet than when he has a high fat diet. Next to starvation, the high fat diet keeps the intestinal bacterial activity at a Therapeutically, Higgins recomminimum, mends the high fat diet as a means for climinating intestinal toxemia, but instead of giving as much fat as the ketogenic diet requires, he finds that equal quantities of fat and carbohydrate are usualy sufficient to produce the desired effect. The epileptic brain is a wet brain. If this edema could be overcome, the patient should be relieved of his seizures. The common method of dehydrating the body are by fasting and withholding sodium chloride. A low carbohydrate diet also causes loss of body fluid. Apparently the body is better able

to overcome infection if there is no edema. and dehydration of the body is employed in certain conditions, such as certain types of poliomyelitis and encephalitis. Children on a ketogenic diet seem to be less frequently and less severely sick with the common respiratory infections. A similar condition is seen in the diabetic; as soon as he is sugar-free, his tendency toward infection diminishes. On the basis of these observations Higgins recommends the omission of candy and the limitation of sugars and starches as a prophylaxis against colds, though it is not necessary to limit the carbohydrate to the extent required by the ketogenic diet .- New England Journal of Medicine, July 24, 1930, cciii, 4.

Treatment of Bone Tuberculosis by Large Amounts of Vitamins A and D.-C. Lee Pattison states that the work of Mellanby and Gree, which has demonstrated the potent action of vitamin A on bacterial infection in animals, and their suggestive results obtained by treating cases of puerperal sensis with preparations rich in vitamin A, made it seem probable that the value of cod-liver oil as a therapeutic remedy in tuberculosis is really due to its vitamin content. He has, therefore, made observations to see whether the exhibition of much larger doses of vitamin A than those usually given in cod-liver oil would hasten the healing process in this disease. It was also decided to increase vitamin D in the diet as well as vitamin A. Two preparations were employed, both containing a large quantity of vitamin A, and one of them having a high vitamin D content in addition. A series of 43 patients were given large doses of these preparations, while 35 patients having similar degrees of infection and bone invasion were given 10 c.c. of cod-liver oil daily. Those to whom the special vitamin was given received very much more vitamin A than the control group. The clinical condition of the patients and the x-ray appearance of their affected bones were carefully recorded for some months before and during the test period. The tabulated results show that of the 43 patients having the vitamin preparation, 32 were improved clinically while 11 were not; in 25 of these 43 cases the x-rays showed arrest of the disease or increased calcification, while in 18 there was no evidence of such improvement. Of the 35 patients taking cod-liver oil, 25 were clinically improved and 10 were not. In 18 cases the x-rays indicated progress toward cure, while in 17 there was no such progress. Thus it seems that, under the conditions of the investigation, the use of preparations containing large amounts of vitamins A and D was of little more curative value than that of codliver oil.—British Medical Journal, August 2. 1930, ii, 3630.

Thoracic Stomachs.—A. Wilfred Adams, writing in the British Medical Journal, August 9, 1930, ii, 3631, presents a comparative study of pharyngeal pouch and cardiospasm, and reports three cases of these conditions. Ræntgenography, after the ingestion of an opaque meal, makes the diagnosis of these intrathoracic enlargements easy and convincing. They are liable, however, to pass unrecognized owing to their remoteness in the depths of the chest. They are found in the upper and lower ends of the gullet. In shape and in relation to the parent gullet, they resemble aneurysms, such as occur in the adjacent aorta. The upper enlargement is saccular and the lower fusiform in outline. Common to both is the important feature that the site of origin corresponds with a transition stage in the alimentary transport. During deglutition the food is squeezed from the mouth into the pharyngeal funnel, and here it is handed over to the involuntary peristalsis of the gullet. It is very probable that a neuromuscular dysfunction at the susceptible transition point in the gullet raises the pressure of the ingesta. The effect expresses itself by different forms of dilatation. The inherent weakness in the posterior aspect of the hypopharynx produces a hernia of the mucosa. By contrast, in the epiphrenic region, the esophageal walls respond to the hypertension within by a typical uniform dilatation and hypertrophy. spasm is a potent element in these cases, at least in the earlier stages, is evident from the sudden relief of obstruction, onward passage of food, and relief of pain. In pharyngeal pouch two-stage diverticulectomy is the best remedy. while cardiospasm, in the earlier stages will respond to mere dilatation with bougies, which is best done with the aid of the radiographic screen. Where this fails, Mikulicz's digital dilatation, by means of a gastrostomy, is necessary and effective. Dilatation with the hydrostatic bag of Plummer is objectionable because of the danger of rupturing the esophagus, and if this accident occurs it cannot be repaired at the time as when the open method is employed.

Morbus Coxæ Senilis.—Dr. L. Duvernay of Aix-les-Bains, in a contribution to the Patrik Haglund Festschrift of Acta Chirurgica Scandinavica, June 18, 1930, subjects this condition to a critical review in order to determine its nature and etiology. In the first place, he says, it is characterized by a marked change of form of the hip-joint. The femoral head bears no resemblance to the normal, the coty-

loid cavity is no longer present or is transformed into a nearly plane surface; the capsule, greatly elongated, is ossified for about its entire length, forming a hollow sphere enclosing more or less completely the modified head of the bone; variously shaped osteophytes surround the articulation and project bays of ossification into the neighboring fibrous and muscular tissues. Here is to be found an answer to the question why such changes seldom occur elsewhere than in the hip. The author points out that congenital dislocations of the shoulder or knee are non-existent or very rare, but are not uncommon of the hip; that scapula vara never occurs, but coxa vara does occur not infrequently, and that osteochondritis is more common in the hip than in any other articulation. Senile hip-disease is therefore not a pathological entity but is a pathological complex due to a subacute arthritis of various causation attacking a congenitally malformed hip-joint.

The Child's Heart in Health and Disease.— L. Hamilton enumerates physiological normalities in the child's heart. which, if found in the adolescent heart, might possibly be classified as disease. During the first six weeks of life there is a definite auricular enlargement which is physiologically normal. The pulmonic second sound acquires 'a booming character which tends to increase until after the second year. Murmurs and thrills may be apparent during the first few weeks of life, but these should soon disappear. During the first few days there may be various types of intermittent pulse, and sinus irregularities are frequently found. There is also the natural tachycardia of childhood. majority of congenital abnormalities are compatible with normal life, granted the child obtains normal care. Of acquired heart diseases the most important are the groups with rheumatic fever, chorea, tonsillitis, and those of "growing pains." The earliest signs resulting from these diseases are slowing of the heart, or an excessive and persistent tachycardia found early, a dropped beat (not a premature beat), complete transient heart block, enlargement of the heart, development of murmurs pericardial effusion, and at times friction rubs. The symptoms of more serious heart involvement may be any or all of the above, associated with increased temperature, leucocytosis, restlessness, irritability, dyspnea, gastric symptoms, cough, and marked and rapidly developing anemia. The universal treatment should be ultra conservative, the time of rest depending not only on the severity of the original disease, but on the amount of possible heart hurt. Salicylates are probably the most important of all medical

methods of treatment. Small's serum or vaccine is a valuable adjunct. Hamilton has used this cardio-arthritides serum and vaccine in some 12 cases of rheumatic fever and chorea, and finds it a valuable addition especially it used early in the disease. Convil scent care is of the utmost importance and is often not given due consideration. The heirt must be trained and strengthened by progressive activity. In all infectious diseases, care should be taken not to overstimulate the heart. Digitalization in diphtheria should be limited to the exceptional, rather than the usual case.—Irelates of Pediatries, July, 1930, xlvi, 7

The Psychoneuroses in General Practice. -Lawrence W. Lunt says the general practitioner is likely to regard neurotic patients as the weaklings of humanity and not worth spending much time on. He must recognize that the neuroscs are true sicknesses just as much as appendicitis and pneumonia, and as such it is distinctly a function of medicine to care for and treat them. While it is true that a neurosis is frequently started or continued by a definite or an obscure pathological somatic condition, the wise physician does not emphasize the physical aspect of the case, since many invalids are made by undue emphasis on disorders of physical function must approach the neurotic case with the least possible antipathy or prejudice. When he concludes that the condition which primarily needs treatment is a neurosis, a search must be made for the emotional cause. The physician must be alive to the far-reaching rôle the emotions play in everyday life, and particularly how, when disturbed, they directly affect the bodily mechanisms By sympathetically gaining the patient's confidence, the doctor must get him at the earliest possible moment to tell fully and freely what has happened in his life, and this is most important in young people and children. The sooner the problem is brought into the open the more favorable the chance for solution There seem to be three factors which cause most of our malfunctioning, namely, fear, the mating impulse, and selfassertion. The doctor must be prepared to explain misconceptions in regard to these in a manner suited to the mentality that is to receive the explanation. After having explained the normality that has become functionally disordered, the next step is reorganization Here the doctor must show the way, furnish the mitiative and push until restitution is certain. The process of reorganization is that of getting the patient to discard fallacious beliefs and techniques and to show him, by examples from his own and others' behavior, how he can respond in a more effectual way. A proper

schedule of daily activities must be arranged, with work of some sort, not too much rest, appropriate exercise and recreation, and medicine used only when honestly needed. The general practitioner who shows a genume interest in and tolerance for patients suffering from neuroses is a tremendously effective psychiatric outpost and prevents no small number of nervous breakdowns—New England Journal of Medicine, August 14, 1930, cm., 7.

Physical Therapeutic Treatment of Subacromial Bursitis.-George E Deering states that his prediction, made in 1916, that physical therapeutic means would be found to absorb the calcium deposits that occur in the bursa in some of these cases has proven true There are five stages or complications for consideration in treating this condition, though they are rarely all found in one case. These conditions are. (1) the acute stage with adhesions forming, (2) adhesions contracting. adhesions stretching; (4) atrophy, and (5) calcium carbonate and amorphous fat deposits in the bursa. In order to apply intelligent therapy it is most important to visualize the pathology throughout the comse of treatment Focal infection, trauma, exposure, or faulty metabolism must be corrected. Convective heat in the form of light or infra-red, together with diathermy and massage, are used in every case, except that diathermy is unnecessary in the development of atrophied muscle. In all cases, except rarely m the acute stage, vibratory massage should be a part of the treatment. Convective heat precedes each treatment. In the acute stage some form of restraint or immobilization is often necessary. The radiant heat and light followed by diathermy are each given for twenty to thirty minutes. In the second stage, that of contracting adhesion, chlorine ionization for its resolvent effect has proved most efficacious. In the third stage, that of stretch ing adhesions, in addition to the above measures, forcible manipulation, especially abduction, as well as active, passive, and resisted exercises, followed by massage, are used. Convective heat and conversive heat in the form of diathermy are always used when deposits appear, and are followed by chlorine ionization For muscle atrophy, the electric currents that produce contraction of muscle are employed, the sinusoidal, the static, or the faradic. Deering describes the technique in detail and emphasizes the importance of an understanding of orthopedic measures and also of the five distinct massage movements which produce different physiological effects -Physical Therapentics, July, 1930, xlvm, Z.

#### THE DOCTOR AS AN EXECUTOR

By LORENZ J. BROSNAN, ESQ.
Counsel, Medical Society of the State of New York

In making a will, many people, because of the confidence which they have in doctors, designate their physician or a friend in the medical profession as either one of or their sole executor. The designation, if accepted by the one designated and confirmed by the court's decree, carries with it the honor and distinction attaching to the recipient of such confidence and the emoluments termed "commissions" which are approximately two percent of the gross estate, but it also carries with it duties and liabilities. While it is impossible to treat the duties and liabilities exhaustively, your counsel will briefly consider the same in two distinct classifications: (1) The liability of an executor for holding investments, bonds, stocks, etc.; (2) the liability of a passive executor for the acts or omissions of his coexecutors.

In order to best understand the liability of an executor, we must look to the nature of an executorship. An executor is a person charged by law with the duty of administering an estate of a deceased leaving a will. He is either named as executor in the testator's will, or designated as such by another under a power so to do given by the will.

An executor derives his authority primarily from the will in which he is so named. The interest of every executor in his testator's estate is, therefore, what that testator gives him in the will. It is an interest of the highest fiduciary character, because upon an executor devolves the duty of carrying out the intention of the person who designated him—and at a time when such person is not able to direct the operations. Since the executor is selected by the testator principally because of the faith the testator has in him, the executor cannot delegate to others the authority accorded him by the will. This proposition of law was promulgated by Denio, C. J. when he wrote:

"An executor or trustee to whom a power has been given in a will may not delegate his judgment and discretion in the execution of the power\* \* \*."

Thus it can be seen that the nature of such duty is purely personal and peculiar to the person so clothed with the authority and not anyone else.

While the executor has the negative duty of in no way delegating the authority received under

the will, there also devolves upon him a positive duty of using reasonable skill, prudence and judgment in the exercise of his testamentary powers. The test which is applied by the courts is whether an honest man of ordinary diligence and reasonable prudence would have so acted in the management of his own affairs and in the handling of his own property. While the courts expect only a reasonable amount of diligence and prudence from an executor, yet they are quick to impose a liability by surcharging the executor for any loss to the estate caused by his failure so to act, irrespective of his good faith.

In a recent New York case, a will authorized the executor to invest in securities other than those recognized by law as legal securities for the investment of trust funds. Accordingly, the executor sold certain railroad bonds which had been entrusted to him under the provisions of the will, and invested the proceeds of the sale in bonds of a steamship corporation which had been organized only a short time. This corporation later failed and, while it was conclusively proven that the executor acted in good faith, nevertheless the court surcharged him with the loss resulting from the disastrous investment. The court in its opinion said:

"However much sympathy we may feel for the executor that he should have been lured into making such an investment while acting in good faith, no such sentiment can ripen into prudence or fair business judgment. He (the executor) elected to dispose of securities of soundness and established reputation (i.e., the railroad stock mentioned above) and invest in the speculative and unknown (the lately formed steamship company), and it cannot be for these infants to lose by reason of his error of judgment, which lacked ordinary business acumen, however honestly intended. It is my conclusion that the executor should be surcharged with the sum invested in the bonds of the ...... .. Steamship Corporation, together with interest thereon."

In a later case the courts have held that even a provision relating to holding investments or selling them without personal liability does not relieve the executor from care and responsibility regarding such investments. Again the courts have said:

"It does not follow that because prudent men may and often do conduct their own affairs with the hope of growing rich, and therein take the hazard of adventures which they deem hopeful, trustees may do the same; the preservation of the fund and the procurement of a just moome therefrom are primary objects of the creation of the trust itself, and are to be primarily regarded."

While this statement was directed towards trustees, the rule so stated would apply with equal force to an executor who by the terms of the will is obligated to hold and myest the estate

or any part thereof.

THE LIABILITY OF A PASSIVE EXECUTOR FOR ACTS OR OMISSIONS OF HIS CO-EXECUTORS

With respect to the representation and management of their decendent's estate, co-executors are regarded in law as one person, and consequently the acts of one of them in relation to the regular administration of the estate are deemed to be the acts of all, inasmuch as they have a joint and entire authority over the whole property. As has been said in an early New York case:

"If a man appoint several executors, they are esteemed in law as but one person representing the testator, and the acts done by any one of them which relate to the delivery, gift, sale or release of the testator's goods are deemed the acts of

all."

It would seem to follow from this principle that they have the power of joint and several agents of one principal, and that any act done or performed by one within the scope and authority of his agency is a valid exercise of power and binds his associates. One executor is bound to exercise vigilance to protect the funds of an estate if the circumstances are such as to create a doubt as to their safety, and he is responsible for a loss resulting from the waste or maladministration of his co-executor where he could have prevented the same and by his negligence failed to

do so. In other words, the passivity of an executor will weigh heavily against him when any loss is incurred by the estate resulting from the negligent mismanagement of it by the co-executor. A business man, for example, familiar with the values of property and accustomed to making investments, is not justified in leaving the entire management of an estate over which he is a coexecutor in the hands of his co-executrix without supervision or inquiry, she being a woman unacquainted with business and whose time is occupied with domestic duties. It has been held to be no excuse that the passive executor was apparently justified in replying on the integrity of his associate, even though testator had justification for such repose of confidence. We might very easily analogize this situation to that of a busy physician named as executor in a will and who, relying on the good faith, judgment and prudence of his co-executors, permits them to manage the estate-which management might prove disastrous to the doctor.

To sum up the foregoing: If you are designated as an executor, you are under no legal obligation to accept the appointment; if you do accept it, you are bound to carry out the terms of the will so far as the condition of the estate permits. In so doing, you must manage the estate in the manner that an honest man of ordinary intelligence and reasonable prudence would act in managing his own affairs and handling his own property; and if acting as executor in conjunction with others, you may be liable for their acts and should, therefore, make it your business to know what the others are doing in administering the estate. A good rule is this: Either do not accept the appointment or, if you do, then become and remain an active executor in touch with the management of the estate until a final decree of the court is obtained approving your acts as such.

#### CLAIMED NEGLIGENCE IN SETTING OF FRACTURED RADIUS AND ULNA

In this case the plaintiff called at a hospital for emergency treatment and gave a history of having injured his right arm while cranking an automobile.

The plaintiff was examined by the defendant physician. Arrangements were made for the administration of a general anaesthesia for the purpose of reducing the fracture. Prior thereto, however, x-rays were taken of the arm, and in conjunction with the x-rays and the examination, a diagnosis was made of a fracture of the radius and a fracture and dislocation of the ulna. The fractures were set and anterior and posterior splints applied examination and posterior splints applied ex-

tending from the metacarpal joint to the elbow. X-rays were taken after the setting of the fractures which showed the bones in good position. The patient then went home and thereafter called upon the defendant physician. The plaintiff was advised to exercise the fingers and thumb. He continued to call upon the defendant physician at stated intervals for examination. Approximately one week after the injury the arm was in good condition and felt better.

Ten days after the original injury the patient complained of a somewhat painful condition about the middle of the forearm. X-

rays were taken which indicated that the arm at the points of fracture and dislocation were satisfactory. The patient continued under observation and treatment for the following two weeks during all of which time the original splints were left in position. Four weeks after the first treatment the original splints were removed and smaller and lighter splints applied. The patient was examined from time to time during the next two weeks and the arm re-bandaged.

Approximately six weeks after the original injury all splints were removed and bandage applied. At that time the patient was making a good recovery but was not discharged. never returned for further advice or treatment.

About two months after the last date of treatment the defendant physician called upon the patient and upon examination it was found that there was a slight bowing at the radius at the seat of the fracture. Arrangements were made for the patient to call at the physician's office, which appointment was not kept.

Thereafter, the patient consulted another physician who upon examination stated that he found that the radius was broken at the iunction of the middle with the lower third: that the ulna was not fractured; that the frag-

ments had united in a state of rotation; and that the patient was unable to rotate the hand into a position of supination. Arrangements were made by this second physician for an operation for the purpose of allowing the hand to rotate into a position of supination. This physician also contended that he found the wrist dressed in the supinated position; that it was drawn into the position of pronation, in which he found it, by the contraction of the interosseous muscles, and that the pressure of the sling in which the arm had been suspended during the process of ossification had gradually caused the misplacement.

Some time after this operation by the second physician, an action was commenced by the patient against the first attending physician, which in due course came on for trial. The plaintiff, however, did not make out a prima facie case in law and was unable to establish that his condition was in any way due to the neglect or unskillfulness of his first attending physician. The complaint was therefore dismissed at the close of the plaintiff's case, without making it necessary for the defendant to take the stand or present any proof to contest the defendant's case. The action was thereby terminated in favor of the defendant physician.

#### CLAIMED NEGLIGENCE IN REDUCING A FRACTURE OF THE ARM

In this case, the plaintiff, a neurotic old lady, entered the office of the doctor and complained of a fracture in the arm, which arm had been fractured some time prior to that visit and which had received, as she claimed, negligent care from another physician. She was unusually vindicative in her remarks relative to the care and treatment she received from the physician and immediately impressed the doctor as a very irritable and intolerant person.

Upon examination there was disclosed a fracture of the right radius at the lower end of the wrist with a little swelling and deformity. It is interesting to note that during her prior treatment by the other physician she would under no circumstances acquiesce to x-ray treatment. Shortly thereafter she was prevailed upon by the defendant physician that an x-ray was the most efficacious means of determining the true extent of the fracture, and pursuant to this advice, she reported at a hospital for x-ray treatment.

The x-ray revealed a Colles fracture of right radius; marked displacement backwards of lower fragment showing a silver-fork deformity of the right wrist. Styloid process right ulna also fractured. It was decided that an operation should be performed. A traction

and extension with manipulation at the point of fracture was performed. Also assistance in counter-extension at the elbow. Then a Colles splint with upper and lower compartments was applied and her arm placed in a sling. Shortly thereafter another x-ray for position was taken and so favorable was the development of the injured member that thereafter she was treated at the office of the defendant physician. Close and regular examinations disclosed no swelling or blueness, and the patient made no complaint of pain. In fact the condition of the arm progressed so favorably that within two weeks after the operation, alcohol rubs and passive massages were given to the patient by the doctor. In about ten days, before the doctor had discharged her, the patient of her own accord failed to present herself for the customary treatment and while her condition was progressing rapidly and favorably, nevertheless, it did not warrant a termination of medicinal treatment.

Approximately eight months later, the defendant during that period having neither seen nor heard anything of the plaintiff, received a summons and complaint acquainting him with the fact that legal proceedings were being instituted against him by his former patient for

alleged malpractice in the treatment of the arm in question. The plaintiff recited that as a result of the failure of the defendant to reduce the dislocation from which the plaintiff suffered, the injuries became worse and that upon the refusal of the defendant to further treat the plaintiff she was obliged to and did procure another surgeon to operate upon her wrist and restore the bones to their proper place

The case was noticed for trial and appeared upon the calendar from time to time, but

before the action was reached it was marked off at the plaintiff's instance and no steps were ever taken by her to restore said case to the calendar Subsequently the defendant moved to dismiss the complaint for lack of prosecution, but before an occasion for the machinery of the law had presented itself, the plaintift entered into an agreement with the detendant whereby the action was discontinued, without costs, thus terminating the case in the doctor's

#### DEATH OCCASIONED BY AN ADMINISTRATION OF ANAESTHESIA

It appears that in this case an infant while playing, injured her finger to such in extent that the parents decided the injured member needed medical attention and they forthwith brought the child to a doctor

Upon examination it was discovered that the finger was badly contracted and that an operation was necessary to which the mother consented Arrangements were made at the hospital which was subsequently named as co-defendant in this action. A week later the child was brought to the hospital for the operation. An anæsthetic was administered by one of the internes of the hospital and the operating doctor then cut the skin which contracted the finger straightened it out and then raised the subcutaneous skin on the girl's loin, making a tunnel and sewing the skin to the finger Then he put on a plaster of Paris bandage around the lom and finger, thus holding the finger in position on the loin, with the skin attached to the finger

The infant was under the anasthesia about twenty-five minutes and recovered from it without any ill effects, remaining in the hospital without anything unusual occurring, and the finger remained bound to the loin

About two weeks after the operation had been performed, the operating doctor who had been in constant attendance, decided to release the finger from the loin and cut away the graft which showed so good a union that he had the child taken to the operating room where an interne of the hospital, conclusively proven to have been experienced in the administration of anæsthesia, delivered the anasthesia. The operating doctor then proceeded to remove the plaster of Paris bandage and cut away the finger from the loin and proceeded to attach the flap to the finger After he had been working on the finger for ap proximately one-half hour, during which time the child appeared to be taking the other normally and without any sign of cyanosis, the doctor noticed the child had stopped breathing. He

immediately called the attention of this fact to the doctor who had administered the anæsthesia who pulled the mask off the child's face and to gether with the operating doctor prepared to resuscitate and revive the child. Artificial respiration, injections of adrenalm and massage were all attempted but the child did not respond. The defendant doctor then cut into the child's abdomen, cut the diaphram and reached up and massaged the infant's heart with his hand. He also injected adrenalin into the heart but it was of no avail and the child did not survive. The defendant doctor claimed that he had examined the child's heart and lungs when she was first brought to his office, and the hospital records also prove that the heart and hing condition was such as to permit the administration of aniesthesia Also before the second operation from which she never recovered, he had examined the infant and at that time also appeared to be normal and a safe person to whom such administration of anæsthesia could be given. Neither the doctor who operated nor the doctor who gave the anæsthesia could advance any explanation as to why the child went out under the ether anæsthesia

Thereafter, the father of the child instituted legal proceedings naming as co-defendants the doctor who performed the operation and the hospital whose agent administered the anæsthesia A general denial to all the allegations in the complaint was entered by both the doctor and the hospital The case was subsequently noticed for The counsel for the defendant prepared a defense of both the doctor and the institution The institution was eleemosynary in its nature and therefore not liable unless for gross and willful negligence

On the date that the case came up for trial, the defendants appeared with their witnesses, but Judgment therethe plaintiff did not appear

fore was entered dismissing the complaint and terminating the action in favor of both the hospital and the doctor

# LONDON LETTER

European Tour, Society of Surgeons, U.S.A.: One night this week I attended a function which formed a fitting close to a European tour undertaken by the Society of Surgeons of the United States of America. Mr. Herbert Paterson gave a reception to the travellers and their ladies, and I found myself face to face with many who had welcomed me on my visits to America. How the old questions stumble out and how eagerly we wait for the reply! Is So and So still working? Does this one still continue his delicious conversational ritual during his operations? Has that one been as seriously ill as we heard, and is he all right again? And through it all the memories flood back. One remembers one's host, not as a great surgeon with an international reputation, but as a genial giant with a gift for a good story. One mingles with a crowd of students at a great university and is surprised that they are so little different from one's own; one drives into the country as the sun is setting and the thought comes "why it is just like Hertfordshire." "When are you coming back again?" they ask me. Yes, that is the prob-We know the value of travel in other countries, but we do not do enough of it. Our holidays are short and we are too much inclined to say "Oh, let's get away from the shop for a time!" And so we pack our bag and hie away to some spot where we can forget medicine and the ills that flesh is heir to. But this meeting with old friends has roused in me the old unrest, and it may not be long before I am able to link up my old friendships.

Royal College of Surgeons: Looking at the grey stone façade of the Royal College of Surgeons in Lincoln's Inn Fields one would think that nothing had changed or could change, but the year that has passed has been a busy one. The alterations have taken place on the two upper floors, high above the Library and the Museum. These floors have been almost transformed to provide additional laboratories for research. It has long been a matter of concern to the Council of the College that they could offer but inadequate accommodation to those wishing to carry out anatomical and pathological investigations, and as they had no scholarships

many promising researches had to be abandoned. But the difficulty has now been practically over-I was fortunate enough to find Sir Arthur Keith at a moment when he could spare me a short time to show his treasures. We drifted naturally to the Museum and Sir Arthur fell to demonstrating some of the new arrivals. showed me a collection of sixteen skulls, brought from a cave in the Province of Cuzco in Peru, of Pre-Incan people who had all been trephined during life, other specimens of disease, bone disease, the liver of an unfortunate baby who died at 10 months old of melanotic sarcoma inherited from its mother who died of the disease, and many others. Sir Arthur is a fascinating guide and the time passed all too quickly, but he had to go, and I made my way up to the new depart-The alterations were completed in six months, just in time to accommodate the new research scholars, who will take up work shortly as the result of the gift of three scholarships given by Lord Beaverbrook, Lord Melchett and Mr. Bernhard Baron. These scholarships are of the value of £500 a year, and the real worth of them cannot be estimated. Taken in conjunction with the acquisition of Darwin's old home at Down, Kent, which will be developed as a School of Experimental Research, it may well be said that research at the College of Surgeons has taken on a new lease of life, and Lord Moynihan may well look back with satisfaction upon the term of his Presidency. We must all congratulate the President on his re-election to office for the fifth year, the more so as it will give him the opportunity of carrying still further his aspirations for the future of the College. One wonders whether there is any better way in which a wealthy man can help Science than in the founding of these Scholarships. The annual report of the Trustees of the Beit Memorial Fellowships for Medical Research is just to hand and makes fascinating reading. These Fellowships have now been in operation for 20 years, and originated from a gift of £230,000 by Sir Otto Beit. During these 20 years 138 Fellows, including women, have been elected, and already we find among former holders of Scholarships names which are household words in medicine.

J. M. CARSON, F.R.C.S.

### NEWS NOTES

#### COMMITTEE ON ECONOMICS

The Standing Committee on Economics of the Medical Society of the State of New York consists of the following members:

Dr. George F. Chandler, Kingston, Chairman.

Dr. E. A. Vander Veer, Albany.

Dr. Edwin MacD. Stanton, Schenectady.

Dr. William L. Bradley, Manhattan.

Dr. John L. Bauer, Brooklyn,

This committee held its first meeting on June 16, 1930 in Albany, and conferred informally with representatives of the Department of Labor of New York State, and of the insurance companies engaged in compensation work. The object of the conference was to ascertain the points of view of government officials and insurance carriers in their relation to physicians who treat injured workmen. That these relations have been unsatisfactory was shown at a public forum conducted by the Medical Society of the County of New York on the evening of Friday, February 15, 1929, an abstract of which was printed in this Journal of April 15, 1929, page 456. The subjects discussed then included the grievances of both the doctors and the insurance companies; and each party pointed out the defects of the other.

Workmen's compensation is conducted under the Workmen's Compensation Law which requires that whenever a physician treats an injured workman, certain specific duties shall be performed by physician, the State, and the Insurance Carrier. The nature of these duties are set forth clearly and concisely in an article entitled "The Workmen's Compensation Law" by James N. Vander Veer, M. D., Albany, N. Y. This article was published in this Journal on April 1, 1929, page 395.

The physicians, officials and carriers present at the conference of June 16 reached informal agreements on all the points of dispute.

It was agreed that physicians should make out the required forms of notification and report every case promptly,—especially the form called C-4; and that they would supply additional information promptly and submit their bills in an itemized form. The insurance carriers recognized the justice of the principle of a broad interpretation of what constitutes an engagement to treat an injured workman; and offered to recognize the claims of any physician who treats a patient in good faith, and complies with the requirements of the law.

In order that both the carriers and the physicians might have standards for judging disputed points, two measures were suggested:

- 1. Each County should have a voluntary committee composed of representatives of both the physicians and the carriers, which should be a committee of arbitration to settle disputes between doctors and the insurance companies.
- 2. A fee bill should be adopted, so that the carriers might have a standard by which to judge the justness of the doctors' charges. Such a fee bill was drawn up after the meeting.

The conference demonstrated that physicians, insurance carriers, and government officials are ready to develop a plan of action which shall be satisfactory to all parties; and also that every difficulty may be readily adjusted by further conferences.

The second meeting of the Committee on Economics was held on Friday, September 5, in the building of the New York Academy of Medicine, and was attended by physicians only. The tentative agreements developed at the meeting of June 16 were discussed. It was felt that these agreements should be developed in the counties of Greater New York first, and then extended throughout the entire State.

Reference was made to the fee bill proposed by the Colorado State Medical Society in dealing with cases under the Colorado Workmen's Compensation Law. This list is printed on page 816 of this Journal of July 1, 1930. It is higher than the proposed New York list in some items, and lower in others.

The committee also discussed methods of publicity, including a weekly bulletin to be sent to leaders in every County Society in order to give them prompt information of what takes place ir the State Society.

#### PUBLIC RELATIONS SURVEY NO 15-OSWEGO COUNTY

The following is a brief review of the work now being conducted in Oswego County, with special emphasis on the cities of Oswego and Fulton.

1. A city welfare station and a city welfare nurse in Oswego and Fulton are maintained to offer free service to families who need instruction in hygienic care of the home and children.

2. Closely associated with the city welfare stations mentioned are the pre-natal clinics held

one afternoon a week.

3. The county maintains a tuberculosis nurse whose duties are to visit families among whom the disease has occurred, to determine the causes, and suggest measures to correct the conditions. Hospital provision is made for the treatment of patients coming under the County nurse's observation, when such provision cannot be made by the patient's family.

4. In Oswego County the Parent-Teachers' Associations have done considerable work in supplying free milk to poor, undernourished children. They have also cooperated with the local Red, Cross Societies and with women's clubs in the campaigns against diphtheria and smallpox.

5. Every summer the County maintains a Health Camp for poor and undernourished chil-

dren.

- 6. The State maintains in Fulton a Child Hygiene Station and pre-natal clinic for the unique and special purpose of serving as a training station for State welfare nurses. In groups of four or five, nurses are sent here every three months to receive this special type of training which consists largely of giving pre-and post-natal care and instruction for mothers both at the clinic and at their homes. The work is largely educational in nature.
- 7. In connection with the training station maintained in Fulton by the State, the State sends two specialists once a month to conduct clinics for children with manifestations of mental deficiencies, and for crippled children, respectively.
- 8. The City of Oswego maintains a clinic for venereal diseases.

#### General Discussion

The County of Oswego has witnessed a general industrial depression during the past ten years. Unemployment has far surpassed that of any year before the war. The incomes of physicians have been reduced accordingly. There has been also an increase in the number of physicians in Oswego County. Much of the progress in public health work that has been made has resulted from the activities of the medical profession of the County.

Presented with this report is a statistical sur-

vey of the morbidity and mortality rates for children under one year in Oswego County, in the City of Oswego, and the City of Fulton. These were obtained through Miss Brown, who is in charge of the State Hygiene Station located in Fulton whose activities have been previously mentioned. The report shows that the mortality rates from nearly every cause have decreased in Fulton since the establishing of the State Stations. These figures are a sufficient indication of the great value of the State Hygiene Station to the City of Fulton. The people of Fulton, particularly the physicians, have cooperated in helping the State nurses and clinicians.

#### RECOMMENDATIONS

1. The work being done by the State Hygiene Station and Clinic in the City of Fulton to be continued and if possible expanded

continued and, if possible, expanded.

2. A similar station to be established in the City of Oswego with a branch station in the village of Pulaski. Such a station might be either supported by the State or County, or both.

3. The several activities in the County should be conducted with a view to bettering the cooperation between the various agencies.

- 4. Further stress should be placed on the preventive measures which are in general use now in the County.
- 5. More drastic steps should be taken in the future to insure toxin-antitoxin campaigns against diphtheria, and vaccination campaigns against smallpox.
  - 6. Require by law that all milk be pasteurized.
- 7. Greater effort should be made to improve the water supplies and sewage disposal methods in rural districts.
- 8. The excellent work being done by the County against tuberculosis should be continued.
- 9. The County should establish a Dental Clinic meeting alternately in Oswego and Fulton
- 10. The orthopedic survey should be expanded to include the entire County with a view to cooperative measures being taken between the State orthopedic clinic at Fulton, and the County, and the medical profession in the treatment and care of crippled children.
- 11. An extensive policy of publicity should be adopted to inform the people of the opportunities offered them by the various agencies at work. The importance of immunization against diphtheria and vaccination against smallpox should be stressed. Through this means only can the public soon become aware of the work that is now being done and of its great importance to their welfare and happiness.
- 12. The physicians in the localities where clinics are being held, or will be held in the future,

should offer their services for a very small consideration to be paid by the County. In this manner it is possible that a permanent service in several fields of medicine will be at the disposal of the public who cannot afford regular treatment.

Some tables of Vital Statistics are appended Frank E Fox, MD,

Chairman Committee on Public Relations and Public Health for Oswego County

#### THE BRITISH MEDICAL ASSOCIATION

The British Medical Journal of July 19 contains the announcement and program of the ninety-eighth annual meeting of the British Medical Association to be held in Winnpeg, Canada, August 26-29, in connection with the sixty-first annual meeting of the Canadam Medical Association. The two Associations have been in close affiliation since 1924. The British Medical Association has met twice before outside of the British Isles—in Montreal in 1897, and in Toronto in 1906.

The scientific meeting consists of fourteen sec-

tions, including one on the history of medicine. An Indian pageant and a skating carnival are named as special events in which the overseas doctors will be interested. The program lists the National Temperance League, the Medical Missionary Breakfast, a Military Luncheon, and a Civic Lunch.

A feature of the program is a page on "Hints on Travel in Canada." This page is an example of the attention to essential details which are found in British medical journals. The editors consider it their duty to inform the English physicians regarding matters which are done differently in America. The article states for example:

"Shoes are not placed outside the doors in Canadian hotels or private houses, but are cleaned by bootblacks in the barber shops or small bootblack shops scattered throughout the city. A hotel valet will press and clean visitors' clothes overnight. In the majority of private houses in Canada only one maid is kept, and there are therefore many small services which cannot be rendered as they are in England. Morning tea is not a custom of the country, but most guests will find they are offered it, and it can always be arranged for at the hotels.

"Nearly all rooms in Canadian hotels have connecting bathrooms, and soap is always provided in trains and hotels without extra charge. The telephone is used for rapid communication, and every firm, and nearly every private individual, has a telephone in Canada. Telegrams are never sent locally. Letters to the British Isles and the United States take a two-cent stamp.

"It is customary in Canada for women to proceed through the Pullman car to the dressing-room in a dressing-gown, and a little practice will help travellers to become quite expert in dressing, and undressing in their berths. They need have no fear of sleeping in these curtained niches; the linen is absolutely clean and sanitary, and each traveller is quite unseen by the other occupants of the car."

#### GRADUATE FORTNIGHT

There has been a gratifying response to the invitation issued by the New York Academy of Medicine to physicians generally that they attend the Graduate Fortnight conducted by the Academy, October 20th to 31st, inclusive, as described on page 1056 of the September first issue of this Journal. Admission tickets to the afternoon clinics listed on the program are likely to be exhausted unless applications are made promptly; but the Academy will supply information regarding similar clinics to be held in other hospitals besides those on the regular program.

The afternoon clinics and the evening lectures of the Graduate Fortnight are free to all physicians.

The information service of the New York Academy of Medicine regarding opportunities for graduate study is unique. New York City is a great medical center where physicians from all over New York State and the nation are welcomed with cordiality. The services of the Academy are well known to all physicians living in the Metropolitan area; but they are equally at the disposal of visiting physicians.

# THE DAILY PRESS

#### CHILD PSYCHOLOGY

Briggs in the New York Herald Tribune, March 30, 1930

Briggs in the New York Herald Tribune, September 5, 1930

#### ILLNESS A NATIONAL PROBLEM

Ex-President Coolidge usually writes three paragraphs daily for the New York *Herald Tribune*, but on August 11th he wrote four on good health, as follows:

"Good health is one of our chief national assets. Yet, in spite of all the progress that has been made in the science of hygiene, the yearly losses in this country from the ravages of disease run into many hundreds of millions of dollars.

"The discouraging feature of the situation is that much of this is needless. With the present knowledge of medicine, surgery and dentistry and the possibilities of preventive measures, oftentimes illness is only personal carelessness.

"People give altogether too little attention to

their health. They neglect to get sufficient fresh air and exercise. They are not careful enough They overstrain their physical of their diet. and nervous systems, with disastrous results.

"Because illness makes us a liability to ourselves, our family and our community, we all have a personal obligation to keep well. neglect the health is one of the most wasteful things a person can do. It is a violation of a While both state and national moral duty. agencies are alert to preserve health, the real success of all their efforts lies in the vigilance of the individual. If we would all think and try to live healthful lives we would greatly increase the power of the nation."

#### UNBURNABLE MONEY

Doctors with an inclination to economic problems will be interested in the following editorial comments in the New York *Times* of August twelfth:

"The claims put forward for Germany's new currency are hauntingly reminiscent of the boasts of collar advertisements: 'Will not wilt, crack, shrink or wrinkle.' The new paper money, it is said, will not burn, tear or crumple.

"The money will be made non-inflammable by spraying it with a metal. If it becomes the general fashion to fireproof paper money in this way, some of our most cherished expressions

will have to go. The rich will no longer have 'money to burn,' and the extravagant will not be able to offer the excuse that their money 'burns a hole in their pockets.' And to 'run through money' which is non-tearable would be impossible.

"The new issue will be ready some time this Fall. Germans armed with a wad of bills that will not burn, tear or crumple may find their money lasting well, even under the wear and tear of a Christmas shopping season. But perhaps money will yet have to be made non-spendable."

#### THE DEAF AND DUMB

The New York Times of September 8 carried the following editorial which will be of practical interest to physicians:

"Those who live in the world of which Helen Keller is the best known to the seeing and hearing are estimated to number more than 2,000, including those who have lost both sight and hearing in age. There are 715 of the Helen Keller type in the United States and Canada, though few, if any of them, have had the fortune to be led by the hand of such teachers as she has had.

"Deaf-blind pupils are refused, generally, by schools for the blind on account of their deafness and by schools for the deaf on account of their blindness; so they are left in their would of darkness and silence, with no sensory guides except touch, vibrations, taste and smell—and the kindly leadings of members of their families.

"The teachers who can instruct this most neglected class in the whole civilized world must be of the most highly qualified type. It used to be said of Mrs. Macy that the marvel of her communicating with Helen Keller's mind was as great as that of her pupil's response.

"A report recently made by two experts under the auspices of the Volta Bureau for the Deaf recommends that there should be a national institution exclusively devoted to the general welfare of the deaf-blind, and that each State commission for the blind should make it its special duty to avail of such help and advice as this central 'clearing house' can give and then see to it that its own doubly handicapped are delivered from the 'all-devouring dragon of loneliness.' Some are mistakenly placed in institutions for the feeble-minded simply because their minds have not been reached."

#### RABIES IN NEW YORK CITY

The New York Times of September 11 has the following instructive editorial on rabies:

"A little girl died of rabies in Brooklyn last nonth. She had been bitten in the face by a stray dog a few weeks earlier. Unfortunately, the wound was not cauterized with nitric acid, and, despite urging by the Health Department, the child was not given anti-rabic immunization.

"The case is the only human fatality due to rabies recorded in this city this year. Last year and the year before there were two deaths, in 1927 six, in 1926 one.

"Every year thousands of persons are bitten by dogs, and the department does its best to check up on each case. With an average of about twelve thousand bites reported annually, 465 dogs were found rabid in 1927, 255 in 1928, 157 in 1929, and 56 so far this year.

"Rabies remains a real danger, the department declares in its latest bulletin, though fortunately the number of dogs found rabid seems to be decreasing. Prompt canterization with fuming nitric acid is regarded as even more important than immunization."

# BOOK REVIEWS

POSTURE AND HYGIENE OF THE FEET. By PHILIP LEWIN, M.D. 16mo of 47 pages, illustrated. New York and London, Funk & Wagnalls Company, 1929. Flexible leather, \$.30. (National Health Series.)

"Posture and Hygiene of the Feet" is one of the National Health Line of booklets sponsored by the National Health Council composed of the leading health organizations of the country. Philip Lewin is a most practical sort and has incorporated in this book a great mass of common sense thought about foot care and comfort. You wouldn't think it could be made interesting, but that is exactly what he has done. There isn't a paragraph of superfluity, no long verbiage of theory, just the thing for laymen or physicians who wish to add a few more orderly arranged facts to their storehouse of useful knowledge.

Donald E. McKenna.

An Introduction to the Study of the Nervous System. By E. E. Hewer, D.Sc., and G. M. Sandes, M.B., B.S. (Lond.). Octavo of 104 pages, illustrated. St. Louis, The C. V. Mosby Company, 1929. Cloth, \$6.50.

In this volume the authors have attempted to present the principles of neuro-anatomy and physiology as an introduction for students and physicians interested in learning clinical neurology.

The first portion of the text deals with the microscopic anatomy of the spinal cord and brain. The second part deals with the physiology of the central nervous system. There is also a chapter on the cerebrospinal fluid.

The text is abundantly filled with diagrams, illustrating the various anatomic facts. Detailed discussion has been purposely omitted to avoid confusing the student. The aim throughout has been simplicity and directness.

For the student or physician interested in a reference text to refresh his memory on the elemental anatomic and physiological considerations of the central nervous system, this work is admirably suited.

STANLEY S. LAMM.

AIDS TO DERMATOLOGY AND VENEREAL DISEASE. BY ROBERT M. B. MACKENNA, M.A., M.B. 16mo of 236 pages. New York, William Wood and Company, 1929. Cloth, \$1.50.

This book of 236 pages is distinctly a pocket edition designed to give a few of the highlights of dermatological and venereal diseases. There are about thirty-five pages devoted to venereal diseases, two of which deal with chancroid, five with gonorrhea, and the balance with syphilis, including congenital syphilis, tabes and paresis.

E. Almore Gauvain.

Synopsis of the Practice of Preventive Medicine As Applied in the Basic Medical Sciences and Clinical Instruction at the Harvard Medical School. Octavo of 194 pages. Cambridge, Harvard University Press, 1929.

This book is based on the course of preventive medicine as given at the Harvard Medical School. Its method of presentation is rather unique in that it deals with every conceivable specialty as units, and tells the student what each can offer from the standpoint of prevention.

thus not the especially encouraging features is that it thus not where the student's time with meaningless hypo-

thetical preventive measures which only serve to engender in him an unwarranted skepticism. For example: "We have too little accurate data as to the causation of the chronic diseases and consequently we are more at a loss when it comes to considering their prevention"—or—"Owing to our ignorance of the etiology of the various malignant diseases our prophylactic measures are of necessity purely empirical." And so the student is introduced to the truths of medicine without introductory apologies.

There is just one paragraph, namely, on the topic of Status Lymphaticus, which is not entirely clear to the reviewer. Routine x-ray examinations of the chest are recommended to all children under twelve before being anesthetized, in the hope of discovering large thymus glands and thereby reducing them by x-ray therapy. Are large thymus and status lymphaticus identical?

EMANUEL KRIMSKY.

A TEXTBOOK OF THE PRACTICE OF MEDICINE. By Various Authors. Edited by Frederick W. Price, M.D. Third Edition. Octavo of 1871 pages. London and New York, Oxford University Press, 1929. Cloth, \$11.50. (Oxford Medical Publications.)

This edition brings up to date an excellent work on the practice of medicine including sections on the diseases of the skin, diseases of the nervous system and psychological medicine. Although the book contains 1871 pages, the use of thin paper makes the volume of convenient size. Many new articles have been added, among them Lead Tetra Ethyl Poisoning, Basal Metabolism, Vitamins, Megacolon in Adults, Thrombo-Angiitis Obliterans, and a number on affections of the heart and kidney. The section dealing with clinical electrocardiography is quite full for a general work.

There are undoubtedly many advantages in having different writers participate in a book which is as wide in scope as this one, which contains a wealth of information and justifies the opinion of its editor that it will continue to be a credit to the London School of Medicine.

W. E. McCollom.

THE TREATMENT OF VARICOSE VEINS OF THE LOWER EXTREMITIES BY INJECTIONS. By T. HENRY TREVES-BARBER, M.D., B.Sc. 12mo of 120 pages. New York, William Wood and Company, 1929. Cloth, \$2.25.

It is refreshing to have offered to us, from an English source and from a London viewpoint, the story of the injection treatment of varicose veins. The author, in a monograph of about 120 pages, covers the entire subject from the anatomy of the disease to the complications of treatment.

The entire exposition is characterized by temperate statements and justifiable conclusions. We believe that he has repeated the errors of his forbears in some of his statements on the physiology of circulation in varicose disease. His deductions on the relation of varicose veins to septicemia perhaps would not find acceptance among gynecologists.

His therapy by the injection method is practically limited to the use of one solution, sodium chloride. He does not pretend to tell the results of therapy by other methods, although he mentions them in passing. His enthusiasm for the treatment has enabled him to produce a treatise which reads well and which is convincing.

ROUERT F. BARBER

A MANUAL OF MIDWIFERY FOR STUDENTS AND PRACTITIONERS BY HENRY JELLETT BA MD, and DAYID G MADILL, BA, MB BCh Fourth Ldition Octayo of 1281 pages, illustrated New York William Wood and Company, 1929 Cloth \$10.00

A book of over 1200 pages to be reviewed properly demands pages instead of paragraphs and the reviewer in this instance can but point out that this taxbook is thorough to a degree, well illustrated and affords easy and interesting reading. The illustrations for the most part are good and line drawings play a promittent part

Naturally, some of the methods advocated and some of the treatments proposed will not meet with universal approval

That, however, is true of any book worth-

The reviewer feels that this edition must be in the hibrary of every specialist, and can carnestly recommend it to the student if for no other reason than for the chapters dealing with the physiology of pregnancy, labor and puerperium GWP

Aibs to Orthopedic Surgery By Eric A Crook, MCh, FRCS I6mo of 232 pages illustrated New York, William Wood and Company 1929 Cloth, \$150

As a youth quiz compends were highly esteemed, as a senior it is difficult to appreciate their value. However the great accumulation of ficts of which the medical student must become cognizant in order to obtain his degree of necessity demands certain short cuts. As such an abbreviation the reviewer has no quirrel with this manual. It presents an excellent arrangement of subjects enlarging on the more important and classifying them logically.

OUTLINE OF PREVENTIVE MEDICINE FOR MEDICAL PRAC TITIONERS AND STUDYNTS Prepared under the Aus pices of the Committee on Public Health Relations, New York Academy of Medicine 12mo of 398 pages New York, Paul B Hoeber, Inc, 1929 Flexible leather, \$\$ 00

This is a book that every physician should get, read, annotate and keep for reference in the second of medical diagnosis arranged in departments written by specialists who clearly display not only their own fields as specialists, but they present their chief interests in relation to the affairs of the whole body. This gives ground for the hope that specialism in medicine is be coming less egocentric and more catholic.

The book treats of preventive medicine. This is perhaps the first successfully to do so, for standard books on 'Preventive Medicine' are devoted largely to saintation. The volume published by the Medical Society of the County of New York on the 'Periodic Health Examination 1925 was the pioneer of the modern movement and the prototype of the prevent volume. But although it reached all the members of the Medical Society of the County of New York it was not placed on the general market and it his now become largely of listorical interest. The volume by Fish and Crawford on "How to make Periodic Health Examinations' by MacMillan in 1927 has less clinical discussion but much more about the practical method of conducting a Health Examination

The pamphlets of the Kings County Medical Society, the Massachusetts State Medical Association (Garland) and the American Medical Association have given good service in the premises. The present volume gives announcement and pledge of the fact that the epoch of preclinical medicine is here and going forward. Its progress is assured by the increasing knowledge of the public in the fields of medical foreight, and the demand

of the public on the medical profession for this service in a modern manner

Medical practice changes perceptibly with each decade The advance is continual and fluctuating, but sure M'uny if not most physicians are continually left a little or more than a little behind Some get too far ahead and others, of course, stray

For those who would keep in line and go forward a study of this volume will give a vision of the new preclinical point of view and some instruction in its method C WARD CRAYPTON

HYPERTENSION AND NEPHRITIS BY ARTHUR M FISH-BERG M D Octavo of 566 pages illustrated Phila delphia, Lea & Febiger, 1930 Cloth, \$6 50

The author has presented an excellent resume of our present knowledge of hypertensive and renal diseases and supports his statements by a careful hibliography at the end of each chapter. This is a valuable feature of the book as the literature of the subject is extensive and scattered.

In the opinion of the author the simple specific gravity test is the best method available at present for studying the functional capacity of the kidneys and a simple tech inque of applying the test is given which can be easily used outside of the hospital

The term 'hypertensive encephalopathy' is used to include the group of cerebral phenomena as headache convulsions coma, and other evidences of focal or diffuse disturbance of the brain. This cerebral symptom-complex is stated to be correlated with arterial hypertension and not always with glomerulo nephritis or uraemia. The primary pathogenetic factor is believed to be the cerebral anemia resulting from arterial contraction. Edema of the brain may or may not be present

The subject of hypertensive retinities is fully discussed and the description of essential hypertension is particularly good

The author has previously written some excellent ar ticles dealing with these subjects and the present volume is a sound and comprehensive treatise

W. E McCollon

THE CARE OF THE NOSE, THROAT, AND EAR. By W STUART LOW FRCS, Eng Second Edition 12mo of 88 pages illustrated London, Bailliere Tindall & Cox, 1929

This handbook of but 88 pages discusses in elementary fashion the structures and functions of the nose, throat, and ear, as well as their clinical applications. It also deals with certain theoretical topics of a controversial nature, and quotations from the text may best serve to illustrate them

- 1 'Many people blow the nose improperly. They pull the nose about with the handkerchief and so tend to deform it'
- 2 In the treatment of nasal catarrh there is one practical point to be noted, viz, with regard to handkerchiefs, those made of paper should be substituted for the usual linen handkerchief
- 3 'Hay fever is very common in America where the habit of heating the air in houses is usual"
- 4 'The large majority, if not all cases of astlima, are dependent upon some obstruction or disturbing condition of the nasal cavity'
- 5 For the prevention of throat ailments it is most important to attend to the cleansing of the teeth tooth powders are not so good as some of the powder is liable to be inhaled and so irritates the throat"
- 6 If the hair has been lost a nighten should be worn. Its use helps the crannil circulation warms the head and is a distinct assistance in overcoming head noise. 7

#### ANNUAL MEETING OF THE MEDICAL SOCIETY OF NEW JERSEY

The annual meeting of the Medical Society of New Jersey held on June 11-14, is discussed editorially in the Society's August Journal as follows:

"The recent Annual Meeting of the State Medical Society was highly successful in many respects, and only to a very limited degree is there anything about which to complain.

"The failure to hold a scheduled Saturday morning session, due to inability to raise a quorum, was unfortunate because it necessitated passing on much work to the Board of Trustees that should have been performed by the Delegates. It does look as if it would be wise to abandon efforts to hold a final session on Saturday, and to have an extra meeting of the House of Delegates late Friday afternoon to complete the business transactions of the convention.

"General attendance was also disappointing this year. Through each of the past six years there has been a steady increase in registration of attendance, until it had exceeded 1,000, but this year there was a marked falling off—the total being something more than 800, and the number of member-physicians but 388 as compared to 500 at the 1929 meeting. Various reasons may be given in explanation of this decrease of more than one hundred, but we fear that one of the principal reasons is to be found in verification of the prediction that abolition of "permanent delegates" would have that effect.

"Why is it that one county was represented by only two members; another by three only; and these counties not the most distant ones from the place of meeting? When one con-

siders the amount of time, thought and energy put into preparation for the annual convention and the excellence of the program arranged; and, further, considers the fact that the convention deals with a series of problems that vitally affect the professional and business success of each and every member; an attendance of only 15% of the entire membership needs an explanation, and the attendance of so small a number from even the smallest county in the state (measured by number of physicians) seems inexplicable. Have the majority of members so little interest in these annual meetings as scanning of the registration list seems to indicate, or, are they so well pleased with the conduct of the society and the work of its officers that they are satisfied to leave complete management of their affairs to the few who more or less regularly attend?

"Within a few days after adjournment of the 1930 convention, the new President, Dr. George N. J. Sommer, had announced the appointment of all Standing. Committees for the next fiscal year. Dr. Sommer has also inaugurated the plan of inviting all three of the Vice-Presidents to attend regularly all sessions of the Welfare Committee. For several years past the First Vice-President has been regularly included in the Tri-state Medical Conference, and recent Presidents have frequently. but irregularly, invited their representative First Vice-Presidents to other important meetings or to joint visits to county societies, but President Sommer is taking a further step in advance for training the men 'in line' to prepare for duties likely to fall some day upon their shoulders.'

#### ACTIVITIES OF THE IOWA STATE MEDICAL SOCIETY

The annual address by Dr. J. H. Peck, President of the Iowa State Medical Society, at the seventy-ninth annual session on May 14-16, which is printed in the June Journal sets forth what the president considers the major activities of the Society, and says:

"The House of Delegates last year authorized the organization of a Woman's Auxiliary to our State Society. A goodly number of counties have organized and arranged inter-

esting, worthwhile programs. The Auxiliary can render valuable assistance, especially politically and legislatively, and deserves our support and encouragement.

"The fine spirit of cooperation with the Iowa Federation of Women's Clubs has culminated in a contest between their districts for the highest percentage of their members who have had periodic health examinations during the current year. This attitude on the

# The Physician's Gymnasium

M cGOVERN'S is often referred to as "the physician's Gymnasium" because so many doctors send their patients here. Through investigation, they have found that McGovern's is the one gymnasium that bases its exercises and athletics solely upon the physician's diagnosis of the patient's individual condition.

We'll be glad to send any physician a guest card so that he may see, for himself, our facilities for carrying out his orders.

jovern's (for men and women) 41 East 42nd St., at Madison Ave. New York City

(Continued from page 1130)

part of 60,000 Iowa club women has attracted a vast amount of favorable comment and should be a mighty stimulating factor in the more general acceptance of this approved project of our National body. A more simplified, standardized examination blank and an adequate, uniform fee will do a great deal to promote an annual physical check-up of all

their membership. "The responsibility for lay health education through a speakers bureau, news service, radio broadcasting, etc. belongs to our Society. The speakers bureau has already begun to function in a limited way but, with a departmental secretary soon to be placed in charge, it promises to become a very important feature of our work. Physicians in the past have neglected a real civic duty—that of dissemination of scientific, medical knowledge through recognized ethical channels of education. The trained voice has a wonderful opportunity. We have planned to supply speakers on various medical and health subjects, furnishing them outlines of speeches and visual aids; such as maps, charts, lantern slides and movie reelsin fact everything except the voice.

"Several series of articles on health topics to be furnished the lay press are in process of This avenue of education has preparation. been used to some extent in our State but the educational value in the mind of the public has not been appreciated. This material is to be so carefully edited and distributed that no objection to its use may possibly arise. Radio broadcasting has been so abused that, until the air is entirely cleared of the present vicious advertising from certain stations, scientific medical talks should not be broadcast. Lay people are becoming more 'health conscious' and we must be prepared to do our part in

directing their medical education.

"We are enjoying unusually pleasant relations with the official bodies of our State, namely: The State Department of Health and the State University, College of Medicine, as well as the numerous voluntary organizations which have a more or less definite health pro-These contacts are so important that there should be a special committee constituted to preserve and foster this favorable position of leadership. Thus, a Public Relations Committee in the State Society should be the liaison agency to actively direct all health programs, preventing duplication of effort, broadening the scope of preventative medicine and making medical science the basis of health propaganda.

"Another proof that the modern physician will not be satisfied with abstract generaliza-

(Continued on page 1133-adv. xiii)

(Continued from page 1132-ad- ru)

tions drawn from an abundant literature is the unprecedented success of post graduate medical education in the recent demonstrations at Waterloo and Mason City Clinical instruc tion has proven so popular in Iowa as else where, that a very serious problem has arisen as to how the demand can be met Our State University must refuse the increasing number of requests for medical extension owing to the lack of trained personnel, which really means lack of finances to provide highly qualified teachers for extramural post graduate courses, and at the same time carry on the required under-graduate instruction and care for the patients in the University Hospital We have started something which we are under moral obligation to finish This very obvious desire on the part of the general practitioner to profit by instruction in the advances of medical science is most encouraging, and if he will accept it so eagerly when brought to him and served in an attractive manner, some means must be devised whereby these courses shall be continued, and eventually enlarged Such service is not an experiment but a thoroughly proved The State Society has here an out standing opportunity to advantageously expend a portion of their surplus funds

"The chest clinics conducted so extensively for more than ten years by the Iowa Tubercu losis Association afford a splendid illustration of a valuable and appreciated contribution of a voluntary health agency to the Iowa physicians. More than three hundred such clinics have been held and more requests are now received than can be filled with the limited, available funds and the present staff of clinical control of the present staff of clinical

cians "

#### A DISTRICT SOCIETY MEETING IN KENTUCKY

The first article in the Kentucky Medical Journal of July is an account of a district meeting which reads as follows

"Those county societies whose interest is waning would do well to have their secretaries attend one of the meetings of the Cumberland Villey Medical Society, which embraces the counties of Laurel, Whitley, Bell, Kno, and Harlan In these counties there are 106 doctors of whom 86 were present at this meeting

"Through the untiring efforts and leader-ship of its president, Dr J G Foley, and its secretary, Dr O P Nuckols both of Pineville, one of the best and most inspiring meetings of this association was held in Williamsburg and Corbin, on May 7th—In preparing for

(Continued from page 1133-adv. xiii)

this meeting, the officers cooperated with the Young Men's Christian Association in Corbin and supplied a speaker on Public Health in every school in Corbin. In Williamsburg prior to the meeting, a speaker addressed the Cumberland College and the graded schools on the prevention of Scarlet Fever, and as a result of this, 800 students volunteered the Dick Test for Scarlet Fever. Free posters were distributed in both towns advertising the Scarlet Fever Clinic and the Heart Clinic.

The program included a demonstration of the Dick Test for Scarlet Fever and a Heart Clinic for the students of Cumberland College at which 650 cases were examined. The ac-

count continues:

"A ten-course dinner was served in the Gentry Hotel and Dr. J. G. Foley gave the presidential address. The society then reassembled in the Christian Church and Drs. Hayes Davis and Irvin Abell, of Louisville, discussed the medical and surgical treatment of ulcer. Drs. E. F. Horine and O. P. Nuckols gave a lantern-slide talk on heart disease, followed by exhibition of six cases showing various heart lesion. Dr. L. L. Terrell, of Corbin, gave a very fine paper on 'Jake Leg,' assisted by physicians in Corbin. These physicians have had more cases of 'Jake Leg' paralysis due to Jamaica Ginger than any other physicians in the United States. They exhibited 15 clinical cases and it was most distressing to see these fine young men partially paralyzed over night from drinking this abominable concoction.

"Through the courtesy of Parke-Davis Company, of Detroit, two moving pictures were shown on the preparation of biologicals on a

day-light screen.

"Dr. J. D. Allen, of Louisville, gave a most interesting chart demonstration of the new Schilling Blood Count. This blood count is probably one of the most valuable contributions to clinical diagnosis that has been discovered in recent years, and so favorably impressed were the doctors with Dr. Allen's talk that they requested he present this paper at the State Meeting in Bowling Green."

The Woman's Auxiliary is described as follows:

"Mrs. Buck, the president of the Whitley County Medical Auxiliary, was hostess of the day. The meeting was called to order at the residence of Mrs. H. H. Tye, with 35 members present. In honor of Mrs. Irvin Abell and Mrs. Hayes Davis, a luncheon was served at the Gentry Hotel, after which the ladies of Williamsburg arranged an automobile ride through the Narrows to Jellico, Tenn., where

(Continued on page 1135-adv. xv)

(Continued from page 1134—adv. xiv) a tea was given by Mrs. Harkness and Mrs. Hefferman."

An evening banquet was described as fol-

lows:

"At 6:30 o'clock a motor cavalcade composed of the Mayor and City Commissioners of Corbin, arrived in Williamsburg to escort Dr. and Mrs. Irvin Abell, Dr. and Mrs. Hayes Davis, Dr. E. F. Horine, and Dr. J. D. Allen, to Corbin, where a banquet was served to all the visiting physicians. Dr. Abell addressed the citizens of Corbin and Cumberland Valley Medical Society at the Hippodrome, on the 'Value of Public Health.' A 75-piece orchestra, composed of the young men and women from the various schools of Corbin, also gave a musical program.

"The fine attendance at this meeting in which the public of both Williamsburg and Corbin participated, demonstrates that if any secretary will give the time and labor to arrange a good meeting as did Doctors Foley, Nuckols, Moss and Terrell, scientific medicine and public health will reach every fireside in

Kentucky.

"After the meeting Mr. and Mrs. Calvert, of

Corbin, entertained the visiting guests untithe Louisville train left at 12:30 A. M.—'The end of a perfect day.'"

#### TRI-STATE CONFERENCE, OPINION IN PENNSYLVANIA

The August issue of the *Pennsylvania Medical Journal* gives the following editorial opin ion of the Tri-State Medical conference held in Philadelphia, on May 24, and reported in the NEW YORK STATE JOURNAL OF MEDICINE of July first:

"The subject for discussion was 'Medical Practice Acts, State Boards, and Licensure in the Healing Arts.' The paper was presented by Dr. Ross V. Patterson, dean of the Jefferson Medical College, and was based upon nearly 25 years of daily experience and contact by Dr. Patterson with these various activities.

"As stressed by Dr. Patterson, state boards of medical examiners are not well constituted or organized to direct medical education, but their function appears to deal with the granting of licenses, prosecuting, discipline, etc. It

#### LEDERLE LABORATORIES

INCORPORATED

New York

(Continued from page 1135-adv. xv) would seem that the time is ripe for a revision of the medical acts governing all the state boards of medical examiners and their organization. The medical profession must take a very active part in these revisions and reor-

ganizations. "Dr. Patterson states 'that professional boxing is better regulated in the Commonwealth of Pennsylvania than is the practice of medicine, and that considerably more money is at the disposal of the boxing commission for the enforcement of its regulations than is placed at the disposal of the board of medical exam-

"In regard to reciprocal relations existing between state boards, Dr. Patterson believes that 'the issuance of a license should depend upon the qualifications of applicants; and not the existence of an agreement the results of a bargain between two boards. Bargaining with consequent retaliatory measures of reprisal is unfair to applicants and not in the interests of the public welfare.' The deplorable condition now existing between Pennsylvania and New Jersey for the past several years was cited, and the hope was expressed that the Pennsylvania Board would soon find a way to eliminate this unfortunate situation.

"It was of particular interest to the Pennsylvania group to hear Dr. John E. Jennings of Brooklyn state, 'that of the boys who come to us for internship and for practice, those who are the best educated and properly trained come from Philadelphia.' This is a great tribute to the medical schools of Philadelphia.

"It is also of interest to note in the discussion of the paper, almost unanimity of opinion of almost all the featured topics. The Grievance Committee of New York State has shown commendable results, and such a committee surely should be operative in all states."

#### EXCHANGE OF ADVERTISEMENTS IN WEST VIRGINIA

The West Virginia Medical Journal of July contains the annual report of the officers of the West Virginia State Medical Association. That of the Committee on Professional Relations described an advertising campaign as follows:

"About four years ago the Kanawha Medical Society and one or two other county societies throughout the state engaged in a newspaper advertising campaign upon what we called the 'Pay Your Doctor First' idea. This campaign was fairly successful. Kanawha Medical Society inserted a quarter-

(Continued on page 1137—adv. xvii)

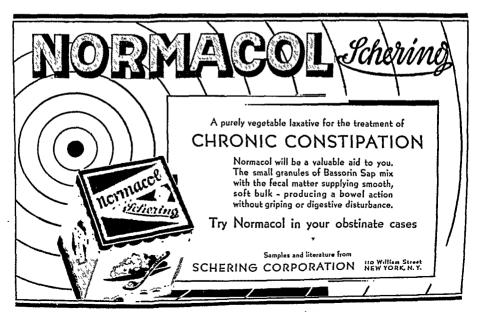

(Continued from page 1036-adv. xvi)

page advertisement each Sunday in the Charleston Gazette for a year, asking the general public to take care of their doctor bills along with their other financial obligations. I think the other county societies followed the same plan. The only objection to the plan was the rather excessive cost for the newspaper advertising campaign, which was paid through a proportionate assessment on each doctor. When the time came to collect for the advertising it was decided not to continue the campaign further."

From this experience the State Society developed a unique plan of the exchange of advertisements with other Journals, which is described as follows:

"We started to work on this same plan with the idea of transforming it into a state-wide campaign. The two publications having statewide circulation are the West Virginia Review and the Wild Life League Journal, West Virginia Wild Life, with a combined circulation of approximately 50,000 copies per month. Mr. Savage approached both of these publications on the subject of an exchange of advertising space with the West Virginia Medical Journal. Both publications were agreeable to such an exchange, and the rest was easy. We simply prepared our advertising copy for the Review and the Wild Life journal and sent it in. It now runs regularly in these two magazines, and, in return, the West Virginia Medical Journal carries Review and Wild Life advertisements in whatever space is available.

"The question might arise as to just what is the worth of such an advertising campaign. The very nature of this question implies that the campaign does have some worth. If it does have merit, then it is worth while, for it doesn't cost the doctors anything and it doesn't cost the Association anything. The advertising space given up by the Journal is known as 'filler' space; i.e., the space that is left over after all paid advertising is inserted. Your committee feels that the campaign has considerable merit, and that this service to the profession is well worth while."

## PREVENTION OF DIPHTHERIA IN NEW JERSEY

The July issue of the Journal of the Medical Society of New Jersey contains an announcement by the New Jersey Committee for the Prevention of Diphtheria that the Committee would disband after three years' work; and would recommend that the immunizations be turned over to family doctors, and that emphasis be placed on the preschool child. The announcement reads:

"The Committee has developed, as a means of carrying on its work, a statewide organization composed of a group of interested and representative physicians as chairmen of units in each of the twenty-one counties. It would seem a needless sacrifice to allow these committees to disband without in some way making use of them in continuance of the immunization program in New Jersey.

"The big point appears to be the working out of practical ways among physicians themselves for applying these protective methods in their own or in group practices. This committee, therefore, definitely recommends to the State Medical Society that it formulate through the county medical societies a plan whereby they, in cooperation with the county committees established by this organization, shall combine to keep this problem constantly before the profession and, by studying methods applied in other states and large cities, work out methods in New Jersey which will enlist the active support of every open-minded physician in the State. If clinics be found necessary, let the county societies organize and man them.

"The educational activities carried on by the twenty-one committees and the local units established by them must also be continued. These efforts must, as in the past, be actually conducted in local communities. No central state committee or other state agency can with propriety undertake to promote a local program, though it may render valuable assistance both in initiating and suggesting plans and in providing actual help. No effort, however well-meaning and useful it may be, which is carried on strictly by physicians, will meet the need. A constant stream of educational publicity must be promulgated and to that end the following is suggested:

"A certain amount of literature on prevention of diphtheria—pamphlets, circulars and posters—remains in the possession of the committee either at its central distribution office, 21 Walnut Street, Newark, or in some of the county headquarters. It is recommended that such of this material as carries only the name of the State Diphtheria Committee or other non-commercial organization be forwarded to the State Department of Health for such use as it may deem wise and that the balance be distributed to selected local health de-

(Continued on page 1139-adv. xix)

(Continued from page 1138-adv 12111)
partments which could be expected to dispose of

it advantageously."

A letter to be sent to each physician by the State Department of Health was prepared by Dr. H. O. Reik, Executive Secretary of the Medical Society of New Jersey. The letter says:

"The committee had become convinced that immunization of the pre-school child is the point at which efforts for successful control of diphtheria must now be applied. This can only be effectively done, without resort to extension of public clinics, through physicians in private practice. In terminating its active campaign, the general committee is definitely placing responsibility for protecting pre-school children in the hands of family physicians. Immunization of school children has already been accepted by educational authorities as routine practice, and the State Health Department, together with local departments and interested agencies, school people, voluntary health workers, nurses and others, is being asked to continue the educational campaign, encouraging parents to bring children to doctors for this treatment. Our obvious duty as physicians is to be prepared now, not only to apply immunization procedures but to urge in every suitable way that our clients have their children protected in this manner. The state-wide campaign committee believes that it has accomplished the task assigned at the organization meeting and should now gracefully retire, leaving final abolition of the disease to physicians and their own organization."

## FUNCTIONS OF THE WEST VIRGINIA MEDICAL JOURNAL

Dr. W. E Vest, President of the West Virginia State Medical Association tells of the functions of a State Medical Journal in the President's page of the June issue of the West Virginia Medical Journal, as follows:

"The functions of a state medical journal differ considerably from those of a purely scientific periodical. It should, of course, present the original work of the membership; but this, especially in a state of small communities and few medical centers, is necessarily of limited

volume.

"Probably the greatest value to the profession it serves lies in the fact that it affords a medium of expression for the membership of the local component societies. It is true that much of the matter presented at the county meetings is of no specific permanent worth, but if the author realizes that his effort stands a reasonable chance of appearing in print, he studies his subject much more thoroughly and is decidedly more careful in his

#### MEDICAL SOCIETY DISCI-PLINE IN RHODE ISLAND

The report of the Secretary of the Rhode Island Medical Society to the House of Delegates printed in the July issue of the Rhode Island Medical Journal, describes an unusual case of disciplining a member of the Society. The charges were that the member testified in three suits of malpractice brought by patients against three physicians. The doctor in two instances gave testimony as an expert in orthopedic surgery, but in the third case the court rejected his claim to be an expert. It was further alleged that he made repeated examinations of one patient without the attending doctor's consent.

After the County and State Societies had investigated the case, the doctor under charges wrote the following letter to the council of the State Medical Society:

"Having heard the charges preferred against me by other Fellows of this Society of unprofessional and unethical conduct toward them, I take this means of expressing my regret for entering into the cases. I admit it was injudicious for me to have entered into these cases.

"In the case against Dr. R....
my sympathy for the man, I
now believe, misled me. In the
case against Dr. W. in the light
of knowledge subsequently obtained, I know I was wrong. In
the case against Dr. F., I sincerely believed that the patient
was sent me in the proper manner by the U. S. Veterans'
Bureau, Medical Department,
but I as freely admit that the
subsequent taking of x-rays was
improper.

"To give further assurance to this Council, I will promise not to allow myself to appear in Court unless subpœnaed by the Court, and in that event I will not allow myself to be qualified as a medical expert, e-cept in x-1ay. I further agree that if I

POLAND SPRING COMPANY

Dept. C 680 Fifth Avenue New York City fail to observe any of these promises I shall be automatically dropped from membership in the Rhode Island Medical Society."

The Council met on April 25, 1930 and unanimously took the

following action.

"Resolved, that Dr. K. (the defendant doctor) is found guilty of the charge of unprofessional and unethical conduct as preferred by the Woonsocket District Medical Society; that the Society censure Dr. K for said conduct; that Dr. K's further membership in the Society be made contingent upon the observance of the promises made in his letter to the Council; and further recommends that a digest of the proceedings of the Council be published in the Rhode Island Medical Journal as part of the proceedings of the Society."

## GROUP INSURANCE IN RHODE ISLAND

The August number of the Rhode Island Medical Journal contains the reports of several officers, presented at the annual meeting on May 21, 1930. The Committee on Group Insurance reported as follows:

"It would seem desirable, if such is the situation, that this Defense Committee be reappointed, with not only competent membership, but also a membership who would be interested in this large field of activity, and that it begin active functioning.

"Recent experiences of one of our District Societies might have had a different history had such a committee been in active service during past time.

"We learn from the I. S. Fidelity and Guaranty Company that 124 of our members are now tovered by the Group Insurcovered by the number is a ance. While this not represent beginning, it does not represent the number of our members who then tumber of our the from the fidelity of the fide

## A BUILDER THAT IS EFFEC-TIVE AND PALATABLE

With the better understanding of the physiologic functions and the chemistry that has developed during the past 10 or 15 years has come the realization that in a great many conditions therapy should aim at building up, at supplying nature with the various building stones she may lack, rather than at the whiplash effect of pharmacal dynamic action. One of the best builders of its type is known as Olajen, which furnishes essential mineral salts in combination with lecithin, the importance of which in intermediate metabolism is being more and more appreciated. Moreover, Olajen has a very definite advantage over other calcium applications because it actually has a deli-cious taste. Its unusual form like a creamy fudge with a delightful pep-permint flavor makes Olajen a particularly appropriate prescription for children and nervous patients who take it practically as a pleasant refreshment rather than a necessary and therefore unpleasant medicine.

The manufacturers, Olajen, Inc., 451 West 30th Street, New York City, will send complete literature and a full-size 8-oz. jar for clinical trial on request. See page xiii.—Adv.

## AMPOULES PHYSIOLOGICAL BUFFER SALTS

(Hartmann's Solution)

In disease, factors may operate in such a manner as to overcome the acidbase regulatory mechanism and lead to serious changes in the body fluids which are often spoken of as acidosis, alkalosis, or dehydration. These factors are loss of gastrointestinal secretions, caused by vomiting, diarrhea and fistula, and circulatory or renal insufficiency.

When several factors are operating simultaneously the resultant acidosis or alkalosis may be a very complex one, and it is only by careful and repeated chemical examination that it can be known what is actually taking place.

As the result of careful studies Dr. A. F. Hartmann of St. Louis has developed the Physiological Buffer Salts Solution whose effect is that of the combined administration of solutions administered heretofore; namely, physiological saline solution, Ringer's solution, and sodium bicarbonate solution.

The Hartmann Combined Solution has been used routinely in the St. Louis Children's Hospital in the treatment of acidosis, alkalosis, or dehydration for more than a year, and a chapter of Dr. William McKin Marriott's book,

Infant Nutrition, explains its use fully.
Dr. Hartmann's Solution, mentioned by Dr. Marriott, is supplied to the drug trade in sterile ampoules by Eli Lilly and Company.—Adv.

#### SCOPE OF SEDATIVE THE MEDICATION

W. Wolf, in the Memphis Medical Journal, May, 1930, writes of the importance of sedatives and hypnotics in the treatment of symptoms of ovarian and thyroid disturbance as observed during the menopause. Various classes of sedatives are discussed and placed in four groups, the bromides, synthetic organic compound, the barbituric acid derivatives and the true narcotic, opium group. In his cases of climacteric disturbances the bromides and opium derivatives do not find favor and some of the synthetic compounds not barbiturates, thus chloral, are ruled out as unnecessary. This group, however, yielded the most desirable of the sedatives, namely, Bromural, monobromisovalery-lurea, which the author preferred to the barbital derivatives, and to bro-

"We have found Bromural a happy bituric acid derivatives. It usually takes effect gently and without tangible sensation of oncoming hypnosis, an important point to overcome the frequent mental opposition to taking sedatives on the part of the patient."

The indications for sedatives are given as general nervousness, chronic and of indeterminable etiology, insomnia, spastic conditions, circulatory types of neurasthenia, emotional hypertension Adv.

and glandular conditions producing a lowered threshold of stimulation, such as parathyroid deficiency, hyperthyroidism, ovarian insufficiency, etc. Sedatives, and in particular Bromural, are suggested not only to directly relieve symptoms but also to keep the patient comfortable until other measures are applied and become effective. See page viii.—Adv.

## THE MODIFICATION OF POW-DERED MILKS GOVERNED BY THE SAME RULES AS COW'S MILK

When physicians are confronted with undependable fresh milk supplies in feeding infants, it is well to consider the use of reliable powdered whole milks such as the well-known Mead brand. Such milk is safe, of standard

composition and is easily reliquefied.
Under these conditions, Dextri-Maltose is the physician's carbohydrate of choice just as it is when fresh cow's milk is employed.

The best method to follow is first to restore the powdered milk in the proportion of one ounce of milk to seven ounces of water, and then to proceed building up the formula as usual. See page xi.—Adv.

#### DIET READJUST-DIABETIC

Some foods cannot be allowed in diabetic diet at all and others only sparingly. This means a readjustment in dietary habits that is difficult for the patient and trying for the physician. Practically all of the restricted foods may be duplicated by using Lister's Flour. Each of these starch and sugarfree foods looks and tastes like the food that it replaces in the diet. With the variety of foods, possible through the use of Lister's Flour, the patient is satisfied. There is no temptation to "cheat" and the case is better kept unisfied. der control. Some of the Lister foods are:

Bread, Biscuits, Cheese Biscuits, I Biscuits, Drop Cakes, Cookies, Cake, Charlotte Russe, Lady F
Bread Puddir Bread
Bread, Spice Crust, Pie Meringue, Salmon Fluff Ca French tising pa

# 50% faster—

# WAPPLER X-Ray Intensifying Screens

THINK of the wonderful improvement you could make in the diagnostic value of your radiographs by using intensifying screens having a 50% greater speed factor than any available heretofore!

Imagine the sharpness in radiographs of moving organs which this increased speed would make possible!

... and the wonderful contrast that could be obtained by using lower kilovoltage without any increase in your customary exposure time!

Consider the advantages of reducing those long exposure times you now have to use in radiographing heavy body parts!

... and the economy of longer useful life of X-Ray tubes!

Wappler Intensitying Screens are, conservatively, at least 50% faster over the entire range of kilovoltage ordinarily used in radiography. Yet in spite of their extraordinary speed, they are free from grain and lag. They are unusually durable, and are not adversely affected by X-Rays, heat or

humidity. They are pliable and their mirror-like surface is easily cleaned.

The coupon below will bring you interesting and valuable information regarding the surprising way in which these screens facilitate the making of superior radiographs. Mail it today!

## The PHYSICIAN'S POLICY is MEAD'S POLICY

Besides producing dependable Infant Diet Materials such as Dextri-Maltose, and maintaining a model laboratory devoted exclusively to research, Mead Johnson & Company for years have been rendering physicians distinguished service by rigidly adhering to their well-known policy, namely:

"Mead's Infant Diet Materials are advertised only to physicians. No feeding directions accompany trade packages. Information in regard to feeding is supplied to the mother by written instructions from her doctor who changes the feedings from time to time to meet the nutritional requirements of the growing infant. Literature is furnished only to physicians."

Every physician would do well to bear in mind that in this commercial age, here is one firm that instead of exploiting the medical profession, lends its powerful influence to promote the best interests of the medical profession it so ably serves.

MEDICAL SERVICE BULLETIN ON

## THIO-BISMOL

Bismuth, in suitable chemical form, ranks next to arsphenamines as an antisyphilitic agent. form of Thio-Bismol (sodium bismuth thioglycollate) it is taken up promptly and completely from the site of injection (the muscle tissues), reaching every part of the body within a short time with rapid therapeutic effect.

The injections cause a minimum of tissue damage, for Thio-Bismol is not only water-soluble but tissue-fluid-soluble, differing in this respect from other bismuth preparations. The intramuscular injection of Thio-Bismol causes,

as a rule, little or no pain.

Not the least important factor in Thio-Bismol therapy is the cooperation of the patient; the injections are so well borne and their effects so manifest that the patient is more than willing to continue the treatment for the necessary length of time.

Thio-Bismol, alone or in conjunction with arsphenamine, produces rapid therapeutic improvement, demonstrable by serologic tests and regression of lesions.

Accepted for N. N. R. by The Council on Pharmacy and Chemistry of the A. M. A.

Boxes of 12 and 100 ampoules (No. 156), each ampoule containing one average adult dose (0.2 Gm.—3 grs.) of Thio-Bismol, to be dissolved as needed, in sterile distilled water, a sufficient amount of which is supplied with each package.

## Mellin's Food

## A Milk Modifier

Mellin's Food is not simply a "sugar," for it contains mineral salts and protein in addition to the carbohydrates, maltose and dextrins. In consideration of the fact that Mellin's Food is not composed of sugar entirely—the actual carbohydrate content being 80% of the total composition—4 level tablespoonfuls of Mellin's Food to each 16 ounces of any dilution of milk will furnish an amount of added carbohydrates sufficient to maintain body heat and energy. This quantity of Mellin's Food is equivalent to the addition of from 1 to 2 ounces of sugar per day, the minimum and maximum amount of sugar usually advised by physicians for the full day's feeding of the normal infant.

Mellin's Food supplies the need for sugar but it accomplishes more than this by making the curd of milk soft and flocculent and by adding important salts for bone building.

Mellin's Food should therefore be considered as A General Milk Modifier applicable in the modification of milk in any form—certified, pasteurized, evaporated, dried or acidulated—always suitable in preparing nourishment for the bottle-fed baby and in successful use by physicians for a period of more than sixty years.

## DIET QUESTIONS have GELATINE ANSWERS

# BE EXACT WHEN PRESCRIBING "GELATINE"

A great many physicians are prescribing Knox Sparkling Gelatine for cases in which diet is an important factor as a preventive or corrective. Some physicians, however, merely prescribe "Gelatine."

There is such a great difference in gelatines that it is very necessary to designate the kind of gelatine

For example, our attention has just been called to a case for which a physician prescribed "gelttine in the diet of a diabetic When indications of acid developed it was learned that the patient had unwittingly been using a ready flavored jelly powder containing about 85% sugar, 2% acid flavoring, 12% gelatine and coloring matter

To guard against such errors, it is a wise precaution to stipulate Knox Gelatine and especially to call the patient sattention to the importance of the name 'Knox

This is an absolute assurance of the purest gelatine and an insurance against the presence of any foreign element likely to upset the essential balance of the diet

Always remember to add the name "Knox to every diet prescription in which gelatine is a factor

We would like to send every physician a publication on Diet in the Treatment of Diabetes by a widely known dieteticauthority This publication presents many new ideas and recipes in the preparation of beneficial diabetic diets. It is of such character that it may be placed in the hands of any patient with the assurance that it will act as a safe diet control, and at the same time make the patient more content with the prescribed diet. This publication will be sent in any quantity, to supply the diabetic patients of any physician who will mail this coupon.

Patient Types . . .

## The Rheumatic

Regular and adequate bowel elimination constitutes an essential part of treatment in the majority of patients suffering from the arthritic or gouty diathesis.

The comfortable action of Petrolagar is to be preferred to drastic physic. Petrolagar is pleasing to take and mechanically restores peristalsis without causing irritation and does not upset digestion.

Petrolagar, a palatable emulsion of 65% (by volume) pure mineral oil emulsified with agar-agar, has many advantages over plain mineral oil. It mixes easily with bowel content, supplying unabsorbable moisture with less tendency to leakage. It does not interfere with digestion.

Unless an antisyphilitic arsenical possesses these essential properties, it fails to comply with the requirements of Ehrlich. To assure reliable results, why not use Ehrlich's own preparation—Neosalvarsan?

In the abundance of convincing clinical experience, Neosalvarsan surpasses every other arsenical employed in the treatment of syphilis, for its use is world wide and not confined to any one country.

The laboratory finds are equally impressive. Among these the trypanosome test ("Tryp" test) is a most effective index of spirocheticidal activity. It has therefore been adopted as a routine procedure by the manufacturer of Neosalvarsan. Every lot is submitted to this test before it is allowed to leave the laboratory.

Furthermore, Neosalvarsan fully meets the requirements for chemical purity and ready solubility. Its margin of safety is at least 50% greater than demanded by the U.S. Public Health Service.

## More Effective Salicylate Medication

OR more than half a century the medical profession has depended on the Merrell Natural Product for maximum effectiveness with minimum of gastric disturbance.

And now, keeping in step with the newer thought in solicylate medication the Merrell Company have combined in one product—Alycin—Natural Sodium Salicylate with a balanced alkoli

Because Merrell's Natural Salicylates

are free from the usual gastric symptoms associated with the synthetic products, massive doses of Alycin can be given so as to obtain salicylic effect within the first 48 hours.

One teaspoonful of Alycin contains approximately 20 grains of Natural Sodium Salicylate with 40 grains of a balanced alkaline base.

Write for sample and literature describing this more effective method of salicylate medication.

#### PRE-OPERATIVE AND POST-OPERATIVE TREATMENT OF HYPER-THYROIDISM\*

By WILLIAM BARCLAY PARSONS, JR., M.D., NEW YORK, N. Y. From the Defortment of Surgery, Columbia University, Presbyterian Hospital, New York City

THE value of surgery in the treatment of hyperthyroidism is now well established. More than a skilfully performed operation, however, is needed to obtain satisfactory immediate and ultimate results. Unless the surgeon can combine in himself considerable medical as well as surgical experience, wisdom and skill, he must depend for great help before and after the operation on an experienced medical man, particularly in reference to diet, medication and cardiology. In addition, these two men need well-equipped metabolic, x-ray, electrocardiographic and pathological laboratory associates.

At the Presbyterian Hospital in New York City we have a special group working on the goitre problem. The director of the medical service is in genreal charge, and associated with him are a cardiologist, a chemist, Sangert who has reported his results in treating cases with radio-therapy, another surgeon and myself. All cases coming to the general clinic with disorders of the thyroid gland are referred to this clinic for diagnosis, consultation and treatment. The group directs the treatment of the patients whether as out-patients or in the hospital, and, after discharge from the hospital, from a follow-up standpoint.

Diagnosis: Under the heading hyperthyroidism are included cases of typical Graves disease and of adenoma with hyperthyroidism. We² are heartily in accord with most American writers that these two conditions represent different forms of the same disease, namely, that typical exophthalmic goitre usually represents a primary severe thyrotoxicosis, while so-called adenoma with hyperthyroidism represents a milder toxicosis in older individuals who have had a previously enlarged thyroid.

A good history is often of prime importance

\*Read before the Semi Annual Meeting of the New Haven County
Medical Society at Waterbury, Connecticut, October 24, 1929.

and always of great interest. It is a frequent occurrence to have the patients date the onset of symptoms from an illness, such as influenza or tonsillitis, a fright or a severe strain, but close questioning will often reveal characteristics in the individual antedating the supposed onset of symptoms that indicate slight over-activity of the thyroid for many preceding years. Suggestive in this respect would be fatigueability, attacks of "nerves," particularly those associated with loss of weight and gastric or intestinal upsets, irritability and heart attacks without any history of rheumatic fever. The general psychological makeup is similarly important, particularly in differentiating hyperthyroidism from neuro-circulatory asthenia or the psychonemoses, where nervousness, tachycardia, insomnia, loss of weight and strength or other suggestive complaints can be ascribed to an occupational or familial condition, and hyperthyroidism as such does not obtain. We do not feel that frights, worries, illnesses, etc., cause hyperthyroidism, but do feel that following the stimulation of one of these strains an abnormal thyroid may continue in an overactive state, and that what was physiological activity in response to a demand for the liberation of energy may thus become a definite pathological condition. In close connection with this it is important to ascertain whether the present illness represents the first evidence of hyperthyroidism, and whether a simple enlargement had been present before the onset of acute symptoms.

In the physical examination particular attention should be given to the shape and size of the heart by percussion and by x-ray, and to its efficiency. Notation of the pulse rate before and after exercise and rest, the blood pressure and in particular the pulse pressure must be observed, as tachycardia at rest and a high pulse pressure are usual findings in hyperthy-

oidism. Precordial systolic murmurs that are ot transmitted are nearly always present and ave little if any significance. Actual valvular lisease, however, particularly with a history of theumatism, when present is important in both treatment and prognosis. Whether the land is nodular or symmetrical should check with the history, the nodular usually occurring in the cases with pre-existing goitre, the symmetrical usually being found in the primary Rotation of the gland around the trachea not infrequently takes place, with one of two symmetrically enlarged lobes lying well back in the neck, so that apparently there is a unilateral globular enlargement present. By lateral pressure against the trachea one can dislocate the hidden lobe so that it may be palpated or even seen, and thus be reasonably sure of a bilateral enlargement. In the x-ray of the chest it is more important to look for narrowing or deviation of the trachea than for a shadow suggesting an intrathoracic exten-So frequently the radiability of the sion. goitre differs so slightly from that of the thoracic wall that no appreciable shadow is cast, but a deviated trachea can nearly always be detected. Examination of the vocal cords before operation is most important and should not be omitted from the routine physical examination. In reference to the eyes we consider exophthalmos more important from a cosmetic than from a diagnostic standpoint. Even a slight stare is significant, but a lack of this or of exophthalmos is of no value. Lagging of the lids and the other points stressed some years ago seem to depend on the degree of exophthalmos and hence are of little impor-

The basal metabolic rate should be done when the patient is ambulatory and again after a few days in bed before iodine has been started. This test is frequently the determining factor in a doubtful case, and in such cases one reading is not sufficient, but two or three should be made within a week, the patient being under observation in bed meanwhile.

In the electrocardiogram one should look for delayed conduction time, irregularity in rhythm, disturbances in the origination of impulses and the direction of the T waves. Postoperative changes in the electrocardiographic findings are often most striking and most satisfactory from a prognostic standpoint.

Treatment: We still feel that hyperthyroidism in children can be treated conservatively. One child of five did excellently with small doses of x-ray and has remained well for over five years. A few girls of twelve to fourteen have done well under rest in the country away from school and the noise and excitement of the city. But in those nearing twenty and in the

adults we feel that although radiotherapy eventually cures many, it has the disadvantages of delay, a chance of failure after many months of trial, and if failure does occur that surgery is then more difficult, in that the gland is harder to deliver and that there is more In the last few years the operative mortality in all the larger thyroid clinics has been brought below 1 per cent, a figure that compares most favorably with other surgical procedures and with the mortality of 14 per cent quoted by Hyman and Kessela in their series of cases treated medically. Although the reports from a close personal follow-up of thyroidectomy for hyperthyroidism are all too few, it is fair to say that surgery is the treatment of choice. In a report last year<sup>2</sup> we found that only 5.5 per cent of our cases never returned to full work, and that 67.3 per cent were symptom-free with normal basal metabolic rates at follow-up visits from 6 months to 7 years postoperative. Of those with anything less than a perfectly satisfactory condition at follow-up 37 per cent complained of cardiac symptoms due to prolonged hyperthyroidism.

We do not differentiate in treatment between exophthalmic goitre and the so-called adenoma with hyperthyroidism, as they both suffer from qualitatively identical hyperthyroidism, although individuals will differ in age, severity of symptoms and degree of cardiac involvement. There are three important objectives in all cases, namely rest, nutrition and iodine. certain cases the cardiac element is also to be taken care of, and occasionally one sees a true diabetic. When this occurs it of course modifies the dietary régime, and is of importance in that respect; but granting control with insulin, so that a relatively high caloric diet can be given, diabetes per se is of no particular moment and is usually favorably influenced by operation.

Rest: Complete, continuous rest in bed is not advised except for the cases with congestive heart-failure. We have found that the patients are happier, eat and sleep better, and maintain better muscular condition if they are allowed up for say two hours a day and can get on the roof or the solaria. A mild sedative such as luminol or bromides is given to all patients. Occasionally codeine, morphine or paraldehyde is necessary, but the more powerful sedatives are rarely used ante-operatively, iodine being used in the cases in crisis.

For the cases with cardiac decompensation we institute a typical régime for that condition, irrespective of their hyperthyroidism, granting that a crisis does not intervene. For example, a woman with long standing heart disease was admitted to the hospital about two years ago in acute decompensation with auric-

ular fibrillation. She was put to bed and given digitalis but soon began to vomit and became much worse. Iodine controlled the vomiting and in a reasonable time she stood her operation satisfactorily. She has, however, continued to fibrillate and has a heart of low efficiency, although otherwise satisfactory from the standpoint of hyperthyroidism.

In less severe cardiac cases we have found it wise if possible to improve them by rest until they are able to be up in a chair part of the day before starting iodine therapy. An ability to tolerate this amount of activity can be taken as an indication of considerable restoration of heart efficiency. Psychic as well as physical rest should be striven for; sedatives quiet people, but much can be done to cheer and encourage them. It is most helpful for the preoperative to see the post-operatives, after these have passed through the two or three uncomfortable days immediately following operation, as it gives them a definitely increased confidence in their own outcome. Similarly an attempt is made to hold up the day of operation as something not to be dreaded but to be desired as leading definitely to health. We have given up surprising the patients on the morning of operation, but tell them at least a day ahead, and have found that by the day of operation they have largely overcome the immediate excitement and come to the operating room in a far better frame of mind.

Nutrition: Loss of weight and fatigueability represent the results of increased metabolism not offset by an adequate increase in intake, and a consequent loss in muscle substance and Palmer et al' have indicated, by their studies of the creatin and creatinin output of these patients on a diet lacking in animal protein, that there is an actual breaking down of the patients' own muscle protein, which disappears as they improve under iodine. Palmer also insists that any patient can be made to gain weight if sufficient calories are taken. It is, however, necessary to give them more cal-ories than their increased basal metabolic rate would seem to demand; at least another 100 per cent over the figure that would represent their basal requirements plus the percentage indicated by the basal rate determination, i.e., if the basal requirement is 1500 cal. and the basal metabolic rate is 50%, a total of at least 3750 cal. per day will be required for weight to be gained.

We believe strongly that the diet should be well balanced, and that a marked increase in carbohydrate and fat should be accompanied by an adequate increase in protein. The specific dynamic action of protein enters into this, as well as the need for protecting the patients' own muscle protein, and we do not admit the

desirability of cutting down the protein intake out of proportion to the carbohydrates and fat.

In the preparation of patients with hyperthyroidism for operation, the value of iodine is as well established as that of quinine in malaria. But it differs from the latter in that a tolerance is often quickly established. This is a danger stressed by all surgeons, but apparently it requires repeated mention. Now and again a patient will do well on iodine and remain well for a considerable period, but the time will almost certainly come when that patient is in a serious condition and will no longer react to iodine. Every so often one comes to the hospital in this situation, and the surgeon then has to operate on a dangerously ill patient without the great safeguard that was formerly at hand but has been heedlessly wasted.

Our usual procedure is a varying period of rest with a high caloric diet before iodine is started. Depending then on the patients' general condition, we give them one to two weeks of iodine preparation. We usually give 1 cc. of Lugol's solution per day in divided doses for a week, then 2 cc. a day for a similar period. The larger amounts are used in the more toxic cases, as we feel that although small doses may suffice for many cases a good saturation in the more severe ones is of value in decreasing mortality. This of necessity must be merely an impression, as it is not subject to scientific proof.

Some patients object to the taste of Lugol's solution even when disguised in an elixir, grape juice of other vehicles. Sodium iodide in one-tenth of the Lugol's solution dose seems to work almost as well. Sodium iodide also is less irritating by rectum, and can be given in intravenous infusions or subcutaneously by hypodermoclysis.

Digitalis: This is of no value in the simple tachycardia of hyperthyroidism, but we use it in congestive heart failure as it would be used in ordinary heart disease not associated with hyperthyroidism, and in cases of auricular fibrillation to slow the ventricular rate. Occasionally it will re-establish regularity of rhythm, but this is the exception. Usually sinus rhythm does not appear in a previously irregular heart until after operation, but fortunately this can be expected in a high percentage of cases, and has been observed as early as the second post-operative day.

Time for Operation: We do not depend upon improvement in the basal metabolic rate alone or the attainment of any particular level before operation. Unfortunately this test does not indicate with sufficient accuracy the exact operability. We demand an improvement in the metabolic rate, but consider of equal im

portance an improvement in the average pulse rate, the body weight, and the general clinical appearance of the individual. If there is an improvement in all four of these points we are atisfied. If any one of them fails to show improvement we prolong the pre-operative period up to about three weeks. A longer preparation than that is not usually followed by satisfactory results, and it is then considered best to proceed with an operation in stages rather than to hope for sufficient improvement for the complete operation at one sitting.

Post-Operative: After operation the objects of treatment are rest, fluids, iodine and nutrition.

Rest: In this period sedatives are most important and morphine should be used freely. An idiosyncrasy towards morphine should be watched for as it is not infrequent in hyperthyroidism. Paraldehyde is then most useful. Hyascine occasionally works well, but it is a dangerous drug and so frequently has a secondary stimulating effect that it should be used with great caution. In the extremely toxic cases it is wise to keep them well under sedative control for at least 48 hours. mides per rectum, aided by the controlling effect of iodine, are often sufficient to control the post-operative nervousness, and in any case supplement the action of the stronger hypnotics.

Fluids: A copious fluid intake is important enough before operation, but is even more so afterward. A daily intake, or perhaps better an input, of three to three and a half litres should be insured for the first 48 hours by the use of tap water per rectum and glucose by either intravenous infusion or subcutaneous hypodermoclysis. All our cases receive immediately after operation 1500 cc. of 5% glucose containing 0.3 to 0.5 gm. of sodium iodide in the vein or under the skin. On occasions a slow continuous infusion is used at the rate of one litre in six hours. When this is done it is important that alternate flasks should be of normal salt solution without glucose, in order that the sodium chloride balance should not be disturbed. By giving the iodide directly into the circulation one is assured of its delivery and absorption, which does not obtain when one depends on retention and absorption of fluid introduced into the rectum.

Diet and Iodine: As soon as swallowing becomes reasonably easy fluids of all sorts are begun and soft diet is rapidly added. A high caloric intake is again striven for, but this is not as essential as in the pre-operative period.

Iodine can now be taken by mouth, and the large doses required immediately post-operative are no longer required. Either Lugol's solution or sodium iodide can be used and the

daily dosage rapidly reduced to 1 cc. or 0.1 gm. respectively. This dosage is maintained until discharge from the hospital and is kept up for about one month following discharge. If the taste of Lugol's solution or sodium iodide is objected to, one can use the syrup of hydriodic acid in equivalent doses.

The typical post-operative Complications: crises of severe degree are far less common than they were before the use of iodine, but do occur in the severe cases. They always require prompt and unremitting attention, and should if possible be anticipated by the use of plenty of sedatives, iodine and fluids. Ice bags to the head, chest and extremities and frequent cool spongings are soothing and tend to control the temperature. Colonic irrigations supply fluid and may be used for cooling purposes by using cool water. In the cases that develop coma and suggest acute deprivation of thyroid substance good results have been reported from the use of thyroxin intravenously, but our experience with it has been too limited to be conclusive.

Occasionally auricular fibrillation will occur as an immediate post-operative complication, and this is the only indication in our opinion for the use of digitalis, as it has no effect on the tachycardia of a regular heart.

Post-operative hemorrhage must be handled as the indications demand. If this is large it is presumably from a bleeding artery requiring ligature, if merely from oozing points it can usually be controlled by packing.

Nearly all cases will show some tracheal irritation for a few days. Inhalations of steam and codeine by mouth will usually control these promptly. If the patient is made to speak immediately after recovery from the anaesthetic and has a good voice, one need not be concerned over a hoarseness appearing a few hours later.

Post-operative tetany may develop even though none of the parathyroid bodies was removed, presumably due to impairment of their blood supply. A tingling sensation in the hands and feet or a tightness and stiffness of the lips often appears before the typical carpopedal spasm and positive Chvostek sign. This warning should at once be heeded and a blood calcium determination made. Before this laboratory report is obtained the patient should receive ten or fifteen units of Parathormone, and calcium lactate should be started. If actual convulsions occur the Parathormone should be repeated as often as is necessary, and the calcium lactate should be continued until the blood-calcium has regained its normal level, but should not be continued beyond this point. If the patient is unable to take calcium by mouth it may be given intravenously preferably as calcium acetate, or even as calcium chloride.

Advice: Before the patients leave the hospital a real attempt should be made to make them understand the nature of their disease and the physiological principles involved in their future Too early return to full activity is extremely bad, and yet it is most important that they should receive the psychological stimulus from an as early as possible return to at least partial activity. The cases with cardiac damage must accept a more prolonged or permanent restriction of activity, but a vast majority of the remainder may look forward to real health. Daily rest in the middle of the day is no more important than a gradual increase in physical activity, preferably as outdoor exercise. Perhaps the best example of this procedure was given by an ex-pugilist who had a very severe thyrotoxicosis. He went into regular training and after he could handle roadwork took up shadow-boxing, and by three months after operation was back at full work and has continued so for the past five

We do not believe in restriction of diet as a general rule but urge a large water intake between meals. Sedatives are hardly ever required but, as stated above, the patients take 1.0-2.0 cc. of the syrup of hydriodic acid for a month. We warn strongly against pregnancy for at least a year, as in two of our cases this definitely precipitated a return of symptoms to a marked degree.

Last, but by no means least, we strongly urge a faithful return to the follow-up clinic. We try to get return visits at one, three, six, twelve and eighteen months, and at yearly intervals after two years, unless some indication appears for more frequent visits. We feel that many of the patients are benefited and know that it has been of inestimable value to all of us. Reports of the results of surgical treatment based on close personal follow-up over long periods of time are conspicuous by their rarity. Too many writers claim better than ninety per cent cures based on the letter method of follow-up. This method is unfortunately absolutely unreliable and can give no accurate information as to the status of the individuals or the group as a whole. Reports based on personal follow-up, even in small series, are really needed to evaluate the results of treatment in the various classes of this rather frequent and extremely important dis-

#### HOW SHALL WE LOWER MATERNAL MORTALITY?

By John H. Barry, M.S., M.D., NEW YORK, N. Y.

This article deals with the Borough of Queens, which contains about one million inhabitants. It is written for the Department of Health of Greater New York by the Assistant Sanitary Superintendent of the Department in charge of Queens Borough.—EDITOR'S NOTE.

ARECENT survey of ours of the comparative Borough maternal mortalities showed a readjustment and improved standing of Queens in the corrected statistics. It defined its position as a close third, instead of a distanced last as published in the Metropolitan press.

We have now undertaken a classification of the Borough deaths of 1929 in the hope that some emphasis might be placed upon the more common causes, and a study made towards betterment, and improved life-saving in these indicated regards. Our study shows 89 Queens maternal deaths in corrected figures distributed between hospitals and homes as follows:

Hospitals ..... 86+ per cent—77 cases Homes ...... 13+ per cent—12 cases

This cannot be taken as a challenge of lessened skill or caution in hospital service, as it will be readily claimed that institutions are sometimes used as a last haven for the treacherous and temporarily-thwarted deliveries.

It has not been possible to calculate the perntage of cases sent in as emergencies to hossitals where midwife or home service seemed nadequate, but we may be able under later-inculled methods to make some early future estinates.

We have inaugurated a system within the past few months, at the instance of our Health Commissioner, whereby all puerperal fatalities are marked for checkup by inspectors' investigations, to determine whether or not the case was in the preliminary care of a midwife. Of the six reported septic deaths thus far this year, none had been under such preliminary care.

The maternal death records of the general hospitals of the Borough show varying degrees of per cent of mortality ranging between 3.84 per 1,000 and 9.40 per 1,000. (See table—also prenatal activity in same.)

Of the births of 1929 occurring in Queens, there were delivered:

At home ..... 7,794—60 per cent of cases At hospitals ... 5,248—40 per cent of cases (Including private hospitals)

These figures will not do justice, doubtless, to hospital service, as the difference between uncorrected and corrected figures (some 5,000 births) are almost entirely hospital deliveries in these out-of-Borough cases. This would convert the percentages to 75+ per cent hospital cases—24+ per cent home cases. (Uncorrected Queens figures are actual births occurring in the Borough. Corrected Queens figures are children born of Queens residents without reference to the Borough in which delivered.)

Hospital records differ in the amount of prenatal clinic service given, where they range from 21½ to 64 per cent. The six general hospitals of the Borough have cared for 3,723 births throughout 1929.

A computation has also been made of the intra and extra Borough mortality.

- 54 deaths in 13,000 born in Queens (in round figures) show a rate of 4 per thousand.
- 35 deaths in the 5,000 cases of Queens mothers delivered in other Borough of the greater City show a rate of 7 per thousand.

Of the primary causes of deaths in Queens Borough mothers for 1929 we find the most notable and common to be:

Sepsis	20
Ectopic (8 ruptured)	11
Caesarean (1 with sepsis)	10
Eclampsia (including nephritis)	
Embolism	

A full list of causes (primary and secondary) is to be found at end of article.

### Pre-Natal Care

A study has been made of the records of hospitals and of our two Department Pre-Natal Clinics with regard to the services they rendered, and the appended chart shows percentages ranging from 64 per cent to 21½ per cent.

In the instance of our Department Clinics:

No. 1 had 363 mothers on registry with 1,069 visits made during 1929.

No. 2 had 182 mothers on registry with 984 visits made during 1929.

There were 1,800 patients given pre-natal care at six hospitals, and our two Department Clinics, a percentage of only 13 plus of delivered cases of the Borough. This, of course, does not reckon with the pre-natal care rendered by private physicians, which may always remain a matter of speculation and not official record.

Of the secondary causes and complications, we find heart, embolism, and kidney defunction or antecedent disease are commonly called upon in our maternal death certificates. The inference seems clear that if we can control hypertension by diet, rest and hygiene, and if we can better avoid infection of our expectant mothers, three great sources of maternal fatalities will have been approached, and perhaps better impressed.

## Sepsis

What has become of the boast of Jewett expressed many years ago:

"Such is my faith today in Antiseptic Midwifery, that I do not hesitate to promise my patient that she *shall* not die of Sepsis."

And yet 22½ per cent of our fatalities are primarily referable to septic infection, and the latter, not always developing in the hands of the poorer-trained, careless or slovenly midwife or obstetrician.

Many factors must be considered in order to properly safeguard our patient. Sometimes we doctors ourselves are at fault. Hurry, thought-lessness, lack of faith in what scrupulous and unfaltering devotion to asepsis and cleanliness will bring, recent engagement with pus or infectious cases may initiate a fatal maternal infection.

On the other hand, our most conscientious, painstaking and ordinarily safe methods may be made valueless, for want of equally careful and thoughtful follow-up nursing.

Hospitals should insist on the isolation and exclusive nursing of all post-partum cases as soon as any suspicion of sepsis seems well-founded or positive smears obtained. The patient may thus obtain more thoughtful care and the cases in

adjacent beds may be the better safeguarded against transmission by the same nurse caring for the infected case.

Dearth of help must not be a legitimate or worthy excuse to fail in affording exclusive nursing care of an infected case.

#### Ectopics

One is forced to marvel at the extreme frequency of deaths from ruptured ectopic gestation. We had been disposed to believe that the condition was of very definite rarity, but when it reckons with 11 fatal ectopic cases out of 89 deaths—about 12.3 per cent of maternal deaths from all causes—it must take a very substantial place in the records, and it would seriously suggest the thought that more intensive effort must be made at accurate diagnosis to apprehend, if possible, such fatal ruptures, or to be prepared, by definite knowledge, for the immediate need and control of shock and hemorrhage by early abdominal interference.

Every patient with atypical signs of pregnancy should always be borne in mind as a potential ectopic, and we should be prepared for what has become the surprises and staggering shocks to us who have frequently had no thought of an existing ectopic, until the most treacherous and dangerous signs show. There is still a lack of accord as to the wisdom of immediate or delayed interference, but certainly a knowledge, wherever possible, of what we have to deal with, is a splendid starting-point for helpful service.

#### Caesarean

Later thought has not changed the opinion expressed in 1921 in an essay by us on "Conservative vs. Radical Obstetrics," that the Caesarean operation is being overdone, and that its mandatory necessities are being based on questionable judgment.

A recent writer on the subject, whilst pleading for conservative obstetrics, lists 17 cases in 1,000 group cases and states that his only deaths in that group were 3 Caesareans. We should like to reaffirm our statement of an experience reckoning with 1,500 cases, in most of which we were in personal control, in some of which we were in hospital supervisory control, as obstetrician, wherein but one undeliverable situation confronted us, and this a craniotomy on a child known to be dead at the time.

Caesarean used to be considered "La dernière resorte," to be taken up not entirely after all other methods had failed (which would not be scientific) but only after history, repeated pelvimetry, and sometimes, at least, some attempts at spontaneous delivery had failed.

History is somewhat unreliable, as we know, from the absence of dystocia in later labors after

severe preliminary ones. The foetal head is always a somewhat variable quantity even if the pelvic strait would not be.

The Caesarean delivery is of course theatric and exceedingly satisfactory when successful, but it must leave many grounds for remorse in be-reaved families when it fails, lest too heroic a measure has been undertaken upon poor judgment or groundless fears. The records show 10 Caesarean deaths in Queens mothers in a year. We have not on hand the record of how many might have been successful. We know that there must have been a goodly number which succeeded. We regret an inability to say how often Caesarean has been determined upon in a given number of cases, but we doubt not that it is a rather frequent operation in the hospitals of the greater City in the present day.

Ordinarily, it should be considered the acme of obstetrical and surgical skill and experience, and its success should not be handicapped by being undertaken by those lacking the widest experience in surgical technique or the broadest possible first-hand experience in preliminary training and assistance at such operations. We cannot help but reiterate the belief that some maternal lives would be spared by less of Caesarean and more of version or forceps.

#### Eclampsia

With the growing knowledge of dietetic influence upon heart and kidney conditions and toxaemias resulting from their decompensation or defunction, it would be well hoped that we might score a better record than 14 cclampsia It has not been possible to calculate the percentage of cases sent in as emergencies to hospitals where midwife or home service seemed inadequate, but we may be able under later-installed methods to make some early future estimates.

We have inaugurated a system within the past few months, at the instance of our Health Commissioner, whereby all puerperal fatalities are marked for checkup by inspectors' investigations, to determine whether or not the case was in the preliminary care of a midwife. Of the six reported septic deaths thus far this year, none had been under such preliminary care.

The maternal death records of the general hospitals of the Borough show varying degrees of per cent of mortality ranging between 3.84 per 1,000 and 9.40 per 1,000. (See table—also prenatal activity in same.)

Of the births of 1929 occurring in Queens, there were delivered:

At home ..... 7,794—60 per cent of cases At hospitals ... 5,248—40 per cent of cases (Including private hospitals)

These figures will not do justice, doubtless, to hospital service, as the difference between uncorrected and corrected figures (some 5,000 births) are almost entirely hospital deliveries in these out-of-Borough cases. This would convert the percentages to 75+ per cent hospital cases—24+ per cent home cases. (Uncorrected Queens figures are actual births occurring in the Borough. Corrected Queens figures are children born of Queens residents without reference to the Borough in which delivered.)

Hospital records differ in the amount of prenatal clinic service given, where they range from 21½ to 64 per cent. The six general hospitals of the Borough have cared for 3,723 births throughout 1929.

A computation has also been made of the intra and extra Borough mortality.

- 54 deaths in 13,000 born in Queens (in round figures) show a rate of 4 per thousand.
- 35 deaths in the 5,000 cases of Queens mothers delivered in other Borough of the greater City show a rate of 7 per thousand.

Of the primary causes of deaths in Queens Borough mothers for 1929 we find the most notable and common to be:

Sepsis	20
Ectopic (8 ruptured)	11
Caesarean (1 with sepsis)	
Eclampsia (including nephritis)	
Embolism	

A full list of causes (primary and secondary) is to be found at end of article.

### Pre-Natal Care

A study has been made of the records of hospitals and of our two Department Pre-Natal Clinics with regard to the services they rendered, and the appended chart shows percentages ranging from 64 per cent to 21½ per cent.

In the instance of our Department Clinics:

No. 1 had 363 mothers on registry with 1,069 visits made during 1929.

No. 2 had 182 mothers on registry with 984 visits made during 1929.

There were 1,800 patients given pre-natal care at six hospitals, and our two Department Clinics, a percentage of only 13 plus of delivered cases of the Borough. This, of course, does not reckon with the pre-natal care rendered by private physicians, which may always remain a matter of speculation and not official record.

Of the secondary causes and complications, we find heart, embolism, and kidney defunction or antecedent disease are commonly called upon in our maternal death certificates. The inference seems clear that if we can control hypertension by diet, rest and hygiene, and if we can better avoid infection of our expectant mothers, three great sources of maternal fatalities will have been approached, and perhaps better impressed.

### Sepsis

What has become of the boast of Jewett expressed many years ago:

"Such is my faith today in Antiseptic Midwifery, that I do not hesitate to promise my patient that she *shall* not die of Sepsis."

And yet 22½ per cent of our fatalities are primarily referable to septic infection, and the latter, not always developing in the hands of the poorer-trained, careless or slovenly midwife or obstetrician.

Many factors must be considered in order to properly safeguard our patient. Sometimes we doctors ourselves are at fault. Hurry, thought-lessness, lack of faith in what scrupulous and unfaltering devotion to asepsis and cleanliness will bring, recent engagement with pus or infectious cases may initiate a fatal maternal infection.

On the other hand, our most conscientious, painstaking and ordinarily safe methods may be made valueless, for want of equally careful and thoughtful follow-up nursing.

Hospitals should insist on the isolation and exclusive nursing of all post-partum cases as soon as any suspicion of sepsis seems well-founded or positive smears obtained. The patient may thus obtain more thoughtful care and the cases in

#### DIABETES INSIPIDUS, A CASE REPORT

By FREDERICK WILLIAMS, M.D., NEW YORK, N. Y.

IABETES INSIPIDUS although a comparatively infrequent disease has attracted much interest and has given rise to a vast amount of literature. Toward the end of the seventeenth century Willis' differentiated Diabetes Insipidus from Diabetes Mellitus by the absence of sweetness of the urine. This was verified fifty years later by Cullen.2 The condition was first produced experimentally by Claude Bernard who punctured the floor of the fourth ventricle in animals. The condition has been associated with injuries and tumors involving the pituitary body. Recently it has been shown that this set of symptoms may be produced in animals and does occur in humans when there is injury, inflammation or new growth in the region of the tuber cinerium or mammillary bodies.3 Leschket however, reported sixteen cases of complete destruction of the hypophysis with no poly-Bourquin<sup>5</sup> in 1927 reports experimental work on dogs in which the syndrome was produced by cauterizing only the floor of the third ventricle and did not follow hypophysectomy without injury to the floor of the third ventricle at the proper site. The entire problem of pathological basis for the syndrome is excellently summarized in the recent article of Finks in reporting the autopsy findings in 107 cases from the literature. He found sixty-three percent tumors of the base or posterior fossa, thirteen per cent syphilitic process of basal meninges or gumma, twenty-four per cent trauma. In his conclusions he states that most of these are not of localizing

The case reported presents the following interesting phenomena:

- 1. A tremendous total twenty-four-hour urine output especially in response to urea.
- A very rapid clinical course ending fatally in one year since the time of the initial luctic lesion, which was presumably the etiological factor of the diabetes insipidus.
- 3. An intolerance to sugar as shown by the glucose tolerance curve.
- 4. Failure of subcutaneous injections of commercial pituitrin to control the polyuria.

#### CASE REPORT

History: Male, age 33 years, born in Italy; in America thirteen years; occupation, laborer. Entered the hospital in September, 1928, with chief complaints of dizziness, inability to stand, poor vision, numbness in fingers and toes, polyuria, polydypsia, loss of weight, bulemia.

Family History: Negative.

Personal History: Alcohol occasionally; tobacco moderately; no drugs. Previous Medical: Suffered occasionally with colds, otherwise negative.

Veneral: Chancre in October, 1927. Treated with nineteen Bismuth treatments, eight arsphenamine treatments, one silver salvarsan. On January 10, 1928, his Wassermann was four plus (blood). During February and March he was receiving treatment. April 23, 1928, his spinal fluid Wassermann and colloidal gold curve were reported negative. No report of following treatments.

Surgical: In 1910 he had a herniotomy done in Italy.

Present Illness: During October, 1927, he began to have pains in the back of the head, neck and trunk. These were mild at first and he paid no attention to them. They progressed and in January he went to the clinic and had the treatments outlined above. The pains were relieved. Toward the end of March, 1928, he began to have dizzy spells. In April he was taken into the hospital for one day and a spinal tap done with the report of the findings as above. Early in August he began to have difficulty in walking and standing erect. He also noticed at this time numbness in his hands and feet. Polyuria and These bepolydypsia began at about this time. came progressively worse. Bulemia became a symptom and in spite of this there was an extreme loss of weight. He had lost fifty pounds in three months. At the end of August he noticed diminution and blurring of vision. With the rapid progress of all these symptoms in September he was brought into Bellevue Hospital.

Physical Examination: Adult, white male; lethargic, weak, appears acutely ill. Head: scalo was normal but dry. Ears and nose were normal to external examination. Eyes: lids were normal, conjunctivæ injected, pupils were small, irregular, sluggish reaction to light and accommodation. Mouth: lips dry and red. poor. Tongue: dry, red, beefy. Throat: dry, red, no exudate or membrane. Neck: no dilated veins, no nodes, no thyroid enlargement or rigidity. Chest: lungs were normal. Heart: no signs of enlargement, no murmurs or irregularities. Abdomen: moderate distention, no rigidity, no viscera palpable, no masses. Extremities: suggestive clubbing of the fingers, no edema of the ankles. Vessels: no tortuosity or sclerosis. Reflexes: left (KJ) diminished; right (KJ) normal; no babinski sign, no tabetic gait, Rhomberg positive, no sensory changes. Skin: loose and very dry. Lymphatics: epitrochlear glands not palpable. Ophthalmological note: Complete annular detachment in each eye; this transilluminates fairly well; no light perception in either eye; much intra- and subretinal exudate with

N. Y. State J. M. September 1, 1930

small retinal hemorrhages. This process does not suggest an intracranial origin but rather a local inflammatory involvement possibly due to a general condition, probably lues.—W. L. Hughes.

X-ray Report of the Skull: The cella turcica is normal; the clinoids are well formed.

Encephalogram: The encephalogram reveals more or less symmetrical dilatation of both lateral ventricles, considerable dilatation of the third ventricle and a larger accumulation of air in the sulci than is normally seen. There is no ventricular shift. The encephalographic findings indicate degenerative disease of the brain probably on a vasculo-luetic basis with secondary hydrocephalus exvaccuo. We are probably not dealing with a neoplasm. The encephalographic findings together with the report of the ophthalmologist would seem to indicate meningovascular lues as the basic disease.—E. D. Friedman.

Laboratory Findings:

Blood pressure: 130 systolic, 90 diastolic on admission.

Blood Wassermann: one plus, September 10, 1928.

Blood chemistry: Non protein nitrogen, 33, sugar 90.

Spinal fluid Wassermann: two plus, September 5, 1928.

Spinal fluid colloidal gold curve 5555433100. Spinal fluid colloidal gold check 5554421100. Phenosulphothalein test: 20% first hour, 35%

second hour.

Urinary Findings: Volume (See Chart No. 1):
During the first fifteen days in the hospital on fluids ad lib., the volume output in twenty-four hours steadily rose from about five liters per day to fifteen liters per day. On the occasion of an attempt at a urea concentration test the response was a tremendous volume output of 34.8 liters

in the twenty-four hours. The following day the volume dropped to 17 liters. Pituitrin was then begun. This was a commercial product given subcutaneously in 0.5 cc doses at twelvehour intervals. This was continued for three days with volumes of 16, 17.5 and 13 liters respectively. As these showed no marked reduction, the following morning a single injection of 1 cc was given. The volume for the succeeding twenty-four hours was 21.5 liters. Thereafter the dosage was increased to 1 cc twice a day at twelve-hour intervals. The only accurate volume output which we were able to obtain after this was 14 and 19 liters. Following this the patient became incontinent and observations were unreliable. The pituitrin was withheld when diarrhœa began. Specify gravity: at no time in any of the urine analyses did the specific gravity ever exceed 1003. Sugar: the analysis of the first twenty-four-hour urine output showed an

incomplete volume with sugar present to the extent of 0.2% or 7.6 G in the specimen collected. The next day a still incomplete specimen showed

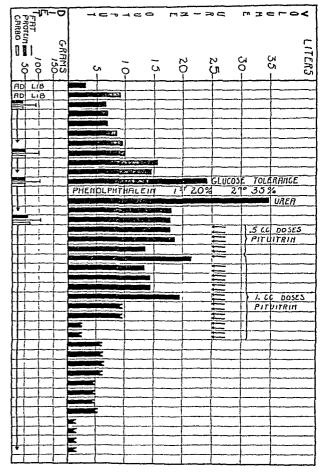

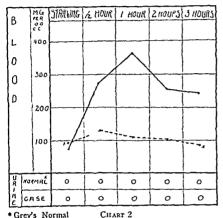

CHART 1

a total sugar of 10 grams. On the following day the diet was restricted to protein—55 grams, carbohydrate—35 grams, and fat—70 grams. Following this the urine was sugar free and remained so until the end. From time to time the diet was raised as shown by the chart but at no time was sugar ever found in the urine. At no time during the sugar tolerance tests was there ever any sugar found in the urine. Sugar tolerance test: (See Chart No. 2.)

	Blood	Urine
Starving	85 mg	Negative
100 grams glucose	given by	mouth:
1/2 hour later	235 mg	Negative
1 hour later	330 mg	Negative
2 hours later	230 mg	Negative
3 hours later	220 mg	Negative

Progress: The course of the condition while the patient was under observation was one of rapidly progressive degenerative disease of the brain The dimness of vision progressed to absolute blindness Incoherence progressed to complete disorientation and delirium was occasional Incontinence of sphincters developed and soon after, death ensued from exhaustion Shortly before death some rigidity of the neck was noticed but a lumbar puncture revealed no new findings Death occurred forty days after admission and permission for necropsy was refused

Although not proven by necropsy, the etiology was assumed to be a vascular lueto lesion of the brain which had involved the region of the tuber curerium and mamillary bodies. The facts from the history of a primary luetic lesion about one

year previous and the verification of the treat-

ment received during the year with the development and rapid progress to a fatal termination seemed worthy of mention

#### SUGAR TOLERANCE

In consideration of sugar tolerance tests it is important to first consider what response to expect from the normal In 1922, John' classified individuals in regard to the response to the glucose tolerance test (using 100 grams of glucose)

- 1 Non-diabetic, those in whom the blood sugar returns to normal within three hours These he subdivides into \*
  - A Strong normal
  - B Normal
  - C Weak normal or pre diabetic
- 2 Diabetic, those in whom the blood sugar returns to normal only after 6 to 9 hours

Grays in 1923 performed glucose tolerance tests on three hundred normal individuals tollowing the administration of 100 grams of glucose. He found the average of these to be fasting blood sugar 0.09 grams at one half hour the peak of 0.140 grams, one hour, 0.120 grams, two hours, 0.110 grams and at the end of three hours, 0.09 grams (This curve plotted on Chart No 2 in a broken line)

As early as 1912 Herrick' in reporting a case of diabetes insipidus reports having given the patient on one day 100 grams of glucose with no subsequent glycosuria. On the two succeeding days he administered 200 and 300 grams of glucose respectively with no lycosuma Gibson10 in 1921 reported a case (see Table No 1) in which he found the fasting blood sugar 0 093 grams and two hours after administering 100 grams of glucose by mouth the blood sugar was 0 092 grams This is a strong normal according to John In the same year Rabinowitch11or Montreal report ed a case (Tab'e Vo 1) on whom he did double sugar tolerance curves recommended by Ham mon and Hirschmann12 in 1919. The peak was reached at the first hour, 0 206 grams, and it had returned to fasting level in three hours second curve followed the path of the first is a weak normal curve. In 1923 Major13 reported a case in which the tasting blood sugar was 138 grams and after four hours the blood sugar was 157 grams. This is a diabetic curve Hall14 in reporting a case after giving 200 grams

TABLE NO 1

Tabulated Summary of the Isterature According to the Classification of John

			~~	_		~	
		15	3	2 _	5	3	
				2		or 33%	
				y	cases (	or 66%	

of glucose had a normal curve Allen and Sherrillis in 1923 reported four cases with sugar tolerance tests on three, one was normal and the other two were weak normal or prediabetic curves Gibson's in 1927 reported seven cases in which one showed a strong normal curve, one a normal curve, two showed weak normal curves, and three showed true diabetic curves. In this case which I observed the sugar tolerance curve was a true diabetic curve

All of these case reports are arranged according to the classification of John and tabulated in

<sup>\*</sup> For criteria, see article 7 of bibliography

Table No. 1. There are fourteen cases from the literature and my own makes a total of 15 cases. Three showed strongly normal tolerance for sugar. Two showed normal tolerance. Thus a total of five cases, or 331/3%, showed normal tolerance. Five cases showed weakly normal or prediabetic curves. Also five cases showed distinctly diabetic curves with marked intolerance for sugar. Thus 663/3% showed impaired tolerance for glucose.

Effects of Pituitrin: Pituitary extracts put up by the commercial houses have for several years been known to be effective in the temporary alleviation of the polyuria in diabetes insipidus. In 1912 Herrick<sup>®</sup> reported a case which was excreting 10 liters per day and after a single lumbar puncture, the volume output fell to 1.5 liters. Subsequently by pituitrin injections the volume was further reduced to 0.9 liters. In 1913 Von der Velden<sup>17</sup> reported a similar action with subcutaneous injections of "pituglandol." He also claimed some resultant effect by giving this substance by mouth. There are numerous other workers who have reported a temporary reduction of the polyuria by subcutaneous injections of pituitrin. These are included in the bibliography Nos. 18 to 30. Mozfelt<sup>31</sup>, also reported this effect with subcutaneous injections of pituitary extract but in addition reported three cases claiming a similar effect by administering fresh whole ox gland by mouth. This has not been reported by anyone else. Gibson and Martin<sup>10</sup> report checking polyuria with pituitary extract given subcutaneously and a similar but milder effect was noticed with histamine injections but only a very slight immediate effect was noticed when the dry whole gland was given by mouth. This was substantiated by Kennaway and Mattram,33 and Miller.26 In 1917 Williams34 Barker and Mosenthal35 and Grundman36 reported antidiuretic effects with extracts of the posterior lobe of the gland only. Kennaway and Mattram<sup>33</sup> reported two cases. In one they did get antidiuretic effect with the subcutaneous injections; in the other they did not. In 192237 Bloomgart reported marked effect by administering extract intranasally as well as subcutaneously. This was repeated with similar results by Allen and Sherrill<sup>15</sup> in four cases in 1923.

In this case the volume excreted in 24 hours before giving pituitrin was 16 liters. Two injections of 0.5 cc given twelve hours apart for three days gave on the first day a volume of 16 liters, on the second day 17 liters, and on the third day 13 liters. The next day a single dose was given (1 cc) and the volume was 21.5 liters. The following day 1 cc was given twice a day and on the second, third and fourth days, full specimens collected measured 14.14 and 19 liters respectively. After this, due to the incontinence of the patient, the volumes were unreliable,

### SCABIES AND TINEA

### By EUGENE F TRAUB, MD, NEW YORK, N Y

TENERALLY, very little difficulty is ex T perienced in arriving at a clinical drig nosis of Scabies, particularly in a nontreated individual In this instance, however, there were several interesting and rather unusual features which made a clinical diagnosis almost impossible. What seemed at first glance to be a typical case of Scabies was cast into doubt on more careful examination by the wide spread distribution of the eruption Not only were the usual areas involved in the average adult with Scabies, but the eruption extended well up on the back and neck, and on the legs and plantar surfaces of the feet The deep vesicular lesions on the hands and feet suggested the possibility of a This diagnosis, however, left the body eruption to be accounted for, and although part of this could readily be explained on the basis of a toxic absorption from the Tinea, the so called Dermatophytid, here again the condition seemed to be too widespread for this to be feasible Dermatophytid eruptions on the body have been commonly noted in the past in conjunction with cases of Tinea Capitus More recently they have been found not infrequent in severe cases of Tinea of the hands and feet

In an attempt to establish the diagnosis in this case, a vesicle roof taken from the instep of the left foot was examined and found to be loaded with branching mycelia and mosaic forms the same preparation, but in another field, a fe male Sarcoptes scabier with many eggs was found In examining several other specimens taken from lesions on the wrists and hand, neither Tinea nor acari were found. Owing to the rarity of scabetic lesions on the plantar surface of an adult's foot, it would seem likely that the Tinea was the pre existing condition in this location other hand, the history is definite that the body eruption-the scabies-first appeared source of intection no doubt was through the husband from the boy's camp and it is well possible that both infections were acquired at the same time

### CASL REIGHT

Mrs C C A, a private patient, 33 years of age, born in United States Her family and past history have no bearing on the present condition which began in June, 1928 She apparently caught an itchy dermatosis from her husband (director of a boy's camp) who complained of an eruption on his feet and legs. As the husband was two texamined, the exact inture of his erup-tion was never determined. The wife states that about the same time her generalized papulo vesicular eruption developed on the lody, a severe vesiculo pustular eruption appeared on the hands Ten to fourteen days atter the onset, her feet became involved in a deep seated vesicular erup tion which secondarily became purulent The itching was generalized and worse at night had had no local treatment

### PATIENT PRESENTED

A generalized eruption involving entire body, only sparing the face and scalp The trunk, including the neck, arms and legs was studded with minute lesions consisting mainly of papules and a few tiny vesicles The lesions on the neck, be cause of a nuld inflammatory appearance, par ticularly suggested a toxic eruption, a dermato As the lesions were so diffuse, it was rather difficult to say that the breasts, anterior axillary folds, the girdle region, etc., were particularly affected as in a typical Scabetic infection

The wrists and hands as well as the ankles and fect were covered with many large, deep seated vesicles which later apparently had become secondarily infected and were now purulent. On the left hand, near the base of the thumb and on the left wrist, there were what appeared to be several deep vesicles in a row giving somewhat the appearance of a burrow or cumculus. It is possible that they may have been burrows, but on removal of the vesicle, separate and distinct deep scated vesicles could be made out rather than the tortuous superficial thread like channel constituting the cuniculus. All other lesions on the hands

and feet were deep seated single vesicles or vesicopustules. A few single lesions between the toes were equally suggestive of Scabies or Tinea.

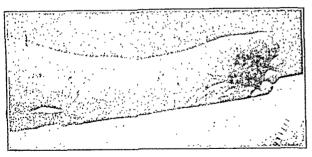

FIGURE 1
Showing lesion on instep of left foot from which specimen was obtained.

The patient was given calamine lotion containing both phenol and ichthyol to be used generally over the body, and an ointment of 10% Balsum of Peru and 10% precipitated sulphur in a cold cream base. This was used only for three days and in turn replaced by the soothing lotion first

FIGURE 2

used. It was necessary to repeat the body ointment for a second three-day period. At the end of three weeks, the patient reported that except for some red stains on the hands and about the heels, the eruption had entirely disappeared.

### Conclusion

The case reported is one of several which has been seen in which Tinea has been present in the

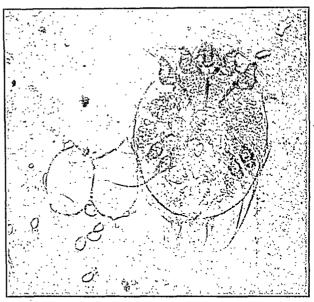

FIGURE 3
High power view of sarcoptes scabiei and eggs.

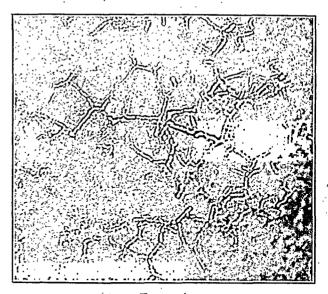

Figure 4

High power view of branching mosaic forms; characteristic mycelia found in another field.

same lesions with another skin eruption. More frequent and more careful microscopic examinations, especially in cases where the clinical picture is not clean cut, would no doubt prove that these cases are not too infrequent.

### ACUTE SURGICAL CONDITIONS OF THE ABDOMEN\*

By ARTHUR M. DICKINSON, M. D., ALBANY, N. Y.

N acute surgical conditions of the abdomen, due either to disease or injury, we are confronted with a mortality rate that is too high for this age of medical progress. Early recognition of disease and early and proper surgical treatment are required if this rate is to be favorably influenced. We have seen how much has been accomplished by early recognition and treatment in appendicitis and in intestinal obstruction but there is still a large field for improvement in most acute surgical conditions of the abdomen. Upon us as practicing physicians, the responsibility rests. Time seems to be the most important factor: delay in diagnosis and treatment means a high mortality. Oftentimes a definite diagnosis cannot be made but in these acute conditions of the abdomen, we should not delay treatment for When we have satisfied ourselves that we are dealing with an acute abdominal emergency which requires surgical treatment, this must be promptly provided. True we do not like to rush patients to the operating room with such a loose diagnosis as an acute surgical abdomen but in some instances, accurate diagnosis must wait upon surgical exploration.

In arriving at a diagnosis of any acute surgical condition of the abdomen, the history is of great importance. In many instances it is of greater importance than the physical findings. Few of these acute catastrophes except the traumatic ones, occur without some previous warning. The ruptured ulcer case will give a history of gas on the stomach or elimination of certain articles of food from the dietary, even though no medical advice was sought. It is to our advantage to secure all of these details we can; they will often point the way to the diagnosis. The patient should be interrogated carefully about his past history but when he comes to the present illness, we must let him tell his own story. After he has finished we may question him to obtain more details of what we consider the important points The duration of the present attack should be ascertained at the outset. An appendix case in the first few hours presents quite different symptoms than one several days old; the same is true of all conditions. However, this is sometimes forgotten when we attempt to make a diagnosis. We must always bear in mind that some chest conditions may give symptoms suggesting abdom-inal disease. Pneumonia in children has been treated too frequently by removal of the appendix and disease of the coronary vessels in adults has been too frequently interpreted as gall bladder disease. In the traumatic case we must ascertain the nature and method of injury.

small object striking the abdominal wall generally causes injury immediately underneath while a large object will cause injury to more distant organs.

organs.

Though most of the following remarks are directed to the application of our diagnostic powers to the abdomen, we must not forget the value of giving our patient a quick comprehensive general physical examination. The conditions of the patient's tongue should always be noted, for the tongue is the barometer of the intestinal tract. The coated tongue bespeaks some intestinal condition; the clean moist tongue argues against serious intestinal disease; the dry tongue shows at once that the patient is badly in need of fluids. Careful chest examination will eliminate the possibility of disease of the heart or lungs causing reflex abdominal symptoms. The simple testing of eye reflexes or knee jerks may save the patient with a gastric crisis of tabes from abdominal exploration. We should always remember to do either a rectal or vaginal examination on our patient too. This simple but often neglected procedure will frequently give us findings that clinch the diagnosis.

In dealing with any acute surgical condition of the abdomen, we have six diagnostic signs which are of considerable importance and a proper appreciation of which will often lead us to the diagnosis. These are pain, vomiting, tenderness, pulse changes, temperature changes and spasm or rigidity. There are other signs such as facial expression, color of skin, abdominal distention, etc., but these six are the most important in the early stages of the process, while the others appear later and may be serious omens. Pain is usually an outstanding symptom of any acute surgical condition of the abdomen. onset is commonly very sudden; it may at first be slight but as a rule soon becomes intense. By far the most common site of pain is in the region of the umbilious with the onset of the disease; later it may localize over the region of the offending organ. It may be cramplike as is seen in the colics of renal, hepatic or intestinal origin or it may be severe and constant as is seen in ruptured ulcers. While discussing pain, it may not be amiss to recall that the patient with biliary or renal colic rolls and tosses about in his agony in contradistinction to the patient with the ruptured ulcer who guards his whole body against the slightest movement. This observation is not constant however, for I recently operated upon a patient with an acute surgical abdomen who presented the picture of a colic but who had a ruptured gastric ulcer. Of course different patients react differently to pain. The stoic may suffer severe pain and complain little while the nervous, high strung individual will complain most bit-

<sup>\*</sup> Presented before the Annual Meeting of the Greene County Medical Society, at Cairo, N. Y., October 8, 1929.

terly of relatively slight pain. We must take this difference into consideration. constitutional Sometimes we can measure pain by the amount of relief afforded by morphine. The patient with real severe pain will often accept two or three one-quarter grain doses before relief is secured. This statement should not be interpreted however to advise the use of morphine before a diagnosis is made for we all realize how morphine can change the picture, often rendering a diagnosis impossible. Pain is probably the most important and constant symptom of acute abdominal disease.

Vomiting is usually present in most of these conditions too. It occurs shortly after the onset of pain. It may continue at intervals or may cease after a short time. Vomiting of intestinal contents usually signifies obstruction of the intestine but is a late symptom. The patient with a high intestinal obstruction often vomits only 4 or 5 times in the 24 hours, due to the fact that the dilated stomach accepts large quantities of fluid before it rebels. The absence of vomiting must not be taken as an indication of safety for we have all seen the patient with a gangrenous appendix who did not vomit. Vomiting is largely reflex of course. If at the onset of the pathological process, the stomach is full, vomiting will occur while if it is empty, vomiting will not appear until later.

Tenderness is an important sign usually found in the acute surgical conditions of the abdomen. It may be superficial or deep. Superficial tenderness is really a cutaneous hyperesthesia. It may be elicited by pinching or rubbing the skin; it is a reflex phenomenon; while it has some diagnostic value it is not always dependable. Deep tenderness is of much more value. It is commonly found directly over the organ involved. At first it may be more generalized but as the disease localizes, it becomes more circumscribed. The so called rebound tenderness, is elicited by sudden release of pressure over the tender area. It probably has no more significance than deep tenderness.

The rate and volume of the pulse are of considerable value in diagnosing these conditions. While there are recorded instances where a severe abdominal catastrophe has occurred and the pulse remained apparently normal in rate and volume, these are in the minority. The pulse rate commonly rises with the progress of the disease and for that reason, frequent takings of the pulse are often of value whereas a single recording is valueless. A pulse rate higher in proportion than the temperature means progressing infection with low resistance and so is a bad prognostic sign. For the first few hours after the onset of the disease there will probably be little or no change in the temperature. Then there will be an elevation to 99 or 100. Temperatures higher than this mean spreading infection and are rarely seen in the acute surgical conditions of the abdomen until late. A subnormal temperature in the face of an obvious severe abdominal condition is indicative of shock in the early stages; later it is evidence of lack of resistance.

Spasm and rigidity are usually encountered in acute surgical conditions of the abdomen. They are part of the defense mechanism of nature and are true objective signs. In the very early stages they may be absent or slight but they soon appear in the area overlying the affected organ. If the process becomes more generalized, then the spasm and rigidity increase and vice versa. Spasm and rigidity will vary with the nature and location of the process. The almost boardlike rigidity seen with the ruptured ulcer case differs markedly from the slight spasm seen with the mild appendix case. The retrocecal appendix. though badly diseased may give rise to but little spasm and rigidity. Rigidity without tenderness strongly suggests that the pathological process is not in that particular region. It should make us look carefully to other parts, particularly the

We will now consider some of the more common acute surgical conditions of the abdomen in detail. In general the statement may be made that the persistence of abdominal pain for more than six hours, in a person previously well, if accompanied by vomiting or a rising pulse rate or a rising temperature, indicates an acute surgical condition of the abdomen. If there still be doubt we might better err on the side of safety and operate. Dr. C. H. Mayo has said that he has never seen a patient die because of having an exploratory operation but that he has seen many die because they did not have explorations. Of course we recognize that kidney conditions may duplicate the picture created above and we know that few acute gall bladders require immediate surgery; also we feel that acute salpingitis should not be operated upon. These are the common exceptions to the rule. By constantly keeping this rule in mind, we will be much less likely to allow serious and often fatal delays to

Acute appendicitis is a disease both of children and adults. The acute attack usually comes on out of a clear sky with a stomachache or cramplike pains diffusely distributed. Nausea and vomiting follow the appearance of pain rather promptly but may be entirely absent in the occasional case. After the stomach is emptied, if no food is taken, vomiting stops. Return of the vomiting later means extension of the process or intestinal obstruction. In a few hours after onset, the cramplike pains gradually merge into a steady aching pain, located in the lower right quadrant. This behavior of the pain is very characteristic of appendicitis, pain being the most prominent

and characteristic symptom encountered. to pain comes tenderness. At the onset of the acute attack it is general; it soon becomes localized to the area over the appendix; later if spreading infection occurs the tenderness increases correspondingly. Of course the location of the pain and tenderness will vary with the site of the appendix. If the appendix is of the retrocecal type, pain and tenderness will be found in the loin; if there is partial nondescent and rotation of the cecum as seen in children, the location will be higher and more toward the midline. Rigidity is usually dependent upon pain and tenderness; the greater these are the more marked the rigidity. It is present on both sides of the abdomen but more marked over the right side. As a rule the elevation of temperature in acute appendicitis is slight, ranging from normal to 100./ The pulse commonly parallels the temperature. A high temperature at the beginning of the attack throws suspicion on the correctness of the diagnosis: if combined with a slow pulse it suggest typhoid fever; if there are urinary symptoms it suggests a pyelitis. Rectal or vaginal examination will often disclose a tender mass in the region of the appendix. In children acute appendicitis often has a more insidious onset and usually runs a more rapid course. Early diagnosis is more difficult because of our inability to obtain a satisfactory history. Children seem to show the tendency to draw up the right leg more frequently than adults. The child with an acute appendix will not allow you to touch him as a rule; he will brush away your hand as you strive to palpate the abdomen; the child who has not serious abdominal disease generally does not do this. This apparently trival observation has saved me from many an error.

Perforation of a gastric or duodenal ulcer may occur as a sudden acute catastrophy or may be more gradual. The former is more common. At the time of an acute perforation, the pain is terrific; it feels as if a sharp knife was being run through the body; the patient holds himself very still and guards against the slightest of movements. The pain is localized in the epigastrium. Vomiting usually follows until the stomach is empty; if food is taken later it is rejected. For several hours after rupture of the ulcer, there is commonly no change in the pulse or temperature which tends to put us off guard and makes for delay. Tenderness is most marked over the region of the perforation; it is both superficial and deep. The entire upper abdomen becomes rigid as the muscles strive to protect the underlying organ. In the subacute type of perforation, the symptoms are not so striking or clear for the process is a more gradual one. In the early stages of an acute perforation, it is difficult to distinguish between the gastric and duodenal variety. As time passes there are differences however. The ruptured gastric ulcer tends to cause a more generalized peritoneal irritation while the ruptured duodenal ulcer, due to the fact that the drainage generally runs down the outer side of the right colon, only irritates the right side at first In a few hours the symptoms merge again. It matters little however, to patient or physician, for treatment is exactly the same in either instance. As the process continues with either type of ulcer, we note more generalized pain and rigidity, slight elevation of temperature and usually a rapidly climbing pulse. The facial expression of the patient with a ruptured ulcer, early leaves no doubt in the mind of the observer that a serious condition exists; it is pale and pinched and anxious-much different than we see with other acute abdominal conditions except acute pancreatitis. In cases of ruptured ulcer, we can often by careful questioning elicit the fact that the patient has had some gastric distress previously even though it was not severe enough to warrant his seeking treatment.

In discussing acute intestinal obstruction, we will confine ourselves to those cases in which there is mechanical obstruction and not consider the paralytic or dynamic type. The most common cause of acute intestinal obstruction is hernia. It is surprising to note the frequency with which an apparently innocent hernia is responsible for an obstruction. A few weeks ago I saw a patient who was complaining of nausea and vomiting of 24 hours duration. All I found upon examination was a recurrent left inguinal hernia. It was not tender and seemed to reduce with gentle manipulation. The patient assured me that it went back all right at night. After the vomiting persisted another 24 hours with no other developments, I insisted upon operation and found a loop of illeum adherent to the hernia sac. Intussusception in children is a common cause of obstruction; though uncommon in adults it does occur as a recent experience illustrates. This was a patient, who after a night spent in consuming hootleg whiskey, commenced to vomit and have pain in the abdomen. Persistence of symptoms led to exploration and we found an intussesception in the ileum. Peritoneal adhesions, usually post operative are frequent causes. When we see a patient with symptoms of an obstruction, who has been operated upon before, this is our first thought. We must not forget that there may be other factors. A recent case illustrates this point well. A patient who one year previously had had an appendectomy, was admitted to hospital with an acute obstruction. At operation, a localized peritoneal abscess was found in addition to the obstructed gut. The abscess was drained and an enterostomy for relief of the obstruction done. After some six weeks the wound healed and bowel movements commenced by rectum. One month later, acute obstruction again supervened,

the enterostomy commenced to drain without interierence and a tumor like outgrowth appeared in the operative scar. Sections of this showed malignancy and so without much doubt, the primary obstruction was due to tumor rather than to adhesions. Foreign bodies such as gall stones, fecaliths, etc. also cause obstruction. Volvulus may be a cause. Malignant tumors while usually resulting in the chronic type of obstruction, occasionally cause the acute variety. The symptoms of acute intestinal obstruction seem to depend but little upon the causitive factor. The higher the site of obstruction, the more rapid the onset and the more severe are the symptoms. The diagnostic symptoms are pain, vomiting and constipation. The pain is commonly severe; it is often referred to the epigastric or umbilical regions at first and later may be over the site of the obstruction. It occurs in severe paroxysms and is of the colic type. Between the paroxysms, the pain is dull. Vomiting is present and is persistent; at first the vomitus consists of stomach contents and later of intestinal or fecal material. The onset of fecal vomiting is a sign of serious import. Constipation is present. True the patient may have bowel movements until that part of the intestinal tract below the site of obstruction is emptied; after that, obstipation is complete. As a rule here is little or no change in the pulse or temperature for the first 24 hours. As the process progresses, the pulse becomes softer, due, to fluid loss and more rapid, due to toxemia while the temperature remains normal or subnormal. Abdominal distention, visible coils or patterns and rigidity and spasm are late symptoms. Their presence is a bad sign.

Acute gall bladder disease is rarely a condition requiring immediate surgical treatment. Symptoms will depend upon whether we are dealing with a stone in the cystic or common duct and upon the presence or absence of infection. Infection in the gall bladder tends to localize more frequently than infection elsewhere in the peritoneal cavity and so unless there are symptoms of rapidly spreading infection, the acute gall bladder should not be hurriedly operated upon. The acute gall bladder attack usually commences with severe agonizing pain in the upper right quadrant. It is colicy in type and is often referred to the right shoulder blade. Vomiting commonly follows the appearance of pain. It soon ceases unless there is spread of the disease beyond the gall bladder. There is marked tenderness over the region of the gall bladder. Sometimes the distended viscus can be palpated if tenderness is slight. In the absence of infection there is but slight change in the pulse and temperature. Chills followed by fever suggest extending infection. Marked spasm and rigidity may be noted over the upper abdomen, especially on the right side. As the process localizes, the area of tenderness and

spasm diminishes noticeably. With obstruction to the common duct, jaundice appears. The patient with an acute gall bladder condition can be observed for some time with safety. If the process appears to be subsiding, then operation should be deferred until the quiescent stage is reached; if on the other hand the process is progressing then operation should not be withheld.

Acute pancreatitis is the most severe of the sudden abdominal catastrophies with which we have to contend. We recognize three types of classes of the disease This classification is based on the degree of the process rather than on the etiology. The three types of the disease are the hemorrhagic, gangrenous and suppurative. The hemorrhagic type is often rapidly fatal while the other types are less serious. The symptoms of all three types are the same, varying only in intensity. It is well to recall that acute pancreatitis is usually seen in the overweight male and comes on just after eating a large meal. The first symptom is pain. This pain is probably the most agonizing that humans suffer. It is constant, not colicy. It is located in the epigastrium and may be referred to the back and loins. As a result of the terrific pain, collapse of the patient occurs with a rising pulse of small volume. The patient becomes cold and blue; he looks as if the end was near. Vomiting comes on immediately and may be continous but nothing except stomach and duodenal contents are ejected. Very early there is marked spasm and rigidity of the upper abdomen; distention of the epigastrium appears promptly. Tenderness is most marked to the left of the midline and above the umbilicus. If the attack is as severe as pictured, the temperature remains subnormal. In less severe attacks the symptoms are more subdued; vomiting continues and distention increases; the temperature will rise Acute pancreatitis is a real surgical to 102. emergency and demands prompt operation.

Extra uterine pregnancy frequently constitutes a surgical emergency. The diagnosis is not made so frequently before rupture; if it was there would be no emergency. We will limit our discussion to the ruptured extra uterine pregnancy. Here the diagnosis is more simple, and prompt treatment is necessary. There is commonly a history of a missed period, in a person who has been previously sterile or has had only one child. With the occurrence of the rupture there is agonizing pain on one or the other side of the pelvis. This is accompanied by vomiting, fainting and collapse. There is a rapid feeble pulse and a subnormal temperature. The patient presents the signs of hemorrhage-palor, thirst and air hunger. Tenderness is found over the side of the ruptured This is accompanied by rigidity. Soon the pain decreases and abdominal distention appears. Then there may be slight elevation in temperature. Many of these patients die unless proper treatment is given promptly. It is a very remarkable fact on the other hand how quickly they commence to improve once the bleeding tube is cared for.

Acute pelvic inflammatory disease is rarely surgical but will be briefly mentioned from the viewpoint of differential diagnosis. These patients usually give a history of vaginal discharge and burning on urination; the acute onset often follows the cessation of menstruation. Pain is always complained of and is usually bilateral and located deep in the pelvis. The fact that it is bilateral is an important diagnostic point. Vomiting often occurs but commonly is not persistent or outstanding. There is marked tenderness over the region of the tubes. Spasm and rigidity are relatively slight, being limited to the region of the pelvis. The temperature is usually high—102 or more—and the pulse elevated accordingly. It will be noted that the temperature is much higher than that seen with those conditions of the abdomen which require immediate surgical treatment. The general opinion today seems to be that acute inflammatory disease of the pelvis should not be operated upon in the active stage unless drainage

of a large abscess be required.

Injuries to the abdomen may result in conditions requiring immediate surgical attention so it is proper that we consider them in discussing acute surgical conditions of the abdomen. In general wounds of the abdomen may be divided into penetrating and non-penetrating. The diagnosis and severity of the former is usually more obvious than of the latter. Moynihan, the peer of English surgeons, makes this statement "Any surgeon whose experience of hospital work is extensive will have realized the great difficulty that almost always exists in discriminating in the early stages, between those cases of abdominal injury which are trivial, and those in which laceration of the intestine has occurred." In general it may be stated that the persistence of abdominal pain for more than 6 hours after injury, if accompanied by vomiting or a rising pulse or increasing rigidity is an indication for exploration. In dealing with any injury case we must consider the nature of the injury. A force applied over a small area commonly results in damage to the organ immediately beneath, while a diffuse blow or crushing injury will cause damage at the fixed points of organs, such as the mesentery or pedicles, which are more distant. The patient with severe intraabdominal injury complains of severe
